A WORD TO THE READER

The student who has come to philosophy under the spur of Plato's eloquence will need some encouragement to face the more practical and prosaic work of Aristotle. If he finds the following essay difficult and unattractive, let him reflect that Aristotle's is almost the most abstract and obscure of all the great philosophies; and that only the exigencies of logical and chronological sequence have led us to study him before mastering simpler systems. Aristotle is hard to grasp because his work is so varied and manifold that no centralizing unity can be found to co-ordinate it for easier comprehension. Nor is there in his work any enthralling drama of passionate reform; he is a man of the world who has become almost reconciled to the eternity of human imperfections. The author has spared neither time nor labor to make out under the mummy-like mass of lecture notes in which Aristotle has come down to us, the features of the living man; but he is very much afraid that he has failed.

W. D.

THE STORY OF ARISTOTLE'S PHILOSOPHY

I. THE HISTORICAL BACKGROUND

Aristotle was born at Stagira, a Macedonian city some two hundred miles to the north of Athens, in the year 384 B. C. His father was friend and physician to Amyntas, King of Macedon and grandfather of Alexander. Aristotle himself seems to have become a member of the great medical fraternity of Asclepiads. He was brought up in the odor of medicine as many later philosophers were brought up in the odor of sanctity; he had every opportunity and encouragement to develop a scientific bent of mind; he was prepared from the beginning to become the founder of science.

We have a choice of stories for his youth. One narrative represents him as squandering his patrimony in riotous living, joining the army to avoid starvation, returning to Stagira to practice medicine, and going to Athens at the age of thirty to study philosophy under Plato. A more dignified story takes him to Athens at the age of eighteen, and puts him at once under the tutelage of the great Master; but even in this likelier account there is sufficient echo of a reckless and irregular youth, living rapidly.¹ The horrified reader may console himself by observing that in either story our philosopher anchors at last in the quiet groves of the Academy.

Under Plato he studied eight—or twenty—

¹Grote, *Aristotle*, London, 1872, p. 4; Zeller, *Aristotle and the Earlier Peripatetics*, London, 1897, vol. i, pp. 6f.

years; and, indeed, the pervasive Platonism of Aristotle's speculations—even of those most anti-Platonic—suggests the longer period. One would like to imagine these as very happy years: a brilliant pupil guided by an incomparable teacher, walking like Greek lovers in the gardens of philosophy. But they were both geniuses; and it is notorious that geniuses accord with one another as harmoniously as dynamite with fire. Almost half a century separated them; it was difficult for understanding to bridge this gap of years and cancel the incompatibility of souls. Plato recognized the greatness of this strange new pupil from the supposedly barbarian north, and spoke of him once as the *Nous* of the Academy,—as if to say, Intelligence personified. Aristotle had spent money lavishly on the collection of books (that is, in those printless days, manuscripts); he was the first, after Euripides, to gather together a library, and the foundation of the principles of library classification was among his many contributions to scholarship. Therefore Plato spoke of Aristotle's home as "the house of the reader," and seems to have meant the sincerest compliment; but some ancient gossip will have it that the Master intended a sly but vigorous dig at a certain book-wormishness in Aristotle. A more authentic quarrel seems to have arisen towards the end of Plato's life. Our ambitious youth apparently developed an "Œdipus complex" against his spiritual father for the favors and affections of philosophy, and began to hint that wisdom would not die with Plato; while the old sage spoke of his pupil as a foal that kicks his mother after draining her dry.² The learned Zeller,³ in

²Benn, *The Greek Philosophers*, London, 1882, vol. i, p. 283.

³Vol. i, p. 11.

whose pages Aristotle almost achieves the Nirvana of respectability, would have us reject these stories; but we may presume that where there is still so much smoke there was once a fire.

The other incidents of this Athenian period are still more problematical. Some biographers tell us that Aristotle founded a school of oratory to rival Isocrates; and that he had among his pupils in this school the wealthy Hermias, who was soon to become autocrat of the city-state of Atarneus. After reaching this elevation Hermias invited Aristotle to his court; and in the year 344 B. C. he rewarded his teacher for past favors by bestowing upon him a sister (or a niece) in marriage. One might suspect this as a Greek gift; but the historians hasten to assure us that Aristotle, despite his genius, lived happily enough with his wife, and spoke of her most affectionately in his will. It was just a year later that Philip, King of Macedon, called Aristotle to the court at Pella to undertake the education of Alexander. It bespeaks the rising repute of our philosopher that the greatest monarch of the time, looking about for the greatest teacher, should single out Aristotle to be the tutor of the future master of the world.

Philip was determined that his son should have every educational advantage, for he had made for him illimitable designs. His conquest of Thrace in 356 B. C. had given him command of gold mines which at once began to yield him precious metal to ten times the amount then coming to Athens from the failing silver of Laurium; his people were vigorous peasants and warriors, as yet unspoiled by city luxury and vice: here was the combination that would make possible the subjugation of a hundred petty city-states and the political unification

of Greece. Philip had no sympathy with the individualism that had fostered the art and intellect of Greece, but had at the same time disintegrated her social order; in all these little capitals he saw not the exhilarating culture and the unsurpassable art, but the commercial corruption and the political chaos; he saw insatiable merchants and bankers absorbing the vital resources of the nation, incompetent politicians and clever orators misleading a busy populace into disastrous plots and wars, factions cleaving classes and classes congealing into castes: this, said Philip, was not a nation but only a welter of individuals,—geniuses and slaves; he would bring the hand of order down upon this turmoil, and make all Greece stand up united and strong as the political center and basis of the world. In his youth in Thebes he had learned the arts of military strategy and civil organization under the noble Epaminondas; and now, with courage as boundless as his ambition, he bettered the instruction. In 338 B. C. he defeated the Athenians at Chaeronea, and saw at last a Greece united, though with chains. And then, as he stood upon this victory, and planned how he and his son should master and unify the world, he fell under an assassin's hand.

Alexander, when Aristotle came, was a wild youth of thirteen: passionate, epileptic, almost alcoholic; it was his pastime to tame horses untamable by men. The efforts of the philosopher to cool the fires of this budding volcano were not of much avail; Alexander had better success with Bucephalus than Aristotle with Alexander. "For a while," says Plutarch, "Alexander loved and cherished Aristotle no less than as if he had been his own father; saying that though he had received life from the one, the other had taught him the art of liv-

ing." ("Life," says a fine Greek adage, "is the gift of Nature; but beautiful living is the gift of wisdom.") "For my part," said Alexander in a letter to Aristotle, "I had rather excel in the knowledge of what is good than in the extent of my power and dominion." But this was probably no more than a royal-youthful compliment; beneath the enthusiastic tyro of philosophy was the fiery son of a barbarian princess and an untamed king; the restraints of reason were too delicate to hold these ancestral passions in leash; and Alexander left philosophy after two years to mount the throne and ride the world. History leaves us free to believe (though we should suspect these pleasant thoughts) that Alexander's unifying passion derived some of its force and grandeur from his teacher, the most synthetic thinker in the history of thought; and that the conquest of order in the political realm by the pupil, and in the philosophic realm by the master, were but diverse sides of one noble and epic project—two magnificent Macedonians unifying two chaotic worlds.

But as usual, impersonal economic factors lay hidden under the surface of personal and dramatic events. The development of commerce had bound the Mediterranean nations, from Persia to Spain, into one great web of trade; and this commercial unity, harassed in a thousand ways by political frontiers, autocratic tolls, and the vicissitudes of unprotected transport, called insistently for unity of political and military administration. Persia controlled the Asiatic land routes of the eastern half of this economic system; Greece (or, since Philip, Macedon) controlled the Mediterranean sea-routes of the western half. It appeared to Alexander that the absorption of one of these political systems by the other was made in-

evitable by the growing pressure of economic circumstance. Hence his reply to the Persian embassy which came to him from Darius, suggesting conciliation and division of rule: "As it would be impossible for order to reign in the world with two suns, so it is impossible for the earth to be at peace with two masters." And so he set out, in the year 334 B. C., to conquer Persia. Three years later the task was accomplished, and the Mediterranean world was one.

He had left behind him, in the cities of Greece, governments favorable to him but populations resolutely hostile. The long tradition of a free and once imperial Athens made subjection—even to a brilliant world-conquering despot—intolerable; and the bitter eloquence of Demosthenes kept the Assembly always on the edge of revolt against the "Macedonian party" that held the reins of city power. Now when Aristotle, after another period of travel, returned to Athens in the year 334 B. C., he very naturally associated with this Macedonian group, and took no pains to conceal his approval of Alexander's unifying rule. As we study the remarkable succession of works, in speculation and research, which Aristotle proceeded to unfold in the last twelve years of his life; and as we watch him in his multifold tasks of organizing his school, and of organizing such a wealth of knowledge as probably never before had passed through the mind of one man; let us occasionally remember that this was no quiet and secure pursuit of truth; that at any minute the political sky might change, and precipitate a storm in this peaceful philosophic life. Only with this situation in mind shall we understand Aristotle's political philosophy, and his tragic end.

II. THE WORK OF ARISTOTLE

It was not hard for the instructor of the king of kings to find pupils even in so hostile a city as Athens. When, in the fifty-third year of his age, Aristotle established his school, the Lyceum, so many students flocked to him that it became necessary to make complicated regulations for the maintenance of order. The students themselves determined the rules, and elected, every ten days, one of their number to supervise the School. But we must not think of it as a place of rigid discipline; rather the picture which comes down to us is of scholars eating their meals in common with the master, and learning from him as he and they strolled up and down the Walk along the athletic field from which the Lyceum took its name.⁴

The new School was no mere replica of that which Plato had left behind him. The Academy was devoted above all to mathematics and to speculative and political philosophy; the Lyceum had rather a tendency to biology and the natural sciences. If we may believe Pliny,⁵ Alexander instructed his hunters, gamekeepers, gardeners and fishermen to furnish Aristotle with all the zoological and botanical material he might desire; other ancient writers tell us that at one time he had at his disposal a thousand men scattered throughout Greece and Asia, collecting for him specimens of the fauna and flora of every land. With this

⁴The Walk was called *Peripatos*; hence the later name, Peripatetic School. The athletic field was part of the grounds of the temple of Apollo Lyceus—the protector of the flock against the wolf (*lycos*).

⁵*Hist. Nat.*, viii, 16; in Lewes, *Aristotle, a Chapter from the History of Science*, London, 1864, p. 15.

wealth of material he was enabled to establish the first great zoological garden that the world had seen. We can hardly exaggerate the influence of this collection upon his science and his philosophy.

Where did Aristotle derive the funds to finance these undertakings? He was himself, by this time, a man of spacious income; and he had married into the fortune of one of the most powerful public men in Greece. Athenaeus (no doubt with some exaggeration) relates that Alexander gave Aristotle, for physical and biological equipment and research, the sum of 800 talents (in modern purchasing power, some \$4,000,000).⁶ It was at Aristotle's suggestion, some think, that Alexander sent a costly expedition to explore the sources of the Nile and discover the causes of its periodical overflow.⁷ Such works as the digest of 158 political constitutions, drawn up for Aristotle, indicate a considerable corps of aides and secretaries. In short we have here the first example in European history of the large-scale financing of science by public wealth. What knowledge would we not win if modern states were to support research on a proportionately lavish scale!

Yet we should do Aristotle injustice if we were to ignore the almost fatal limitations of equipment which accompanied these unprecedented resources and facilities. He was compelled "to fix time without a watch, to compare degrees of heat without a thermometer, to observe the heavens without a telescope, and the weather without a barometer. . . . Of all our mathematical, optical and physical instruments he possessed only the rule and compass,

⁶Grant, *Aristotle*, Edinburgh, 1877, p. 18.

⁷The expedition reported that the inundations were due to the melting of the snow on the mountains of Abyssinia.

together with the most imperfect substitutes for some few others. Chemical analysis, correct measurements of weights, and a thorough application of mathematics to physics, were unknown. The attractive force of matter, the law of gravitation, electrical phenomena, the conditions of chemical combination, pressure of air and its effects, the nature of light, heat, combustion, etc.; in short, all the facts on which the physical theories of modern science are based were wholly, or almost wholly, undiscovered."⁸

See, here, how inventions make history: for lack of a telescope, Aristotle's astronomy is a tissue of childish romance; for lack of a microscope his biology wanders endlessly astray. Indeed, it was in industrial and technical invention that Greece fell furthest below the general standard of its unparalleled achievements. The Greek disdain of manual work kept everybody but the listless slave from direct acquaintance with the processes of production, from that stimulating contact with machinery which reveals defects and prefigures possibilities; technical invention was possible only to those who had no interest in it, and could not derive from it any material reward. Perhaps the very cheapness of the slaves made invention lag; muscle was still less costly than machines. And so, while Greek commerce conquered the Mediterranean Sea, and Greek philosophy conquered the Mediterranean mind, Greek science straggled, and Greek industry remained almost where Ægean industry had been when the invading Greeks had come down upon it, at Cnossos, at Tiryns and Mycene, a thousand years before. No doubt we have here the reason why Aristotle so seldom appeals to

⁸Zeller, i, 264, 443.

experiment; the mechanisms of experiment had not yet been made; and the best he could do was to achieve an almost universal and continuous observation. Nevertheless the vast body of data gathered by him and his assistants became the groundwork of the progress of science, the text-book of knowledge for two thousand years; one of the wonders of the work of man.

Aristotle's writings ran into the hundreds. Some ancient authors credit him with four hundred volumes, others with a thousand. What remains is but a part, and yet it is a library in itself—conceive the scope and grandeur of the whole. There are, first, the *Logical* works: "Categories," "Topics," "Prior" and "Posterior Analytics," "Propositions," and "Sophistical Refutations"; these works were collected and edited by the later Peripatetics under the general title of Aristotle's "Organon,"—that is, the organ or instrument of correct thinking. Secondly, there are the *Scientific* works: "Physics," "On the Heavens," "Growth and Decay," "Meteorology," "Natural History," "On the Soul," "The Parts of Animals," "The Movements of Animals," and "The Generation of Animals." There are, thirdly, the *Esthetic* works: "Rhetoric" and "Poetics." And fourthly come the more strictly *Philosophical* works: "Ethics," "Politics," and "Metaphysics." Here, evidently, is the Encyclopaedia Britannica of Greece: every problem under the sun and about it finds a place; no wonder there are more errors and absurdities here than in any other philosopher who ever wrote. Here

*This is the chronological order, so far as known (Zeller, i, 156f). Our discussion will follow this order except in the case of the "Metaphysics."

is such a synthesis of knowledge and theory as no man would ever achieve again till Spencer's day, and even then not half so magnificently; here, better than Alexander's fitful and brutal victory, was a conquest of the world. If philosophy is the quest of unity Aristotle deserves the high name that twenty centuries gave him—*Ille Philosophus: The Philosopher*.

Naturally, in a mind of such scientific turn, poesy was lacking. We must not expect of Aristotle such literary brilliance as floods the pages of the dramatist-philosopher Plato. Instead of giving us great literature, in which philosophy is embodied (and obscured) in myth and imagery, Aristotle gives us science, technical, abstract, concentrated; if we go to him for entertainment we shall sue for the return of our money. Instead of giving terms to literature, as Plato did, he builds the terminology of science and philosophy; we can hardly speak of any science today without employing terms which he invented; they lie like fossils in the strata of our speech: faculty, mean, maxim (meaning, in Aristotle, the major premise of a syllogism), category, energy, actuality, motive, end, principle, form—these indispensable coins of philosophic thought were minted in his mind. And perhaps this passage from delightful dialogue to precise scientific treatise was a necessary step in the development of philosophy; and science, which is the basis and backbone of philosophy, could not grow until it had evolved its own strict methods of procedure and expression. Aristotle, too, wrote literary dialogues, as highly reputed in their day as Plato's, but they are lost, just as the scientific treatises of Plato have perished. Probably time has preserved of each man the better part.

Finally, it is possible that the writings at-

tributed to Aristotle were not his, but were largely the compilations of students and followers who had embalmed the unadorned substance of his lectures in their notes. It does not appear that Aristotle published in his lifetime any writings except those on logic and rhetoric; and the present form of the logical treatises is due to later editing. In the case of the *Metaphysics* and the *Politics* the notes left by Aristotle seem to have been put together by his executors without revision or alteration. Even the unity of style which marks Aristotle's writings, and offers an argument to those who defend his direct authorship, may be, after all, merely a unity given them through common editing by the Peripatetic School. About this matter there rages a sort of Homeric question, of almost epic scope, into which the busy reader will not care to go, and on which a modest student will not undertake to judge.¹⁰ We may at all events be sure that Aristotle is the spiritual author of all these books that bear his name: that the hand may be in some cases another's hand, but that the head and the heart are his.¹¹

¹⁰Cf. Zeller, ii, 204, note; Encyc. Brit., ii, 509; and Shule: *History of the Aristotelian Writings*.

¹¹The reader who wishes to go to the philosopher himself will find the *Meteorology* an interesting example of Aristotle's scientific work; he will derive much practical instruction from the *Rhetoric*; and he will find Aristotle at his best in books i-ii of the *Ethics*, and books i-iv of the *Politics*. The best translation of the *Ethics* is Welldon's; of the *Politics*, Jowett's. Sir Alexander Grant's *Aristotle* is a simple book; Zeller's *Aristotle* (vols. iii-iv in his *Greek Philosophy*) is scholarly but dry; Gomperz's *Greek Thinkers* (vol. iv) is masterly but difficult.

III. THE FOUNDATION OF LOGIC

The first great distinction of Aristotle is that almost without predecessors, almost entirely by his own hard thinking, he created a new science—Logic. Renan¹² speaks of “the ill training of every mind that has not, directly or indirectly, come under Greek discipline”; but in truth the Greek intellect itself was undisciplined and chaotic till the ruthless formulae of Aristotle provided a ready method for the test and correction of thought. Even Plato (if a lover may so far presume) was an unruly and irregular soul, caught up too frequently in a cloud of myth, and letting beauty too richly veil the face of truth. Aristotle himself, as we shall see, violated his own canons plentifully; but then he was the product of his past, and not of that future which his thought would build. The political and economic decay of Greece brought a weakening of the Hellenic mind and character after Aristotle; but when a new race, after a millennium of barbaric darkness, found again the leisure and ability for speculation, it was Aristotle’s “Organon” of logic, translated by Boethius (470-525 A. D.), that became the very mould of medieval thought, the strict mother of that scholastic philosophy which, though rendered sterile by encircling dogmas, nevertheless trained the intellect of adolescent Europe to reasoning and subtlety, constructed the terminology of modern science, and laid the bases of that same maturity of mind which was to outgrow and overthrow the very system and methods which had given it birth and sustenance.

¹²*History of the People of Israel*, vol. v, p. 338.

Logic means, simply, the art and method of correct thinking. It is the *logy* or method of every science, of every discipline and every art; and even music harbors it. It is a science because to a considerable extent the processes of right thinking (and we use "right" not in a moral but in a mathematical sense) can be reduced to rules like physics and geometry, and taught to any normal mind; it is an art because by practice it gives to thought, at last, that unconscious and immediate accuracy which guides the fingers of the pianist over his instrument to effortless harmonies. Nothing is so dull as logic, and nothing is so important.

There was a hint of this new science in Socrates' maddening insistence on definitions, and in Plato's constant refining of every concept. Aristotle's little treatise on *Definitions* shows how his logic found nourishment at this source. "If you wish to converse with me," said Voltaire, "define your terms." How many a debate would have been deflated into a paragraph if the disputants had dared to define their terms! This is the alpha and omega of logic, the heart and soul of it, that every important term in serious discourse shall be subjected to strictest scrutiny and definition. It is difficult, and ruthlessly tests the mind; but once done it is half of any task.

Yet how shall we proceed to define an object or a term? Aristotle answers that every good definition has two parts, stands on two solid feet: first, it assigns the object in question to a class or group of objects whose general characteristics are also its own—so man is, first of all, an animal; and secondly, it indicates wherein the object differs from all the other members of its class—so man, in the Aristotelian system, is a *rational* animal, his "specific

difference" is that unlike all other animals he is rational (here, you see, is the origin of a pretty legend). Aristotle drops an object into the ocean of its class, then takes it out all dripping with generic meaning, with the marks of its kind and group; while its individuality and difference shine out all the more clearly for this juxtaposition with other objects which resemble it so much and are so different.

Passing out from this rear line of logic we come into the great battlefield on which Aristotle fought out with Plato the dread question of "universals"; it was the first conflict in a war which was to last till our own day, and make all medieval Europe ring with the clash of "realists" and "nominalists."¹³ A universal, to Aristotle, is any common noun, any name capable of universal application to the members of a class: so *animal*, *man*, *book*, *tree*, are universals. But these universals are subjective notions, not tangibly objective realities; they are *nomina* (names), not *res* (things); all that exists outside us is a world of individual and specific objects, not of generic and universal things; men exist, and trees, and animals; but man-in-general, or the universal man, does not exist, except in thought; he is a handy mental abstraction, not an external presence or reality. Now Aristotle understands Plato to have held that great universals have objective existence; and indeed Plato had said that the universal is incomparably more lasting and important and substantial than the individual—the latter being but a little wavelet in a ceaseless surf; *men* come and go, but *man* goes on forever. Aristotle's is a matter-of-fact mind;

¹³It was in reference to this debate that Friedrich Schlegel said, "Every man is born either a Platonist or an Aristotelian" (in Benn, i, 291).

as William James would say, a tough, not a tender, mind; he sees the root of endless mysticism and scholarly nonsense in this Platonic "realism"; and he attacks it with all the vigor of a first polemic. As Brutus loved not Caesar less but Rome more, so Aristotle says, *Amicus Plato, sed magis amica veritas*—"Dear is Plato, but dearer still is truth." A hostile commentator might remark that Aristotle (like Nietzsche) criticizes Plato so keenly because he is conscious of having borrowed from him generously; no man is a hero to his debtors. But Aristotle has a healthy attitude, nevertheless; he is a realist almost in the modern sense; he is resolved to concern himself with the objective presence, while Plato is absorbed in a subjective future; or, to juggle with the words, Aristotle has a present objective, and Plato's subject is the future. There was, in the Socratic-Platonic demand for definitions, a tendency away from things and facts to theories and ideas, from particulars to generalities, from science to scholasticism; at last Plato became so devoted to generalities that they began to determine his particulars, so devoted to ideas that they began to define or select his facts. Aristotle preaches a return to things, to the "unwithered face of nature" and reality; he had a lusty preference for the concrete particular, for the flesh and blood individual. But Plato so loved the general and universal that in the *Republic* he destroyed the individual to make a perfect state.

Yet, as is the usual humor of history, the young warrior takes over many of the qualities of the old master whom he assails. We have always goodly stock in us of that which we condemn: as only similars can be profitably contrasted, so only similar people quarrel, and

the bitterest wars are over the slightest variations of purpose or belief. The knightly Crusaders found in Saladin a gentleman with whom they could quarrel amicably; but when the Christians of Europe broke into hostile camps there was no quarter for even the courtliest foe. Aristotle is so ruthless with Plato because there is so much of Plato in him; he too remains a lover of abstractions and generalities, repeatedly betraying the simple fact for some speciously bedizened theory, and compelled to a continuous struggle to conquer the philosophic passion for exploring the empyrean.

There is a heavy trace of this in the most characteristic and original of Aristotle's contributions to philosophy—the doctrine of the syllogism. A syllogism is a trio of propositions of which the third (the conclusion) follows from the conceded truth of the other two (the "major" and "minor" premises). E. g., man is a rational animal; but Socrates is a man; therefore Socrates is a rational animal. The mathematical reader will see at once that the structure of the syllogism resembles the proposition that two things equal to the same thing are equal to each other; if A is B, and C is A, then C is B. As in the mathematical case the conclusion is reached by canceling from both premises their common term, A; so in our syllogism the conclusion is reached by canceling from both premises their common term "man," and combining what remains. The difficulty, as logicians have pointed out from the days of Pyrrho to those of Stuart Mill, lies in this, that the major premise of the syllogism takes for granted precisely the point to be proved; for if Socrates is not rational (and since no one questions that he is a man) it is not universally true that man is a rational animal. Aristotle would reply, no doubt, that

where an individual is found to have a large number of qualities characteristic of a class ("Socrates is a man"), a strong presumption is established that the individual has the other qualities characteristic of the class ("rationality"). But apparently the syllogism is not a mechanism for the discovery of truth so much as for the clarification of exposition and thought.

All this, then, like the many other items of the *Organon*, has its value: "Aristotle has discovered and formulated every canon of theoretical consistency, and every artifice of dialectical debate, with an industry and acuteness which cannot be too highly extolled; and his labors in this direction have perhaps contributed more than any other single writer to the intellectual stimulation of after ages."¹⁴ But no man ever lived who could lift logic to a lofty strain: a guide to correct reasoning is as elevating as a manual of etiquette; we may use it, but it hardly spurs us to nobility. Not even the bravest philosopher would sing to a book of logic underneath the bough. One always feels towards logic as Virgil bade Dante feel towards those who had been damned because of their colorless neutrality: *Non ragionam di lor, ma guarda e passa*—"Let us think no more about them, but look once and pass on."¹⁵

IV. THE ORGANIZATION OF SCIENCE

1. GREEK SCIENCE BEFORE ARISTOTLE

"Socrates," says Renan,¹⁶ "gave philosophy to mankind, and Aristotle gave it science. There was philosophy before Socrates, and science before Aristotle; and since Socrates and since

¹⁴Benn, i, 307.

¹⁵*Inferno*, iii, 60.

¹⁶*Life of Jesus*, ch. 28

Aristotle, philosophy and science have made immense advances. But all has been built upon the foundation which they laid." Before Aristotle, science was in embryo; with him it was born.

Earlier civilizations than the Greek had made attempts at science; but so far as we can catch their thought through their still obscure cuneiform and hieroglyphic script, their science was indistinguishable from theology. That is to say, these pre-Hellenic peoples explained every obscure operation in Nature by some supernatural agency; everywhere there were gods. Apparently it was the Ionian Greeks who first dared to give natural explanations of cosmic complexities and mysterious events: they sought in physics the natural causes of particular incidents, and in philosophy a natural theory of the whole. Thales (640-550 B. C.), the "Father of Philosophy," was primarily an astronomer, who astonished the natives of Miletus by informing them that the sun and stars (which they were wont to worship as gods) were merely balls of fire. His pupil Anaximander (610-540 B. C.), the first Greek to make astronomic and geographical charts, believed that the universe had begun as an undifferentiated mass, from which all things had arisen by the separation of opposites; that astronomic history periodically repeated itself in the evolution and dissolution of an infinite number of worlds; that the earth was at rest in space by a balance of internal impulsions (like Buridan's ass); that all our planets had once been fluid, but had been evaporated by the sun; that life had first been formed in the sea, but had been driven upon the land by the subsidence of the water; that of these stranded animals some had developed the capacity to breathe air, and had so become the progenitors

of all later land life; that man could not from the beginning have been what he now was, for if man, on his first appearance, had been so helpless at birth, and had required so long an adolescence, as in these later days, he could not possibly have survived. Anaximenes, another Milesian (fl. 450 B. C.), described the primeval condition of things as a very rarefied mass, gradually condensing into wind, cloud, water, earth, and stone; the three forms of matter—gas, liquid and solid—were progressive stages of condensation; heat and cold were merely rarefaction and condensation; earthquakes were due to the solidification of an originally fluid earth; life and soul were one, an animating and expansive force present in everything everywhere. Anaxagoras (500-428 B. C.), teacher of Pericles, seems to have given a correct explanation of solar and lunar eclipses; he discovered the processes of respiration in plants and fishes; and he explained man's intelligence by the power of manipulation that came when the fore-limbs were freed from the tasks of locomotion.

Heraclitus (530-470 B. C.), who left wealth and its cares to live a life of poverty and study in the shade of the temple porticoes at Ephesus, turned science from astronomy to earthlier concerns. All things forever flow and change, he said; even in the stillest matter there is unseen flux and movement. Cosmic history runs in repetitious cycles, each beginning and ending in fire (here is one source of the Stoic and Christian doctrine of last judgment and hell). "Through strife," says Heraclitus, "all things arise and pass away. . . War is the father and king of all: some he has made gods and some men; some slaves, and some free." Where there is no strife there is decay: "the mixture which is not shaken decomposes." In this flux of change and struggle and selection, only one

thing is constant, and that is law. "This order, the same for all things, no one of gods or men has made; but it always was, and is, and shall be."—Empedocles (fl. 445 B. C., in Sicily) developed to a further stage the idea of evolution.¹⁷ Organs arise not by design but by selection. Nature makes many trials and experiments with organisms, combining organs variously; where the combination fails, the organism is weeded out; as time goes on, organisms are more and more intricately and successfully adapted to their surroundings.—Finally, in Leucippus (fl. 445 B. C.) and Democritus (460-360), master and pupil in Thracian Abdera, we get the last stage of pre-Aristotelian science—materialistic, deterministic atomism. "Everything," said Leucippus, "is driven by necessity." "In reality," says Democritus,¹⁸ "there are only atoms and the void." Perception is due to the expulsion of atoms from the object upon the sense organ.¹⁹ There are or have been or will be an infinite number of worlds; at every moment planets are colliding and dying, and new worlds are rising out of chaos by the selective aggregation of atoms of similar size and shape. There is no design; the universe is a machine.

This, in dizzy and superficial summary, is the story of Greek science before Aristotle. Its cruder items can be well forgiven when we consider the narrow circle of experimental and observational equipment within which these pioneers were compelled to work. The stagnation of Greek industry under the incubus of slavery prevented the full development of these magnificent be-

ginnings; and the rapid complication of political life in Athens turned the Sophists and Socrates and Plato away from these physical and biological researches into the vaguer paths of ethical and political theory. It is one of the many glories of Aristotle that he was broad and brave enough to compass and combine these two lines of Greek thought, the physical and the moral; that going back beyond his teacher, he caught again the thread of scientific development in the pre-Socratic Greeks, carried on their work with more resolute detail and more varied observation, and brought together all the accumulated results in a magnificent body of organized science.

2. ARISTOTLE AS A NATURALIST

If we begin here chronologically, with his *Physics*, we shall be disappointed; for we find that this treatise is really a *metaphysics*, an abstruse analysis of matter, motion, space, time, infinity, cause, and other such "ultimate concepts." One of the more lively passages is an attack on Democritus' "void": there can be no void or vacuum in nature, says Aristotle, for in a vacuum all bodies would fall with equal velocity; this being impossible, "the supposed void turns out to have nothing in it"—an instance at once of Aristotle's very occasional humor, his addiction to unproved assumptions, and his tendency to disparage his predecessors in philosophy. It was the habit of our philosopher to preface his works with historical sketches of previous contributions to the subject in hand, and to add to every contribution an annihilating refutation. "Aristotle, after the Ottoman manner," says Bacon, "thought he could not reign secure without putting all his brethren to death."²⁰ But to this fratricidal mania we owe much of our knowledge of pre-Socratic thought.

²⁰*Advancement of Learning*, bk. iii. ch. 4.

For reasons already given, Aristotle's astronomy represents very little advance upon his predecessors. He rejects the view of Pythagoras (six century B. C.) that the sun is the center of our system; he prefers to give that honor to the earth. But the little treatise on meteorology is full of brilliant observations, and even its speculations strike illuminating fire. This is a cyclic world, says our philosopher: the sun forever evaporates the sea, dries up rivers and springs, and transforms at last the boundless ocean into the barest rock; while conversely the uplifted moisture, gathered into clouds, falls and renews the rivers and the seas. Everywhere change goes on, imperceptibly but effectively. Egypt is "the work of the Nile," the product of its deposits through a thousand centuries. Here the sea encroaches upon the land, there the land reaches out timidly into the sea; new continents and new oceans rise, old oceans and old continents disappear, and all the face of the world is changed and rechanged in a great systole and diastole of growth and dissolution. Sometimes these vast effects occur suddenly, and destroy the geological and material bases of civilization and even of life; great catastrophes have periodically denuded the earth and reduced man again to his first beginnings; like Sisyphus, civilization has repeatedly neared its zenith only to fall back into barbarism and begin *da capo* its upward travail. Hence the almost "eternal recurrence," in civilization after civilization, of the same inventions and discoveries, the same "dark ages" of slow economic and cultural accumulation, the same rebirths of learning and science and art. No doubt some popular myths are vague traditions surviving from earlier cultures. So the story of man runs in a dreary circle, because he is not yet master of the earth that holds him.

3. THE FOUNDATION OF BIOLOGY

It is not so with life.

As Aristotle walked wondering through his great zoological garden, he became convinced that the infinite variety of life could be arranged in a continuous series in which each link would be almost indistinguishable from the next. In all respects, whether in structure, or mode of life, or reproduction and rearing, or sensation and feeling, there are minute gradations and progressions from the lowest organisms to the highest.²¹ At the bottom of the scale we can scarcely divide the living from the "dead": "nature makes so gradual a transition from the inanimate to the animate kingdom that the boundary lines which separate them are indistinct and doubtful"; and perhaps a degree of life exists even in the inorganic. Again, many species cannot with certainty be called plants or animals. And as in these lower organisms it is almost impossible at times to assign them to their proper genus and species, so similar are they; so in every order of life the continuity of gradations and differences is as remarkable as the diversity of functions and forms. But in the midst of this bewildering richness of structures certain things stand out convincingly: that life has grown steadily in complexity and in power;²² that intelligence has progressed in correlation with complexity of structure and mobility of form;²³ that there has been an increasing specialization of function, and a continuous centralization of physiological control.²⁴ Slowly life created for

²¹*Hist. Animalium*, viii.

²²*De Anima*, ii, 2.

²³*De Partibus Animalium*, i, 7; ii, 10.

itself a nervous system and a brain; and mind moved resolutely on towards the mastery of its environment.

The remarkable fact here is that with all these gradations and similarities leaping to Aristotle's eyes, he does not come to the theory of evolution. He rejects Empedocles' doctrine that all organs and organisms are a survival of the fittest,²⁵ and Anaxagoras' idea that man became intelligent by using his hands for manipulation rather than for movement; Aristotle thinks, on the contrary, that man so used his hands because he had become intelligent.²⁶ Indeed, Aristotle makes as many mistakes as possible for a man who is founding the science of biology. He thinks, for example, that the male element in reproduction merely stimulates and quickens; it does not occur to him (what we now know from experiments in parthenogenesis) that the essential function of the sperm is not so much to fertilize the ovum as to provide the embryo with the heritable qualities of the male parent, and so permit the offspring to be a vigorous variant, a new admixture of two ancestral lines. As human dissection was not practiced in his time, he is particularly fertile in physiological errors: he knows nothing of muscles, not even of their existence; he does not distinguish arteries from veins; he thinks the brain is an organ for cooling the blood; he believes, forgivably, that man has more sutures in the skull than woman; he believes, less forgivably, that man has only eight ribs on each side; he believes, incredibly and unforgivably, that woman has

²⁴*De Partibus Animalium*, iv, 5-6.

²⁵*De Anima*, ii, 4.

²⁶*De Part. An.*, iv. 10.

fewer teeth than man.²⁷ Apparently Aristotle's relations with women were of the most amicable kind.

Yet he makes a greater total advance in biology than any Greek before or after him. He perceives that birds and reptiles are near allied in structure; that the monkey is in form intermediate between quadrupeds and man; and once he boldly declares that man belongs in one group of animals with the viviparous quadrupeds (our "mammals").²⁸ He remarks that the soul in infancy is scarcely distinguishable from the soul of animals.²⁹ He makes the illuminating observation that diet often determines the mode of life; "for of beasts some are gregarious, and others solitary—they live in the way which is best adapted to . . . obtain the food of their choice."³⁰ He anticipates Von Baer's famous law that characters common to the genus (like eyes and ears) appear in the developing organism before characters peculiar to its species (like the "formula" of the teeth), or to its individual self (like the final color of the eyes);³¹ and he reaches out across two thousand years to anticipate Spencer's generalization that individuation varies inversely as genesis—that is, that the more highly developed and specialized a species or an individual happens to be, the smaller will be the number of its offspring.³² He notices and explains reversion to type—the tendency of a prominent variation (like genius) to be diluted in mating and lost

²⁸*Hist. An.* i, 6; ii, 3.

²⁹*Ibid.*, viii, 1.

³⁰*Politics*, i, 8.

³¹*Hist. An.* i, 6; ii, 8.

³²*De Generatione Animalium*, ii, 12.

in successive generations. He makes many zoological observations which, temporarily rejected by later biologists, have been confirmed by modern research—of fishes that make nests, for example, and a species of shark that boasts of a placenta.

And finally he establishes the science of embryology. "He who sees things grow from their beginning," he writes, "will have the finest view of them." Hippocrates (b. 460 B. C.), greatest of Greek physicians, had given a fine example of the experimental method, by breaking a hen's eggs at various stages of incubation; and had applied the results of these studies in his treatise "On the Origin of the Child." Aristotle followed this lead and performed experiments which enabled him to give a description of the development of the chick which even today arouses the admiration of embryologists.³³ He must have performed some novel experiments in genetics, for he disproves the theory that the sex of the child depends on what testis supplies the reproductive fluid, by quoting a case where the right testis of the father had been tied and yet the children had been of different sexes.³⁴ He raises some very modern problems of heredity. A woman of Elis had married a negro; her children were all whites, but in the next generation negroes reappeared; where, asks Aristotle, was the blackness hidden in the middle generation?³⁵ There was but a step from such a vital and intelligent query to the epochal experiments of Gregor Mendel (1822-1882). *Prudens quaestio dimidium scientiae—*

³³*De Part. An.*, iii, 4.

⁴³Lewes, 112.

³⁵Gomperz, iv, 169.

to know what to ask is already to know half. Surely, despite the errors that mar these biological works, they form the greatest monument ever raised to the science by any one man. When we consider that before Aristotle there had been, so far as we know, no biology beyond scattered observations, we perceive that this achievement alone might have sufficed for one life-time, and would have given immortality. But Aristotle had only begun.

V. METAPHYSICS AND THE NATURE OF GOD

His metaphysics grew out of his biology. Everything in the world is moved by an inner urge to become something greater than it is. Everything is both the *form* or reality which has grown out of something which was its *matter* or raw material; and it may in its turn be the matter out of which still higher forms will grow. So the man is the form of which the child was the matter; the child is the form and its embryo the matter; the embryo the form, the ovum the matter; and so back till we reach in a vague way the conception of matter without form at all. But such a formless matter would be no-thing, for every thing was a form. Matter, in its widest sense, is the possibility of form; and form is the actuality, the finished reality, of matter. Matter obstructs, form constructs. Form is not merely the shape but the shaping force, an inner necessity and impulse which moulds mere material to a specific figure and purpose; it is the realization of a potential capacity of matter; it is the sum of the powers residing in anything to do, to be, or to become. Nature is the conquest of matter

by form, the constant progression and victory of life.³⁶

Everything in the world moves naturally to a specific fulfilment. Of the varied causes which determine an event, the final cause, which determines the purpose, is the most decisive and important. The mistakes and futilities of nature are due to the inertia of matter resisting the forming force of purpose—hence the abortions and the monsters that mar the panorama of life. Development is not haphazard or accidental (else how could we explain the almost universal appearance and transmission of useful organs?); everything is guided in a certain direction from within, by its nature and structure and entelechy;³⁷ the egg of the hen is internally designed or destined to become not a duck but a chick; the acorn becomes not a willow but an oak. This does not mean for Aristotle that there is an external providence designing earthly structures and events; rather the design is internal, and arises from the type and function of the thing. "Divine Providence

³⁶Half of our readers will be pleased, and the other half amused, to learn that among Aristotle's favorite examples of manner and form are woman and man; the male is the active, formative principle; the female is passive clay, waiting to be formed. Female offspring are the result of the failure of form to dominate matter (*De Gen. An.*, i, 2).

³⁷*Entelecheia*—having (*echo*, its purpose (*telos*) within (*entos*); one of those magnificent Aristotelian terms which gather up into themselves a whole philosophy. The informed reader need not be reminded that the "ortho-genic" school of evolutionists finds its first formulation in these passages of Aristotle.

coincides completely for Aristotle with the operation of natural causes."³⁸

Yet there is a God, though not perhaps the simple and human god conceived by the forgivable anthropomorphism of the adolescent mind. Aristotle approaches the problem from the old puzzle about motion—how, he asks, does motion begin? He will not accept the possibility that motion is as beginningless as he conceives matter to be: matter may be eternal, because it is merely the everlasting possibility of future forms; but when and how did that vast process of motion and formation begin which at last filled the wide universe with an infinity of shapes? Surely motion has a source, says Aristotle; and if we are not to plunge drearily into an infinite regress, putting back our problem step by step, endlessly, we must posit a prime mover unmoved (*primum mobile immotum*), a being incorporeal, indivisible, spaceless, sexless, passionless, changeless, perfect and eternal. God does not create, but he moves, the world; and he moves it not as a mechanical force but as the total motive of all operations in the world; "God moves the world as the beloved object moves the lover."³⁹ He is the final cause of nature, the drive and purpose of things, the form of the world; the principle of its life, the sum of its vital processes and powers, the inherent goal of its growth, the energizing entelechy of the whole. He is pure energy;⁴⁰ the Scholastic *Actus Purus*—activity *per se*; perhaps the mystic "Force" of modern physics and philosophy. He is not so much a person as a magnetic power.⁴¹

³⁸*Ethics*, i. 10; Zeller, ii, 329.

³⁹*Metaphysics*, ix, 7.

⁴⁰*Ibid*, xii, 8.

⁴¹Grant, 173.

Yet, with his usual inconsistency, Aristotle represents God as self-conscious spirit. A rather mysterious spirit; for Aristotle's God never does anything; he has no desires, no will, no purpose; he is activity so pure that he never acts. He is absolutely perfect; therefore he cannot desire anything; therefore he does nothing. His only occupation is to contemplate the essence of things; and since he himself is the essence of all things, the form of all forms, his sole employment is the contemplation of himself.⁴² Poor Aristotelian God!—he is a *roi-fainéant*, a do-nothing king; “the king reigns, but he does not rule.” No wonder the British like Aristotle; his God is obviously copied from their king.

Or from Aristotle himself. Our philosopher so loved contemplation that he sacrificed to it his conception of divinity. His God is of the quiet Aristotelian type, nothing romantic, withdrawn to his ivory tower from the strife and stain of things; all the world away from the philosopher-kings of Plato, or from the stern flesh-and-blood reality of Yahveh, or the gentle and solicitous fatherhood of the Christian God.

VI. PSYCHOLOGY AND THE NATURE OF ART

Aristotle's psychology is marred with similar obscurity and vacillation. There are many interesting passages: the power of habit is emphasized, and is for the first time called “second nature”; and the laws of association, though not developed, find here a definite formulation. But both the crucial problems of philosophical psychology—the freedom of the will and the immortality of the soul—are left

⁴²*Meta.* xii, 8; *Ethics*, x, 8.

in haze and doubt. Aristotle talks at times like a determinist—"We cannot directly will to be different from what we are"; but he goes on to argue, against determinism, that we can choose what we shall be, by choosing now the environment that shall mould us; so we are free in the sense that we mould our own characters by our choice of friends, books, occupations, and amusements.⁴³ He does not anticipate the determinist's ready reply that these formative choices are themselves determined by our antecedent character, and this at last by unchosen heredity and early environment. He presses the point that our persistent use of praise and blame presupposes moral responsibility and free will; it does not occur to him that the determinist might reach from the same premises a precisely opposite conclusion—that praise and blame are given that they may be part of the factors determining subsequent action.

Aristotle's theory of the soul begins with an interesting definition. The soul is the entire vital principle of any organism, the sum of its powers and processes. In plants the soul is merely a nutritive and reproductive power; in animals it is also a sensitive and locomotor power; in man it is as well the power of reason and thought.⁴⁴ The soul, as the sum of the powers of the body, cannot exist without it; the two are as form and wax, separable only in thought, but in reality one organic whole; the soul is not put into the body like the quicksilver inserted by Daedalus into the images of Venus to make "stand-ups" of them. A personal and particular soul can exist only in its own

⁴³*Ethics*, iii, 7.

⁴⁴*De Anima* ii.

body. Nevertheless the soul is not material, as Democritus would have it; nor does it all die. Part of the rational power of the human soul is passive: it is bound up with memory, and dies with the body that bore the memory; but the "active reason," the pure power of thought, is independent of memory and is untouched with decay. The active reason is the universal as distinguished from the individual element in man; what survives is not the personality, with its transitory affections and desires, but mind in its most abstract and impersonal form.⁴⁵ In short, Aristotle destroys the soul in order to give it immortality; the immortal soul is "pure thought," undefiled with reality, just as Aristotle's God is pure activity, undefiled with action. Let him who can, be comforted with this theology. One wonders sometimes whether this metaphysical eating of one's cake and keeping it is not Aristotle's subtle way of saving himself from anti-Macedonian hemlock?

In a safer field of psychology he writes more originally and to the point, and almost creates the study of esthetics, the theory of beauty and art. Artistic creation, says Aristotle, springs from the formative impulse and the craving for emotional expression. Essentially the form of art is an imitation of reality; it holds the mirror up to nature.⁴⁶ There is in man a pleasure in imitation, apparently missing in lower animals. Yet the aim of art is to represent not the outward appearance of things, but their inward significance; for this, and not the external mannerism and detail, is their reality. There may be more human verity in the sternly

⁴⁵*De Anima*, ii, 4; i, 4; iii, 5.

⁴⁶*Poetics*, i, 1447.

classic moderation of the *Œdipus Rex* than in all the realistic tears of the *Trojan Women*.

The noblest art appeals to the intellect as well as to the feelings (as a symphony appeals to us not only by its harmonies and sequences but by its structure and development); and this intellectual pleasure is the highest form of joy to which any man can rise. Hence a work of art should aim at form, and above all at unity, which is the backbone of structure and the focus of form. A drama, e.g., should have unity of action: there should be no confusing sub-plots, nor any digressive episodes.⁴⁷ But above all, the function of art is catharsis, purification: emotions accumulated in us under the pressure of social restraints, and liable to sudden issue in unsocial and destructive action, are touched off and sluiced away in the harmless form of theatrical excitement; so tragedy "through pity and fear, effects the proper purgation of these emotions."⁴⁸ Aristotle misses certain features of tragedy (e. g., the conflict of principles and personalities); but in this theory of catharsis he has made a suggestion endlessly fertile in the understanding of the almost mystic power of art. It is an illuminating instance of his ability to enter every field of speculation, and to adorn whatever he touches.

VII. ETHICS AND THE NATURE OF HAPPINESS

And yet, as Aristotle developed, and young men crowded about him to be taught and

⁴⁷Aristotle gives only one sentence to unity of time; and does not mention unity of place; so that the "three unities" commonly foisted upon him are later inventions (Norwood, *Greek Tragedy*, p. 42, note).

⁴⁸*Poetics*, vi, 1449.

formed, more and more his mind turned from the details of science to the larger and vaguer problems of conduct and character. It came to him more clearly that above all questions of the physical world there loomed the question of questions—what is the best life?—what is life's supreme good?—what is virtue?—how shall we find happiness and fulfilment?

He is realistically simple in his ethics. His scientific training keeps him from the preaching of superhuman ideals and empty counsels of perfection. "In Aristotle," says Santayana, "the conception of human nature is perfectly sound; every ideal has a natural basis, and everything natural has an ideal development." Aristotle begins by frankly recognizing that the aim of life is not goodness for its own sake, but happiness. "For we choose happiness for itself, and never with a view to anything further; whereas we choose honor, pleasure, intellect . . . because we believe that through them we shall be made happy."⁴⁹ But he realizes that to call happiness the supreme good is a mere truism; what is wanted is some clearer account of the nature of happiness, and the way to it. He hopes to find this way by asking wherein man differs from other beings; and by presuming that man's happiness will lie in the full functioning of this specifically human quality. Now the peculiar excellence of man is his power of thought; it is by this that he surpasses and rules all other forms of life; and as the growth of this faculty has given him his supremacy, so, we may presume, its development will give him fulfilment and happiness.

The chief condition of happiness, then, barring certain physical pre-requisites, is the life of reason—the specific glory and power of

⁴⁹*Ethics*, i, 7.

man. Virtue, or rather excellence,⁵⁰ will depend on clear judgment, self-control, symmetry of desire, artistry of means; it is not the possession of the simple man, nor the gift of innocent intent, but the achievement of experience in the fully developed man. Yet there is a road to it, a guide to excellence, which may save many detours and delays: it is the middle way, the golden mean. The qualities of character can be arranged in triads, in each of which the first and last qualities will be extremes and vices, and the middle quality a virtue or an excellence. So between cowardice and rashness is courage; between stinginess and extravagance is liberality; between sloth and greed is ambition; between humility and pride is modesty; between secrecy and loquacity, honesty; between moroseness and buffoonery, good humor; between quarrelsomeness and flattery, friendship; between Hamlet's indecisiveness and Quixote's impulsiveness is self-control.⁵¹ "Right," then, in ethics or conduct, is not different from "right" in mathematics or engineering; it means correct, fit, what works best to the best result. The golden mean, however, is not like the mathematical mean, an exact average of two precisely calculable extremes; it fluctuates with the collateral circumstances of each situation, and discovers itself only to ma-

⁵⁰The word *excellence* is probably the fittest translation of the Greek *arete*, usually mistranslated *virtue*. The reader will avoid misunderstanding Plato and Aristotle if, where translators write *virtue*, he will substitute *excellence*, *ability*, or *capacity*. The Greek *arete* is the Roman *virtus*; both imply a masculine sort of excellence (*Ares*, god of war; *vir*, a male). Classical antiquity conceived virtue in terms of man, just as medieval Christianity conceived it in terms of woman.

⁵¹*Ethics*, i, 7.

ture and flexible reason. Excellence is an art won by training and habituation: we do not act rightly because we have virtue or excellence, but we rather have these because we have acted rightly; "these virtues are formed in man by his doing the actions";⁵² we are what we repeatedly do. Excellence, then, is not an act but a habit: "the good of man is a working of the soul in the way of excellence in a complete life: . . . for as it is not one swallow or one fine day that makes a spring, so it is not one day or a short time that makes a man blessed and happy."⁵³

Youth is the age of extremes: "if the young commit a fault it is always on the side of excess and exaggeration." The great difficulty of youth (and of many of youth's elders) is to get out of one extreme without falling into its opposite. For one extreme easily passes into the other, whether through "over-correction" or otherwise: insincerity doth protest too much, and humility hovers on the precipice of conceit.⁵⁴ Those who are consciously at one extreme will give the name of virtue not to the mean but to the opposite extreme. Sometimes this is well; for if we are conscious of erring in one extreme "we should aim at the other, and so we may reach the middle position, . . . as men do in straightening bent timber."⁵⁵ But unconscious extremists look upon the golden mean as the greatest vice; they "expel towards each other the man in the middle position; the brave man is called rash by the coward, and cowardly by the rash man, and in other cases

⁵²*Ethics*, ii, 4.

⁵³*Ibid*, i, 7.

⁵⁴"The vanity of Antisthenes" (the Cynic), said Plato, "peeps out through the holes in his cloak."

⁵⁵*Ethics*, ii, 9.

accordingly";⁵⁶ so in modern politics the "liberal" is called "conservative" and "radical" by the radical and the conservative.

It is obvious that this doctrine of the mean is the formulation of a characteristic attitude which appears in almost every system of Greek philosophy. Plato had had it in mind when he called virtue harmonious action; Socrates when he identified virtue with knowledge. The Seven Wise Men had established the tradition by engraving, on the temple of Apollo at Delphi, the motto *meden agan*,—nothing in excess. Perhaps, as Nietzsche claims,⁵⁷ all these were attempts of the Greeks to check their own violence and impulsiveness of character; more truly, they reflected the Greek feeling that passions are not of themselves vices, but the raw material of both vice and virtue, according as they function in excess and disproportion, or in measure and harmony.⁵⁸

But the golden mean, says our matter-of-fact philosopher, is not all of the secret of happiness. We must have, too, a fair degree of worldly goods: poverty makes one stingy and grasping; while possessions give one that freedom from care and greed which is the source of aristocratic ease and charm. The noblest of these external aids to happiness is friendship. Indeed, friendship is more necessary to the happy than to the unhappy; for happiness is

⁵⁶*Ethics*, ii, 8.

⁵⁷*The Birth of Tragedy*.

⁵⁸Cf. a sociological formulation of the same idea: "Values are never absolute, but only relative. . . . A certain quality it ought to be; therefore we place a value upon it, and . . . encourage and cultivate it. As a result of this valuation we call it a virtue; but if the same quality should become superabundant we should call it a vice and try to repress it."—Carver, *Essays in Social Justice*.

multiplied by being shared. It is more important than justice: for "when men are friends, justice is unnecessary; but when men are just, friendship is still a boon." "A friend is one soul in two bodies." Yet friendship implies few friends rather than many; "he who has many friends has no friend"; and "to be a friend to many people in the way of perfect friendship is impossible." Fine friendship requires duration rather than fitful intensity; and this implies stability of character; it is to altered character that we must attribute the dissolving kaleidoscope of friendship. And friendship requires equality; for gratitude gives it at best a slippery basis. Benefactors are commonly held to have more friendship for the objects of their kindness than these for them.

The account of the matter which satisfies most persons is that the one are debtors and the other creditors, . . . and the debtors wish their creditors out of the way, while the creditors are anxious that their debtors should be preserved. Aristotle rejects this interpretation; he prefers to believe that the greater tenderness of the benefactor is to be explained on the analogy of the artist's affection for his work, or the mother's for her child. We love that which we have made.⁵⁹

And yet, though external goods and relationships are necessary to happiness, its essence remains within us, in rounded knowledge and clarity of soul. Surely sense pleasure is not the way: that road is a circle; as Socrates phrased the coarser Epicurean idea, we scratch that we may itch, and itch that we may scratch. Nor can a political career be the way; for therein we walk subject to the whims of the

⁵⁹*Ethics*, viii and ix.

people; and nothing is so fickle as the crowd. No, happiness must be a pleasure of the mind; and we may trust it only when it comes from the pursuit or the capture of truth. "The operation of the intellect . . . aims at no end beyond itself, and finds in itself the pleasure which stimulates it to further operation; and since the attributes of self-sufficiency, unweariedness, and capacity for rest, . . . plainly belong to this occupation, in it must lie perfect happiness."⁶⁰

Aristotle's ideal man, however, is no mere metaphysician. "He does not expose himself needlessly to danger, since there are few things for which he cares sufficiently; but he is willing, in great crises, to give even his life,—knowing that under certain conditions it is not worth while to live. He is of a disposition to do men service, though he is ashamed to have a service done to him. To confer a kindness is a mark of superiority; to receive one is a mark of subordination . . . He does not take part in public displays . . . He is open in his dislikes and preferences; he talks and acts frankly, because of his contempt for men and things . . . He is never fired with admiration, since there is nothing great in his eyes. He cannot live in complaisance with others, except it be a friend; complaisance is the characteristic of a slave . . . He never feels malice, and always forgets and passes over injuries . . . He is not fond of talking . . . It is no concern of his that he should be praised, or that others should be blamed. He does not speak evil of others, even of his enemies, unless it be to themselves. His carriage is sedate, his voice deep, his speech measured; he is not given to hurry, for he is concerned about only a few things; he is not

⁶⁰*Ethics*, x, 7.

prone to vehemence, for he thinks nothing very important. A shrill voice and hasty steps come to a man through care . . . He bears the accidents of life with dignity and grace, making the best of his circumstances, like a skillful general who marshals his limited forces with all the strategy of war . . . He is his own best friend, and takes delight in privacy whereas the man of no virtue or ability is his own worst enemy, and is afraid of solitude."⁶¹

Such is the Superman of Aristotle.

VIII. POLITICS

1. COMMUNISM AND CONSERVATISM

To so aristocratic an ethic there naturally follows (or was the sequence the other way?) a severely aristocratic political philosophy. It was not to be expected that the tutor of an emperor and the husband of a princess would have any exaggerated attachment to the common people, or even to the mercantile bourgeoisie; our philosophy is where our treasure lies. But further, Aristotle was honestly conservative because of the turmoil and disaster that had come out of Athenian democracy; like a typical scholar he longed for order, security, and peace; this, he felt, was no time for political extravaganzas. Radicalism is a luxury of stability; we may dare to change things only when things lie steady under our hands. And in general, says Aristotle, "the habit of lightly changing the laws is an evil; and when the advantage of change is small, some defects whether in the law or in the ruler had better be met with philosophic toleration. The citizen will gain less by the change than he will lose by acquiring the habit of disobedience."⁶² The

⁶¹*Ethics*, iv, 3.

⁶²*Politics*, ii, 8.

power of the law to secure observance, and therefore to maintain political stability, rests very largely on custom; and "to pass lightly from old laws to new ones is a certain means of weakening the inmost essence of all law whatever."⁶³ "Let us not disregard the experience of ages: surely, in the multitude of years, these things, if they were good, would not have remained unknown."⁶⁴

"These things" of course, means chiefly Plato's communistic republic. Aristotle fights the realism of Plato about universals, and the idealism of Plato about government. He finds many dark spots in the picture painted by the Master. He does not relish the barrack-like continuity of contact to which Plato apparently condemned his guardian philosophers; conservative though he is, Aristotle values individual quality, privacy, and liberty above social efficiency and power. He would not care to call every contemporary brother or sister, nor every elder person father or mother; if all are your brothers, none is; and "how much better it is to be the real cousin of somebody than to be a son after Plato's fashion!"⁶⁵ In a state having women and children in common, "love will be watery. . . . Of the two qualities which chiefly inspire regard and affection—that a thing is your own, and that it awakens real love in you—neither can exist in such a state" as Plato's.⁶⁶

Perhaps there was, in the dim past, a communistic society, when the family was the only state, and pasturage or simple tillage the only form of life. But "in a more divided state of society," where the division of labor into unequally important functions elicits and en-

⁶³*Politics*, v, 8.

⁶⁴*Ibid.*, ii, 5.

⁶⁵*Politics*, ii, 3.

⁶⁶*Ibid.*, ii, 4.

larges the natural inequality of men, communism breaks down because it provides no adequate incentive for the exertion of superior abilities. The stimulus of gain is necessary to arduous work; and the stimulus of ownership is necessary to proper industry, husbandry and care. When everybody owns everything nobody will take care of anything. "That which is common to the greatest number has the least attention bestowed upon it. Everyone thinks chiefly of his own, hardly ever of the public, interest."⁶⁷ And "there is always a difficulty in living together, or having things in common, but especially in having common property. The partnerships of fellow-travelers" (to say nothing of the arduous communism of marriage), "are an example to the point; for they generally fall out by the way, and quarrel about any trifle that turns up."⁶⁸

"Men readily listen" to Utopias, "and are easily induced to believe that in some wonderful manner everybody will become everybody's friend, especially when someone is heard denouncing the evils now existing, . . . which are said to arise out of the possession of private property. These evils, however, arise from quite another source—the wickedness of human nature."⁶⁹ "Political science does not make men, but must take them as they come from nature."⁷⁰

And human nature, the human average, is

⁶⁷*Politics*, II, 3.

⁶⁸*Ibid.*, II, 5.

⁶⁹*Ibid.* Note that conservatives are pessimists, and radicals are optimists, about human nature, which is probably neither so good nor so bad as they would like to believe, and may be not so much nature as early training and environment.

⁷⁰*Ibid.*, I, 10.

nearer to the beast than to the god. The great majority of men are natural dunces and sluggards; in any system whatever these men will sink to the bottom; and to help them with state subsidies is "like pouring water into a leaking cask." Such people must be ruled in politics and directed in industry; with their consent if possible, without it if necessary. "From the hour of their birth some are marked out for subjection, and others for command."⁷¹ "For he who can foresee with his mind is by nature intended to be lord and master; and he who can work only with his body is by nature a slave."⁷² The slave is to the master what the body is to the mind; and as the body should be subject to the mind, so "it is better for all inferiors that they should be under the rule of a master."⁷³ "The slave is a tool with life in it, the tool is a lifeless slave." And then our hard-hearted philosopher, with a glimmer of possibilities which the Industrial Revolution has opened to our hands, writes for a moment with wistful hope: "If every instrument would accomplish its own work, obeying or anticipating the will of others, . . . if the shuttle would weave, or the plectrum touch the lyre, without a hand to guide them, then chief workmen would not need assistants nor masters slaves."⁷⁴

This philosophy typifies the Greek disdain

⁷¹*Politics*, i, 5.

⁷²*Ibid.*, i, 2. Perhaps *slave* is too harsh a rendering of *doulos*; the word was merely a frank recognition of a brutal fact which in our day is perfumed with talk about the dignity of labor and the brotherhood of man; in nothing do we so far surpass the ancients as in making phrases.

⁷³*Ibid.*, i, 5.

⁷⁴*Ibid.*, i, 4.

for manual labor. Such work in Athens had not become so complicated as it is today, when the intelligence demanded in many manual trades is at times much greater than that required for the operations of the lower middle class, and even a college professor may look upon an automobile mechanic (in certain exigencies) as a very god; manual work was then merely manual, and Aristotle looked down upon it, from the heights of philosophy, as belonging to men without minds, as only fit for slaves, and fitting men only for slavery. Manual labor, he believes, dulls and deteriorates the mind, and leaves neither time nor energy for political intelligence; it seems to Aristotle a reasonable corollary that only persons of some leisure should have a voice in government.⁷⁵ "The best form of state will not admit mechanics to citizenship. . . . At Thebes there was a law that no man could hold office who had not retired from business ten years before."⁷⁶ Even merchants and financiers are classed by Aristotle among slaves. "Retail trade is unnatural, . . . and a mode by which men gain from one another. The most hated sort of such exchange is . . . usury, which makes a gain out of money itself, and not from its natural use. For money was intended as an instrument of exchange, and as the mother of interest. This usury (*tokos*), which means the birth of money from money, . . . is of all modes of gain the most unnatural."⁷⁷ Money should not breed. Hence "the discussion of the theory of finance is not unworthy of philosophy; but to be en-

⁷⁵*Politics*, iii, 3; vii, 8.

⁷⁶*Ibid.*, iii, 5.

⁷⁷*Ibid.*, i, 10. This view influenced the medieval prohibition of interest.

gaged in finance, or in money-making, is unworthy of a free man."⁷⁸

2. MARRIAGE AND EDUCATION

"Woman is to man as the slave to the master, the manual to the mental worker, the barbarian to the Greek. Woman is an unfinished man, left standing on a lower step in the scale of development."⁷⁹ The male is by nature superior, and the female inferior; the one rules and the other is ruled; and this principle extends, of necessity, to all mankind." Woman is weak of will, and therefore incapable of independence of character or position; her best condition is a quiet home life in which, while ruled by the man in her external relations, she may be in domestic affairs supreme. Women should not be made more like men, as in Plato's republic; rather the dissimilarity should be increased; nothing is so attractive as the different. "The courage of a man and that of a woman are not, as Socrates supposed, the same: the courage of a man is shown in commanding; that of a woman in obeying. . . . As the poet says, 'Silence is a woman's glory.'"⁸⁰

⁷⁸*Politics*, i, 11. Aristotle adds that philosophers could succeed in such fields if they cared to descend into them; and he proudly points to Thales, who, foreseeing a good harvest, bought up all the reapers in his city, and then, at harvest time, sold them at his own sweet price; whereupon Aristotle observes that the universal secret of great riches is the creation of a monopoly.

⁷⁹*De Gen. Animalium*, ii, 3; *Hist. Animalium*, viii, 1; *Pol.*, i, 5. Cf. Weininger; and Meredith's "Woman will be the last thing civilized by man" (*Ordeal of Richard Feverel*, p. 1). It appears, however, that man was, (or will be) the last thing civilized by woman; for the great civilizing agencies are the family and a settled economic life; and both of these are the creations of woman.

⁸⁰*Politics*, i, 13.

Aristotle seems to suspect that this ideal enslavement of woman is a rare achievement for man, and that as often as not the scepter is with the tongue rather than with the arm. As if to give the male an indispensable advantage, he advises him to defer marriage till the vicinity of thirty-seven, and then to marry a lass of some twenty years. A girl who is rounding the twenties is usually the equal of a man of thirty, but may perhaps be managed by a seasoned warrior of thirty-seven. What attracts Aristotle to this matrimonial mathematics is the consideration that two such disparate persons will lose their reproductive power and passions at approximately the same time. "If the man is still able to beget children while the woman is unable to bear them, or *vice versa*, quarrels and differences will arise. . . . Since the time of generation is commonly limited within the age of seventy years in the man, and fifty in the woman, the commencement of their union should conform to these periods. The union of male and female when too young is bad for the creation of children; in all animals the offspring of the young are small and ill-developed, and generally female." Health is more important than love. Further, "it conduces to temperance not to marry too soon; for women who marry early are apt to be wanton; and in men too the bodily frame is stunted if they marry while they are growing."⁸¹ These matters should not be left to youthful caprice, they should be under state supervision and control: the state should determine the minimum and maximum

⁸¹*Politics*, vii, 16. It is apparent that Aristotle has in mind only the temperance of women; the moral effect of deferred marriage upon men does not seem to agitate him.

ages of marriages for each sex, the best seasons for conception, and the rate of increase in population. If the natural rate of increase is too high, the cruel practice of infanticide may be replaced by abortion; and "let abortion be procured before sense and life have begun."⁸² There is an ideal number of population for every state, varying with its position and resources. "A state when composed of too few is not, as a state should be, self-sufficing; while if it has too many . . . it becomes a nation and not a state, and is almost incapable of constitutional government,"⁸³ or of ethnic or political unity. Probably anything in excess of a population of 10,000 is undesirable.

Education, too, should be in the hands of the state. "That which most contributes to the permanence of constitutions is the adaptation of education to the form of government. . . . The citizen should be moulded to the form of government under which he lives."⁸⁴ By state control of schools we might divert men from industry and trade to agriculture; and we might train men, while keeping property private, to open their possessions to discriminately common use. "Among good men, with respect to the use of property, the proverb will hold, that 'friends should have all things in common.'"⁸⁵ But above all the growing citizen must be taught obedience to law else a state is impossible. "It has been well said that 'he who has never learned to obey cannot be a good commander.' . . . The good citizen should be capable of both." And only a state system of schools can achieve social unity amid ethnic heterogeneity; the state is a plurality which must be made into a unity and a community by

⁸²*Politics.*⁸³*Ibid.*, vii, 4.⁸⁴*Ibid.*, v, 9; viii, 1.⁸⁵*Ibid.*, vi, 4; ii, 5.

education.⁸⁶ Let youth be taught, too, the great boon it has in the state, the unappreciated security which comes of social organization, the freedom that comes of law. "Man, when perfected, is the best of animals; but when isolated he is the worst of all; for injustice is more dangerous when armed, and man is equipped at birth with the weapon of intelligence, and with qualities of character which he may use for the vilest ends. Wherefore if he have not virtue he is the most unholy and savage of animals, full of gluttony and lust." And only social control can give him virtue. Through speech man evolved society; through society, intelligence; through intelligence, order; and through order, civilization. In such an ordered state the individual has a thousand opportunities and avenues of development open to him which a solitary life would never give. "To live alone," then, "one must be either an animal or a god."⁸⁷

Hence revolution is almost always unwise; it may achieve some good, but at the cost of many evils, the chief of which is the disturbance, and perhaps the dissolution, of that social order and structure on which every political good depends. The direct consequences of revolutionary innovations may be calculable and salutary; but the indirect are generally incalculable, and not seldom disastrous. "They who take only a few points into account find it easy to pronounce judgment"; and a man can make up his mind quickly if he has only a little to make up. "Young men are easily deceived, for they are quick to hope." The suppression

⁸⁶*Politics*, iii, 4; ii, 5.

⁸⁷*Ibid.*, i, 2. "Or," adds Nietzsche, who takes nearly all of his political philosophy from Aristotle, "one must be both—that is, a philosopher."

of long-established habits brings the overthrow of innovating government because the old habits persist among the people; characters are not as easily changed as laws. If a constitution is to be permanent, all the parts of a society must desire it to be maintained. Therefore a ruler who would avoid revolution should prevent extremes of poverty and wealth,—“a condition which is most often the result of war”; he should (like the English) encourage colonization as an outlet for a dangerously congested population; and he should foster and practice religion. An autocratic ruler particularly “should appear to be earnest in the worship of the gods; for if men think that a ruler is religious and reveres the gods, they are less afraid of suffering injustice at his hands, and are less disposed to conspire against him, since they believe that the gods themselves are fighting on his side.”⁸⁸

3. DEMOCRACY AND ARISTOCRACY

With such safeguards in religion, in education, and in the ordering of family life, almost any of the traditional forms of government will serve. All forms have good and bad commingled in them, and are severally adapted to various conditions. Theoretically, the ideal form of government would be the centralization of all political power in the one best man. Homer is right: “Bad is the lordship of many; let one be your ruler and master.” For such a man law would be rather an instrument than a limit: “for men of eminent ability there is no law—they are themselves a law. Anyone would be ridiculous who should attempt to make laws for them; they would probably retort what, in the fable of Antisthenes, the lions

⁸⁸*Politics*, iv, 5; ii, 9; v, 7; ii, 11.

said to the hares when, in the council of beasts, the latter began haranguing and claiming equality for all—"Where are your claws?"⁸⁹

But in practice monarchy is usually the worst form of government, for great strength and great virtue are not near allied. Hence the best practicable polity is aristocracy, the rule of the informed and capable few. Government is too complex a thing to have its issues decided by number, when lesser issues are reserved for knowledge and ability. "As the physician ought to be judged by the physician, so ought men in general to be judged by their peers. . . . Now does not this same principle apply to elections? For a right election can only be made by those who have knowledge: a geometrician, e.g., will choose rightly in matters of geometry; or a pilot in matters of navigation. . . ."⁹⁰ So that neither the election of magistrates nor the calling of them to account should be entrusted to the many."

The difficulty with hereditary aristocracy is that it has no permanent economic base; the eternal recurrence of the *nouveaux riches* puts political office sooner or later at the disposal of the highest bidder. "It is surely a bad thing that the greatest offices . . . should be bought. The law which permits this abuse makes wealth of more account than ability, and the whole state becomes avaricious. For whenever the chiefs of the state deem anything honorable, the other citizens are sure to follow their

⁸⁹*Politics*, iii, 13. Aristotle probably had Alexander or Philip in mind while writing this passage, just as Nietzsche seems to have been influenced towards similar conclusions by the alluring career of Napoleon.

⁹⁰*Ibid.*, iii, 11. Cf. the modern argument for "occupational representation."

example" (the "prestige imitation" of modern social psychology); "and where ability has not the first place there is no real aristocracy."⁹¹

Democracy is usually the result of a revolution against plutocracy. "Love of gain in the ruling classes tends constantly to diminish their number" (Marx's "elimination of the middle class"), "and so to strengthen the masses, who in the end set upon their masters and establish democracies." This "rule by the poor" has some advantages. "The people, though individually they may be worse judges than those who have special knowledge, are collectively as good. Moreover, there are some artists whose works are best judged not by themselves alone, but by those who do not possess the art; e.g., the user or master of a house will be a better judge of it than the builder; . . . and the guest will be a better judge of a feast than the cook."⁹² And "the many are more incorruptible than the few; they are like the greater quantity of water which is less easily spoiled than a little. The individual is liable to be overcome by anger, or by some other passion, and then his judgment is necessarily perverted; but it is hardly to be supposed that a great number of persons would all get into a passion and go wrong at the same moment."⁹³

⁹¹*Politics*, ii, 11.

⁹²*Ibid.*, iii, 15, 8, 11. In these passages we have a fair outline of a desirable amendment to democracy; administration by experts democratically chosen by occupational ballot, and pursuing ends determined by the whole community.

⁹³*Ibid.*, iii, 15. Tarde, Le Bon and other social psychologists assert precisely the contrary; and though they exaggerate the vices of the crowd, they might find better support than Aristotle in the behavior of the Athenian Assembly 430-330 B. C.

Yet democracy is on the whole inferior to aristocracy.⁹⁴ For it is based on a false assumption of equality; it "arises out of the notion that those who are equal in one respect (e.g., in respect of the law) are equal in all respects; because men are equally free they claim to be absolutely equal." The upshot is that ability is sacrificed to number, while numbers are manipulated by trickery. Because the people are so easily misled, and so fickle in their views, the ballot should be limited to the intelligent. What we need is a combination of aristocracy and democracy.

Constitutional government offers this happy union. It is not the best conceivable government—that would be an aristocracy of education—but it is the best possible state. "We must ask what is the best constitution for most states, and the best life for most men; neither assuming a standard of excellence which will be above ordinary persons, nor an education exceptionally favored by nature or circumstance, nor yet an ideal state which will be only an inspiration; but having in mind such a life as the majority will be able to share, and a form of government to which states in general can attain." "It is necessary to begin by assuming a principle of general application, namely, that that part of the state which desires the continuance of the government must be stronger than that which does not";⁹⁵ and strength consists neither in number alone, nor in property alone, nor in military or political ability alone, but in a combination of these, so that regard has to be taken of "freedom, wealth, culture and noble birth, as well as of mere numerical superiority." Now where shall we

⁹⁴*Politics*, ii, 9. ⁹⁵*Ibid.*, iv, 11, 10.

find such an *economic* majority to support our constitutional government? Perhaps best in the middle class: here again we have the golden mean, just as constitutional government itself would be a mean between democracy and aristocracy. Our state will be sufficiently democratic if the road to every office is open to all; and sufficiently aristocratic if the offices themselves are closed except to those who have traveled the road and arrived fully prepared. From whatever angle we approach our eternal political problem we monotonously reach the same conclusion: that the community should determine the ends to be pursued, but that only experts should select and apply the means; that choice should be democratically spread, but that office should be rigidly reserved for the equipped and winnowed best.

IX. CRITICISM

What shall we say of this philosophy? Perhaps nothing rapturous. It is difficult to be enthusiastic about Aristotle, because it was difficult for him to be enthusiastic about anything; and *si vis me flere, primum tibi flendum*.⁹⁶ His motto is *nil admirari*—to admire or marvel at nothing; and we hesitate to violate his motto in his case. We miss in him the reforming zeal of Plato, the angry love of humanity which made the great idealist denounce his fellow-men. We miss the daring originality of his teacher, the lofty imagination, the capacity for generous delusion. And yet, after reading Plato, nothing could be so salutary for us as Aristotle's skeptic calm.

Let us summarize our disagreement. We are bothered, at the outset, with his insistence on

⁹⁶ "If you wish me to weep you must weep first"—Horace (*Ars Poetica*) to actors and writers.

logic. We want him to describe his ideal, and he describes a perfect syllogism; not content with that he makes his syllogism judge of our ideals. He thinks the syllogism a description of man's way of reasoning, whereas it merely describes man's way of dressing up his reasoning for the persuasion of another mind; he supposes that thought begins with premises and seeks their conclusions, when actually thought begins with hypothetical conclusions and seeks their justifying premises,—and seeks them best by the observation of particular events under the controlled and isolated conditions of experiment. Yet how foolish we should be to forget that two thousand years have changed merely the incidentals of Aristotle's logic, that Occam and Bacon and Whewell and Mill and a hundred others have but found spots in his sun, and that Aristotle's creation of this new discipline of thought, and his firm establishment of its essential lines, remain among the lasting achievements of the human mind.

It is again the absence of experiment and fruitful hypothesis that leaves Aristotle's natural science a mass of undigested observations. His specialty is the collection and classification of data; in every field he wields his categories and produces catalogues. But side by side with this bent and talent for observation goes a Platonic addiction to metaphysics; this trips him up in every science, and inveigles him into the wildest presuppositions. Here indeed was the great defect of the Greek mind: it was not disciplined; it lacked limiting and steadying traditions; it moved freely in an uncharted field, and ran too readily to theories and conclusions. So Greek philosophy leaped on to heights yet unreached again, while Greek science limped behind. Our modern danger is precisely opposite; inductive data fall upon us

from all sides like the lava of Vesuvius; we suffocate with uncoordinated facts; our minds are overwhelmed with sciences breeding and multiplying into specialistic chaos for want of synthetic thought and a unifying philosophy. We are all mere fragments of what a man might be.

Aristotle's ethics is a branch of his logic: the ideal life is like a proper syllogism. He gives us a handbook of propriety rather than a stimulus to improvement. An ancient critic spoke of him as "moderate to excess." An extremist might call the *Ethics* the champion collection of platitudes in all literature; and an Anglophobe would be consoled with the thought that Englishmen in their youth had done advance penance for the imperialistic sins of their adult years, since both at Cambridge and at Oxford they had been compelled to read every word of the Nicomachean Ethics. One longs to mingle fresh green *Leaves of Grass* with these drier pages, to add Whitman's exhilarating justification of sense joy to Aristotle's exaltation of a purely intellectual happiness. One wonders if this Aristotelian ideal of immoderate moderation has had anything to do with the colorless virtue, the starched perfection, the expressionless good form, of the British aristocracy. Matthew Arnold tells us that in his time Oxford tutors looked upon the *Ethics* as infallible. For three hundred years this book and the *Politics* have formed the ruling British mind, perhaps to great and noble achievements, but certainly to a hard and cold efficiency: one wonders what the result would have been if the masters of the greatest of empires had been nurtured, instead, on the holy fervor and the constructive passion of the *Republic*.

After all, Aristotle was not quite Greek; he had been settled and formed before coming to

Athens; there was nothing Athenian about him, nothing of the hasty and inspiriting experimentalism which made Athens throb with political *élan* and at last helped to subject her to a unifying despot. He realized too completely the Delphic command to avoid excess: he is so anxious to pare away extremes that at last nothing is left. He is so fearful of disorder that he forgets to be fearful of slavery; he is so timid of uncertain change that he prefers a certain changelessness that near resembles death. He lacks that Heraclitean sense of flux which justifies the conservative in believing that all permanent change is gradual, but justifies the radical in believing that no changelessness is permanent. He forgets that Plato's communism was meant only for the élite, the unselfish and ungreedy few; and he comes deviously to a Platonic result when he says that though property should be private its use should be as far as possible common. He does not see (and perhaps he could not be expected in his early day to see) that private control of the means of production was stimulating and salutary only when these means were so simple as to be purchasable by any man; and that their increasing complexity and cost lead to a dangerous centralization of ownership and power, and to an artificial and finally disruptive inequality.

But after all, these are quite inessential criticisms of what remains the most marvelous and influential system of thought ever put together by any single mind. It may be doubted if any other thinker has contributed so much to the enlightenment of the world. Every later age has drawn upon Aristotle, and stood upon his shoulders to see the truth. The varied and magnificent culture of Alexandria found its

scientific inspiration in him. His *Organon* played a central rôle in shaping the minds of the medieval barbarians into disciplined and consistent thought. The other works, translated by Nestorian Christians into Syriac in the fifth century A. D., and thence into Arabic and Hebrew in the tenth century, and thence into Latin towards 1225, turned scholasticism from its eloquent beginnings in Abélard to encyclopedic completion in Thomas Aquinas (1227-1274). The Crusaders brought back more accurate Greek copies of the philosopher's texts; and the Greek scholars of Constantinople brought further Aristotelian treasures with them when, after 1453, they fled from the besieging Turks. The works of Aristotle came to be for European philosophy what the Bible was for theology—an almost infallible text, with solutions for every problem. In 1215 the Papal legate at Paris forbade teachers to lecture on his works; in 1231 Gregory IX appointed a commission to expurgate him; by 1260 he was *de rigueur* in every Christian school, and ecclesiastical assemblies penalized deviations from his views. Chaucer describes his student as happy by having

At his beddes hed
Twenty bookes clothed in blake or red,
Of Aristotle and his philosophie;⁹⁷

and in the first circles of Hell, says Dante,

I saw the Master there of those who know,
Amid the philosophic family,
By all admired, and by all revered;
There Plato too I saw, and Socrates,
Who stood beside him closer than the rest.⁹⁸

Such lines give us some inkling of the honor

⁹⁷Quoted by Benn, i, 276.

⁹⁸*Inferno*, iv, 131f.

which a thousand years offered to the Stagirite. Not till new instruments, accumulated observations, and patient experiments remade science and gave irresistible weapons to Occam and Ramus, to Roger and Francis Bacon, was the reign of Aristotle ended. No other mind had for so long a time ruled the intellect of mankind.

X. LATER LIFE AND DEATH

Meanwhile life had become unmanageably complicated for our philosopher. He found himself on the one hand embroiled with Alexander for protesting against the execution of Calisthenes (a nephew of Aristotle), who had refused to worship Alexander as a god; and Alexander had answered the protest by hinting that it was quite within his omnipotence to put even philosophers to death. At the same time Aristotle was busy defending Alexander among the Athenians. He preferred Greek solidarity to city patriotism, and thought culture and science would flourish better when petty sovereignties and disputes were ended; and he saw in Alexander what Goethe was to see in Napoleon—the philosophic unity of a chaotic and intolerably manifold world. The Athenians, hungering for liberty, growled at Aristotle, and became bitter when Alexander had a statue of the philosopher put up in the heart of the hostile city. In his turmoil we get an impression of Aristotle quite contrary to that left upon us by his *Ethics*: here is a man not cold and inhumanly calm, but a fighter, pursuing his Titanic work in a circle of enemies on every side. The successors of Plato at the Academy, the oratorical school of Isocrates, and the angry crowds that hung on Demosthenes' acid eloquence, intrigued and clamored for his exile or his death.

And then, suddenly (323 B. C.), Alexander died. Athens went wild with patriotic joy; the Macedonian party was overthrown, and Athenian independence was proclaimed. Antipater, successor of Alexander and intimate friend of Aristotle, marched upon the rebellious city. Most of the Macedonian party fled. Eurymedon, a chief priest, brought in an indictment against Aristotle, charging him with having taught that prayer and sacrifice were of no avail. Aristotle saw himself fated to be tried by juries and crowds incomparably more hostile than those that had murdered Socrates. Very wisely, he left the city, saying that he would not give Athens a chance to sin a second time against philosophy. There was no cowardice in this; an accused person at Athens had always the option of preferring exile.⁹⁹ Arrived at Chalcis, Aristotle fell ill; Diogenes Laertius tells us that the old philosopher, in utter disappointment with the turn of all things against him, committed suicide by drinking hemlock.¹⁰⁰ However induced, his illness proved fatal; and a few months after leaving Athens (322 B. C.) the lonely Aristotle died.

In the same year, and at the same age, sixty-two, Demosthenes, greatest of Alexander's enemies, drank poison. Within twelve months Greece had lost her greatest ruler, her greatest orator, and her greatest philosopher. The glory that had been Greece faded now in the dawn of the Roman sun; and the grandeur that was Rome was the pomp of power rather than the light of thought. And then that grandeur too decayed, that little light went almost out. For a thousand years darkness brooded over the face of Europe. All the world awaited the resurrection of philosophy.

THE SINISTER SEX

I

A spiritual dyspepsia was upon Ballard McArthur. Thus his soul was lean and yellow. There are some men who are able, because of a peculiar capacity for illusion, to look upon life and perceive it to be a roaring and fascinating affair. Give them a smile from a long-legged ape of a woman with a pair of shining eyes and they walk about with their chests out, and tap their cigarettes on the backs of their hands before lighting them, and exhibit a gusto incomprehensible to one face to face with the ultimate nothingness of things, incomprehensible to Ballard McArthur.

A curious race, these men. Bustling about their business as if it all meant something or mattered a whoop! Primping and grimacing before women as if there was something, some great and luxurious twist to that! Planning and scheming about these women, fencing, intriguing and giving vent to violent excitements as if there was something unusual and mysterious about the business!

The soul of Ballard McArthur, when it had passed its thirty-fourth year, grew leaner and yellower. He had his philosophy. Indeed, given a vocabulary, he might have put Schopen-

hauer to shame. But although his adjectives were few and dependent chiefly upon the Deity for their punch, his manner was complete, his bearing left nothing in doubt. It was his custom to hold brief and cosmic conversation with Padraic Rafferty, the white-aproned adjutant presiding behind the bar off Runson's Cafe. At five o'clock each afternoon McArthur presented himself for the ministrations of Padraic Rafferty, fortifying himself for his evening's work with two shots of Bourbon and eight minutes of joy-shattering and illusion-smashing converse.

The theme of this daily dialogue was usually no less a matter than Life, with Woman as a sinister side issue. Concerning life, Ballad McArthur held forth in words of arresting finality. Concerning Woman his discourse was ever primitive and unbeautiful. That the ladies were all alike and that all of them were bad was The Ballad's pithy argument. And having delivered himself thereof and wiped his lips, it was his wont to progress with the indifference of a man deaf, dumb and blind through the smear of tables, drinkers, waiters and bus boys that crowded the flamboyant interior of Runson's Cafe at 5:30 each afternoon. Then, seating himself at the piano, he nodded curtly to the violin and clarinet, invariably on the job ahead of him. He threw back his head, his eyes fastend with stoical calm upon the torso of a nymph stenciled with other decorations high on the wall, and then he cut loose.

There was about the nightly performance of

Ballad McArthur at the piano in Runson's Care a precision of touch, an infallibility of tempo which stamped him as a man of accomplishments. And, in fact, in Ballad's repertoire there were no distinctions. A Chopin valse or "The Livery Stable Blues," a thing from Brahms or one of the rollicking cacophonies of his own invention, "Hearts and Flowers," "The Spring Song," "The Boyards' March," the "Humoresque," "The Danse Macabre," the latest hit in rag and the oldest concert knockout, he played them all—a lean and immobile mandarin of the piano. They were, these tunes, part and parcel of the ultimate nothingness of things, the monotonous obligatos to which a world drank beer, nibbled club sandwiches, four-flushed about the labels and the temperatures of wine bottles, and disported itself with a mysterious though pathetic zeal on the dance floor between the tables from 5:30 until 1, when a benevolent municipality released him, Ballad McArthur, from further duties.

Such cynicism as was McArthur's is not achieved casually and in the way one acquires a knowledge of the distance from Zenia, Ohio, to Passadumkeag, Maine. A vast schooling is necessary, a close attention to detail, a constant application to the business in hand. And in achieving his attitude toward life McArthur had not leaped to conclusions. Rather had these conclusions overtaken him. And thus The Ballad's cynicism was not the cynicism of callow and pompous youth—the out-of-tune vibrations of a vacuous vanity! It will only add to the unnecessary detail of this record to

dwell even with caution upon The Ballad's past. Let it be known that he had with painstaking effort tasted of this and of that, loved here and loved there, graduated from the agitations of adolescence, that he had, in short, as the romanticists put it, lived. And that at thirty-four his soul was indeed an encyclopedia of experience, his heart a mausoleum of as many emotions as it is given a man with an undeveloped vocabulary to experience.

And having thus taken the Ballad's unsavory and disillusioning past for granted, and having touched lightly upon the characteristics of the present which somewhat distinguished him above the rank and file of pianobodies, we arrive fresh and open for further information at a rather difficult twist in the dyspeptic evolution of McArthur's lean and yellow soul. He fell in love. By this is not meant that he underwent a birth of raptures and desires, a rejuvenation of jaded corpuscles. To one privy to the intricate idiocies of sex, profoundly grounded in the ultimate nothingness of things, love does not come in the guise dear to the new and old O. Henrys.

It was a night in April when she appeared beside the Ballad's piano, a sheaf of music in her hand and a curious timidity in her eye.

"I'm Dolores," she said, holding forth the music, "and I'm to sing here."

McArthur turned and confronted a young woman dressed with an almost exaggerated modesty, wide-eyed, dark-haired, oval-faced and hesitant. For a moment she stared with a strange intensity at McArthur.

"Mr. McArthur," she faltered; "you are Mr. McArthur? Here . . . is my music."

The Ballad experienced a sudden and inexplicable irritation. Something about the creature speaking to him thus for the first time leaped out and entangled itself in his emotions. He returned her stare, accepted the music from her and slapped it into place on the piano.

"All right," he said and wheeled about on his stool.

Dolores' debut in Runson's Cafe was attended with more than the normal success in such matters. There was about her a charm, a certain quaint anachronism, for she was, or affected to be, timid. She sang in a sweet round voice, such as is sometimes revealed by a maiden performing for company in the parlor of her parents' home. Runson's, while not a rendezvous of evil, was yet accustomed to other things than this manner of Dolores. The mischievous abandon of young women who sang sly songs and kicked up their dresses at the proper intervals, who flashed stockings and adroit lingerie, who winked their eyes and pouted with their lips had invariably been part of the entertainment provided. And so, by the added ruse of neither winking nor pouting, Dolores arrested the attention of her audience.

The success of her debut was repeated night after night, and as is the case among a people secretly addicted to pious thoughts, the girl's modesty and virtue became more than her other talents a topic for conversation among those who ate, drank and danced in Runson's.

Her age was also a matter of beguiling mystery. To men with bald heads she was eighteen. To men more weighted with hair and less with years she was all of twenty-one. To women she was twenty-five if a day. To Ballard McArthur she was an ageless, irritating verification of his cherished theory that all women are born idiots and suffer a rapid decline from the day of their weaning.

For The Ballard had not yet become aware that the emotions Dolores aroused within him were the cramped and distorted heralds of love. Night after night he played her accompaniments, listened with a critically unmoved ear to her round, almost lisping voice, and wondered mildly how she had ever drifted into the business. Concerning the modesty and virtue which had distinguished Dolores from the first, he passed through several cynical attitudes. His keen eyes had noted the absence of jewelry and had been startled once by a glimpse of the most depressing of all sanities, cotton stockings. Nevertheless, he held out.

Things in this unnecessary world are not always what they seem and all that is gilded is not gold—a ripe philosophy, if somewhat withered in spots. And yet McArthur found himself more and more engaging in a sort of dual monologue. There was a part of him which continued cold and unmoved by the evidence. And there was a part of him which took note of the fact that spring had come into the city, that the sun shone vividly upon the great buildings, that cotton stockings after

all argued either an absence of taste or a presence of super-virtue, and that the clarinet and the violin had been rebuked without hysteria for certain cynical overtures.

II

The throes of love's maturing are of interest chiefly to old maids. They have neither the psychology nor the logic which appeals to a thinking, seasoned reader. We pass them by, saluting them with an all-wise smile, and arrive at a night late in May on which certain events important to this record transpired.

It happened, as such things sometimes do when a man's nature is in conflict with itself, that The Ballad was loitering without the Cafe long after the hour appointed for his work. A desire which he refused to admit to himself kept him from quitting the pavement. Dusk had fallen. The lights of the city were beginning to write their yellow script in the air. People were streaming by in endless little syncopating groups. McArthur kept his eye upon them, an eye which waited, aye hungered, for a blue hat with a ribbon about it and a pair of familiar wide dark eyes. The Ballad's innermost and uppermost emotion was guilt—savage, desperate guilt. The flush of shame crept in and out of his cheek, the warmth of indignation vivified his spirit. In vain did he offer soft and delicate vindications to himself.

Walking almost hidden in the crowd, he spied her, and by the leap and the inane convolutions of his thought he knew with the

clarity that comes to men doomed that he, McArthur, was lost.

"I would like," he said as she paused beside him, "to take you home tonight, if you don't mind."

An eager little smile moulded the lips of the woman into a crescent. She did not mind. She would be pleased. And clearing his throat in lieu of further speech, The Ballad watched her go in through the ladies' entrance, as he made his own way toward the belated ministrations of his friend, Padriac Rafferty. The daily dialogue this time, strange as it may appear to the untutored, was more violent and acrimonious than ever. McArthur even outdid himself. Several of the thirsty, sensing diversion, mooched over along the bar and contributed an attentive ear. But even as he talked, cursed and fumed against things as they were and were not, there was in McArthur an unreasoning elation. There was in him the Spring which eternally threatens all men, whatever the condition of their souls. And later, at the piano, McArthur banged out the fandangoes of the dance, ripped through the snorting syncopate with a gusto not easily to be reconciled in a man so profoundly grounded in the ultimate nothingness of things.

As he played this time the music entered The Ballad's mind, and raced from cell to cell after his thought, entangling it, confusing it. And what The Ballad thought, although perhaps immaterial as a contribution toward the progress of the race, will bear setting down. For it was strange thought, all things consid-

ered. It was thought of the Dolores who sang, the Dolores of the photograph rack outside the Cafe, of smiles that might illumine the eyes of Dolores and curve her lips in a manner remarkably fetching. It was thought of the miracle of encountering modesty and charm after so many years of disillusion, of discovering a woman who had escaped the disgusting and natural heritage of her sex—deceit and vanity.

Forgotten, as if made of mist and blown out of existence by a puff, was the cynicism of April. Dead the shrewd, tongue-in-cheek attitude of February. And the memories which might have warned, might have pointed their sapient fingers into the future, were likewise strangely dormant. Here was a woman above all other women, a creature pure and noble, to whom sin was a word and no more, and to whom life was the caress of sweet thoughts and gentle virtue. Somewhat garbled, to be sure, these meditations. But Ballard McArthur played them on the piano, sang them in his heart and smiled them upon the torso of the nymph stenciled high above his head. Thus do the mighty fall, thus the Caesars of cynicism shed their hard-earned laurels.

There is, in the streets of the city after midnight, a loneliness as corrupting as the silence of country lanes. And there is about the moon which kindles its ghost faces in the windows of many buildings a seduction as potent as the silver which ravishes the seashore in the night.

The Ballard's fingers had closed upon the fingers of his companion and without words they walked on and on. And because only of

the physical law that all journeys must end, they at length ceased their walking and took to standing in front of a little wooden house that crouched in the shadows. Here it was that Dolores lived. Here they remained standing and what happened, happened, and what was, was.

"Dolores," whispered McArthur, the erst-while saturnine McArthur, "Dolores, Dolores, I never thought I'd love like this. But you're so different."

But why eavesdrop upon the great and inevitable inanity? There are some scribblers who reveal an almost loathsome morbidity in such matters. With deliberate elation they chatter of caresses and phrases, of vows and activities sacred to the idiocy of the race. We pass on, adverting the eye, sealing the lips. Truly there are some things which no self-respecting realist of records will suffer to come between him and art. And thus we touch with a deft tolerance upon this night and upon subsequent nights, upon these kisses and upon their inevitable repetitions. McArthur was lost. In his ears sang the angels, in his heart the seraphim rioted, in his eyes were ever sunsets and sunrises and the will-o'-the-wisp colors of illusion. At the piano his fingers betrayed their long training and stumbled. His chords leaped forth violent and confused. There was love in his heart.

III.

For a month such things as have been hinted at endured and increased. Alone in the hotel

he had inhabited for five years, Ballard McArthur communed with himself. The wariness which had at first succeeded in tempering his flights of communing was now another part of the past. Over and over he communed concerning his great fortune, his undeserved fortune. And through the cadenzas of his communing ran always the note which sounded most sweetly in his soul. There were exceptions in the theory he had in his misery achieved. There were women like Dolores. There was Dolores.

It was well along in June that McArthur's brain entered the situation. From some limbo emerged the idea of marriage. This was foreign matter for The Ballard to speculate upon. It had the lure of novelty, the fascination of all unknown things. And above all it appealed vigorously because of its simple and practical nature. To think, for McArthur, was to act, and the proposal with its "Yes" marked an epoch in his emotions.

Two days thereafter he was seated in the modest parlor of the modest rooming house in which Dolores lived. He had persuaded the manager at the Cafe to give him a two weeks' respite and Dolores had received a similar vacation. They were, on this evening, discussing the future. Ah, this future! It was a topic to which McArthur of late reverted in thought or speech on the slightest provocation. This future was something otherwise than the past, something as strange as a journey into fairyland.

"Dolores," said McArthur, sitting close and

speaking softly, "what's the use of waiting? Let's hustle the thing up."

Smiling in the darkness that had come into the room—it was early evening—Dolores nodded her head.

"I'm willing, Bal," she answered. "But . . . I've been wanting to tell you something first. I don't want to marry you without telling you this something."

McArthur, as men do with whom the Fates make sport, laughed amiably.

"Very well," said he, "out with your little something and then away to the clergyman's."

For reply Dolores coiled an appealing arm about his neck and drew his head toward her. "Oh, you're going to be so surprised," she murmured. "But I'm afraid. . . ."

"Come, come," said The Ballad, and egged her on with a kiss.

"Well," Dolores began, and into her voice crept a curiously solemn note, "I really don't have to tell you, but I'm going to. It wouldn't be fair. I've always been a good girl . . . since."

"Since!" echoed McArthur.

"Yes, since," said Dolores. She was looking at him intently. "You've spoken so often of my . . . goodness and everything, I think it's only fair. . . ."

And despite the amazing seriousness of the situation, Dolores exploded in a strange little laugh. "Oh, Bal," she gurgled, "you're so funny."

McArthur, whose heart had been indulging in miserable pyrotechnics during this prelude,

seized upon her little laugh and cuddled it, spread it over this thought, listened to it with his soul long after it had ended. For McArthur was trembling. A man cannot have lived for years privy to the ultimate nothingness of things without retaining some shred of shrewdness even under such conditions as these.

"It was when I was a little girl about sixteen, going on seventeen," Dolores went on, her voice still mysteriously elated. "I was a waitress in my dad's hotel in Goshen. I was so young, Bal, and so tired of living in a little town, and I'd never seen anybody real before."

"For God's sake!" McArthur blurted forth. "What are you talking about? Tell me, quick."

His trembling had assumed the proportions of an ague.

Dolores, with a quaint little note of mockery in her voice, a note that utterly escaped the feverish attention of McArthur, went on.

"Don't get the fidgets so, Bal. You make me feel like something in a melodrama. Now listen quietly and don't interrupt, please, dearest. There was a man came to Goshen. He was an actor and he stopped at dad's little hotel. He played the piano in the little vaudeville theater on Main Street. And I waited on him at meal time and we talked. And then one evening, oh, Bal! don't please. Listen to it all and don't be so excited."

"Go on," groaned McArthur. He was sitting stiff and upright in his chair.

"That's better, dearest," Dolores continued. "And then one evening we went walking. He was such a wonderful man. I fell in love with

him. It was the first time I'd been in love. And he said he loved me. I believed him, just as I believed you this time. But I was a kid then—and,—well . . ."

Dolores regarded the silent, immobile figure of her sweetheart, noted the pallor of his face which shone in the dark, and then, with another strange little laugh, leaned toward him and whispered: "Don't you remember?"

The question went unanswered. No word came from Ballard McArthur, no sound.

"Don't you remember, Bal, the little waitress in Goshen, Indiana, nine years ago, that you made love to and . . . left the next day without a word. Oh, Bal, think!"

Ballard McArthur turned his eyes toward the young woman and opened his mouth. "Remember?" he echoed.

"Yes, darling, it was you. O, it was you. That's . . . that's why I told you. I recognized you the first night I came to the cafe. I hadn't seen you since or heard from you. But I knew you."

"Me!" cried McArthur. "You're insane!"

Dolores bit her lip. Tears came out of her eyes. In a voice somewhat broken she rushed on: "Bal, you haven't forgotten? Tell me you haven't. Don't you remember? You sat at the table under the window with the vines around it. And you always ordered grapefruit in the morning."

An inarticulate noise issued from the throat of McArthur. Receiving no reply, Dolores hurriedly continued: "Yes, and you were at the Goshen Opera House and played the piano

there with another man who sang and played the banjo. A short little man, Bal. And you told me you loved me. And I . . . I believed you. . . ."

A silence fell upon the two. McArthur's deep breathing was the only sound in the room. From the distance came the derisive cry of an auto horn. At length McArthur spoke.

"It wasn't me," he said. "It wasn't me. It was somebody else."

"For God's sake," Dolores cried, seizing his arm, "dont! . . . Bal, you're breaking my heart!"

"It was somebody else," groaned Ballard McArthur. "I don't remember. . . ."

"Bal . . . Bal . . . Stop and think. We walked along the road. . . . Oh, Bal . . . You said—you said——"

"It wasn't me," groaned McArthur again.

"And you sang 'Coon, Coon, Coon, I Wish My Color Would Fade.' And the little short man played the banjo. I mean he sang it and you played it on the piano. 'Coon, Coon, Coon. . . .'"

Ballad McArthur's hand went slowly to his eyes. His lips compressed and he drew a long breath.

"Now you remember," went on Dolores. "In Goshen, the little waitress. You called me Forgetmenot. . . . Little Forgetmenot. . . . Now you remember, don't you? . . ."

"I remember," spake the McArthur slowly, "of doing a vaudeville turn, yes, but I don't remember playing in Goshen. Wait a minute."

"The Ivy Hotel," blurted Dolores.

"The Ivy Hotel," repeated McArthur softly.

"Oh, how can you forget?" Dolores went on, her voice becoming tearful. "I never forgot. I waited to hear from you—so long. . . . I was true to you—so long. Until I met you I never looked at another man. I came to Chicago and took music lessons after dad died. And when I saw you at the piano that first night, I knew that God—that God had guided me. . . ."

"Goshen," whispered McArthur, "I—I—recall now. Oh!"

With an abrupt movement he jumped to his feet.

"And you forgot!" murmured Dolores. "You forgot all about it! You forgot the little waitress!"

Into McArthur's brain crept a memory vague and distant as some dim shape upon far waters. It drew closer, struggling out of the mists of time, struggling as if for life. It swept past McArthur's inner eye, a vague, confused thing, out of focus, out of line.

Upon it crowded other memories, memories of girls with yellow hair, other than the hair of Dolores, memories of towns never before remembered, memories of walks through village streets. Which one, which one? A dizziness assailed McArthur. Faces—strange dim faces, —floated back and forth within his thought. Names, garbled and jumbled, leaped into his brain. Ah, now he remembered. But no, that was in Ohio somewhere, after he had split with Chesty Collins. He remembered Chesty. Chesty played the banjo and sang. They had

toured the Middle West on a small vaudeville circuit, he, Ballad, at the piano. Goshen! Good God! What had happened in Goshen nine years ago?

And then slowly into McArthur's thoughts drifted a clear image, a clear recollection. The faces vying for recognition retreated before it. Like wraiths they had come out of the tomb of McArthur's heart to haunt him. Now only one of them remained, the girlish, dark-eyed face of a little waitress . . . nine years ago . . . the Ivy Hotel . . . Yes!

"I remember," whispered the McArthur slowly. "But . . . I didn't think it was you. I—I thought you—you were different."

"Different!" cried Dolores. "What do you mean, dear?"

"I thought—," but Ballad McArthur could not articulate the strange and intricate thought which struggled within him, which darkened something within him.

Dolores, at his side on the parlor couch, was weeping. Her soft little sobs were punctuated with a phrase: "And you forgot!"

McArthur's hand caressed the hair of her lowered head.

"I didn't, I didn't," he repeated over and over. "Only I wasn't thinking of you as being someone who—" the word stuck deep in his throat and fell back into his heart like some barbed thing—"sinned!" The word echoed monotonously in his mind. Bending forward, he kissed Dolores on the lips. It was still early, but an unrest had come into McArthur. He sighed.

"I want to think," he said softly. "I'll call you up in the morning."

Dolores, propelled by a bewildering intuition, leaped to her feet. Her arms circled her distracted lover.

"Oh, Bal," she cried against his coat. "Don't go—like this!"

IV.

The following week in the life of Ballard McArthur was a period during which it was given to the accomplished pianist of Runson's Cafe to perceive the futility of thought, to understand the strange mercurial quality of meditation. For three days he absented himself from the presence of Dolores. He walked the streets by sunlight and by moonlight. Like some strong swimmer battling in a horizonless sea was McArthur in the tumbling and chaotic mass of the thoughts, the queries, the conclusions which assailed him from moment to moment. For these three days he sought truthfully and sincerely to straighten out the curious snarl in which the situation presented itself.

After all, had he been the man? There was a slight chance that Dolores was mistaken. His own memory of the affair was so vague, so tenuous. Yes, he had been the man. He remembered. But this Ballard McArthur of nine years ago! He remembered him, too, a worthless fellow, a low, fanciful debauchee. And it was to such a one that Dolores had given herself! And he had believed her, by the nine Gods he had believed her—otherwise. That was why he had fallen in love with her. Hell and damnation! . . . All women were alike. . . .

It was this last conclusion which took the deepest root. Let us be varied in our metaphors. This last conclusion was the rock upon which the submerged McArthur climbed out of his sea. Hell and damnation . . . all women were alike! To bed with McArthur went this sinister thought. Into the street it followed him. A dark, sullen grimace returned, which Padraic Rafferty, the bartender, recognized and hailed with delight when The Ballad hove into view in the second week of his vacation. It was the old McArthur come to his senses, and Padraic Rafferty, who was a man of perceptions, knew and in his own way understood.

"What'll it be?" said he.

"Bourbon," said McArthur. "Have one, Pat."

And they drank as men drink when they plight a troth. And having drunk, the McArthur wiped his lips and smiled, a lean, sal-low smile. His eyes gleamed into the eyes of his friend.

"Ho," he grinned, "you know what I've always told you? Well, it's true. True as the Gospel ain't. Women are born deceivers. And what's more, there ain't a mother's daughter among them that is any better than the rest."

McArthur gazed defiantly into the yes of Rafferty. "'S true," he said and waited for some insane contradiction.

"I've always agreed with you, Mac," answered Padraic Rafferty, "and I always will on that point."

"That being settled," smiled McArthur, "where's the boss? I think I'll get back into harness. Tonight."

And thus it came about that Ballard McArthur at 5:30 walked through the smear of tables, drinkers, waiters, that crowded the flamboyant interior of Runson's Cafe and seated himself at the piano with a curt nod at the clarinet and the violin. He had determined. There was in his heart a strange ache, the ache of something not quite dead. But at this he smiled. Soon it would drag its tired self into the mausoleum wherein many other such things lay in peace.

"Dolores." He repeated the name as he fumbled with the leaves of a new march. She wouldn't come back. McArthur's brain had long ago closed itself to the finer points of the situation, to certain elastic and almost insufferable thoughts which had kept him awake for six nights. There remained only the thought, "I believed in her. I thought she was good. And . . . she was like the rest. . . ."

So, with the curious smile of a man privy to the ultimate nothingness of things, Ballard McArthur banged forth in precise and infallible tempo a thing of sharps and flats and wailing harmonies whose very title was unknown to him.

HAPPINESS

I.

Having betrayed her husband, broken all her vows, bartered her honor, Mrs. Henry Duncan experienced a bitter and peculiar sense of disappointment. She had expected a change, some flaming metamorphosis of soul. She had looked forward with a certain grim elation to some strange and piquant laceration of conscience, moods of intricate despair, emotions of paradoxical intensities.

She sat now in the modest library of her home, her hands folded listlessly over an open book in her lap. She was the same Mrs. Henry Duncan. She was the same Alice. Four days had passed and no change yet. Mrs. Duncan had been reared upon the theory that the world was divided into two classes, people who sinned and people who did not sin. She was twenty-seven and had been married five years. Mrs. Duncan saluted the twenty-seven years of her past with a puzzled sigh, and closed the book in her lap in order that she might think more clearly.

People who sinned and people who did not sin, people who obeyed the laws of God and people who did not obey them; she had crossed the vast and mysterious gulf which yawns between these two divisions of the race. She had not been swept across it or hurled across it or dragged across it. The crossing had been a curious and deliberate business. For four years

she had associated day after day with Henry Duncan. She did not include the first year of their marriage in her memories. She did not include it because in the light of the four years which followed, this first year became a difficult matter to fix in her thought—more and more difficult.

She had had illusions during this first year. Chief among them had been the illusion that good honest love between good honest husbands and wives endures unto the grave. Curious illusion. Love, considered as a quality which contributes a purpose and charm to life, which heightens the cheek at the sight of another, which keeps one filled with delicious and meaningless dreams, had succumbed in Mrs. Henry Duncan at twenty-three. It had been an unreasonable death. She had awakened one morning and said to herself as she was fixing her hair before her dressing table that she no longer loved her husband. She had paused, a hair pin waiting in her fingers, and stared at herself in the mirror, bewildered.

No longer in love with Henry! What a shocking idea! And yet, come to think of it, she could not remember having been in love with him for at least the last four months. Had she ever been in love? What was love?

Sitting thus before her dressing-table mirror arranging her luxurious hair, Mrs. Duncan's pretty, almost girlish face became clouded then with a curious, emotionless sorrow. The raptures she had imagined that were to endure forever, the inexplicable excitements of the heart, the little thrills that certain thoughts

brought to her—odd that she had not noted their absence before! Henry and she had become perfectly placid married folk. She might, indeed, have continued for years without ever having even thought of the fact if not for—for what?

II

Before Mrs. Duncan had finished her toilette at the dressing-table that morning, she had become quite a philosopher. She had initiated herself into the vast masonic cult to which married women and married men silently and secretly belong. There are certain immortal truths which the members of this esoteric and world-wide sect are pledged to keep hidden from each other's eyes and from the eyes of the uninitiate. These truths are:

1. Marriage is a snare and a delusion.
2. Love is a delusion and a snare.
3. Marital affection, conjugal bliss, and matrimonial happiness are terms carefully fostered, deceptions carefully and cunningly carried on, for the more or less cosmic purpose of keeping the race alive.

Having become privy to these precepts of the inner shrine of domesticity, Mrs. Duncan arose from her dressing-table and went about her business with the same complacent precision which had always characterized her. There had been no change in her attitude toward Henry. Their affairs went on exactly as before. Their separate interests combined in the well-ordered routine of all contented and mildly affluent homes. Duncan presided during the

day as head of a local branch of a large insurance company. Mrs. Duncan spent the day directing her maid, paying calls, shopping, attending to certain regular social necessities, planning small dinner parties, having frocks fitted, reading now and then some novel which fell, by chance, into her way. And in the evenings Henry Duncan and his wife Alice sat in the same room, remained as a rule silent, thinking of the trifles which had come into their lives during the day, exchanging monosyllables, making comments concerning the activities of their friends, activities as open and placid as their own, and, now and then, indulging in argument.

These arguments, which sometimes achieved the dignity of quarrels, were the high points in the lives of Duncan and his wife. Although neither could be said to look forward to them, to seize upon them with a curious greediness, to prolong them needlessly or to start them unwisely, there was yet about these quarrels a certain fascinating quality. They were, however, too artificial to distract for long or disturb more than surfacely the souls of the Duncans.

For the purpose of real and vibrant quarrelling there must be a real and vibrant divergence of opinion, a real and vibrant conflict of ideals or ideas. The Duncans, were, however, cast too much in the same mould to achieve such reality and vibrancy. They had been born both in the town in which they lived, a place of some seventy thousand people, an hour or so from New York. They had both

attended the same church, inhaled the same sermons, built their purity and faith upon the same immortal rocks. They believed as if with one brain in the damnation of people who sinned and, what is more discouraging to domestic excitement than all else, in the unchangeable definitions of those things which constitute sin.

Thus Mrs. Duncan lived the four years, her precise prettiness maturing, her figure acquiring a sophistication not quite matronly. And in the spring of the fourth year Mrs. Duncan experienced the unrest and became for the first time privy to another of the immortal truths emblazoned on the inner shrine of matrimony. This truth was that all married women at least once in their lives tire of their husbands, as do all husbands of their wives, and desire forthwith to be divorced and liberated.

III

It was while attending an afternoon tea at the home of Mrs. George Hyler that Mrs. Duncan walked full upon this latest revelation.

Mrs. Hyler was a woman somewhat older, barely thirty, perhaps; a precise woman, a modest and virtuous wife, an entirely estimable and moral force in life. And yet, it was while gazing upon this woman that the revelation came to Mrs. Duncan. There were other women in the room, eight of them, all drinking tea, all talking—what? Nothing. Merely talking, as they merely lived. Animated husks of women, women without emotions, without dreams. Women who were no longer women but insti-

tutions with rules and by-laws, with defined architectures and regulated hours. Women who were, in short, like herself.

Mrs. Duncan ceased smiling and stared earnestly out of the window of the Hyler home. She saw College Avenue with its old-fashioned red brick pavement, its square, well kept, solid houses on which the vines of many years' growth were beginning to bud. The air was clean and fresh. The sunlight bright and exhilarating. It was spring, a polite, wholesome, unmysterious spring. To the women in the Hyler home it meant polite, wholesome and unmysterious expenditures for hats and clothes, drives into the country while their husbands discoursed behind the steering wheel of new makes or tires.

"These women," Mrs. Duncan thought to herself as she stared earnestly into College Avenue, "are all like myself. They don't hate or love anything or anybody. They are all happily married. I wonder how many of them are thinking what I'm thinking?"

Mrs. Duncan was giving birth to an ego. It was an unfamiliar process and made her head feel light. All women give birth to egos at least once in their lives. The egos die. Mrs. Duncan's ego should have died as she walked from the Hyler home down the cool, vivid, lazy spring street. Instead it continued to live and wax strong on the peculiarly unfamiliar smells which greeted Mrs. Duncan's pretty nose, smells of grass and trees and air, and of the polite perfume which arose in apologetic whiffs from her blue Georgette crepe waist as

she walked. Mrs. Duncan, however, did not yet think of sin.

She arrived at her home curiously distracted. Her husband followed her by some twenty minutes. He was tired, unusually bored, unusually aloof. He kissed her. Mrs. Duncan kissed him. He took a bath. Mrs. Duncan brought him some fresh towels. He arose and shaved. He came in and ate dinner.

He said, "We had a pretty lively day at the office. Six rather big contracts. Not bad, eh?"

Mrs. Duncan said, "No, that's fine."

It was, on the whole, no different an evening, this one, than had been all the other evenings. Mrs. Duncan felt, on the whole, no chagrin over her husband's boredom or his silence. She preferred that he remain so.

Ennui is the most subtle and indefinable of all human poisons. It corrodes the heart, eats out the conscience, devours the soul, and yet manages more often than not to leave its victim entirely unchanged. Its action is as delicate and imperceptible as the action of time. It fades the spirit even as cunningly as age whitens the red of youth. But in some rare instances it breaks through on the surface and its victim, staring at himself as into a mirror, sees for the first time its ravagings as the disfigurements of some long latent disease.

Mrs. Duncan, toying idly with an undarned sock—she had achieved all the domestic virtues—thought to herself that she was bored, bored with life, tired of life, wearied of her own brain. Of a sudden the past four years

presented themselves for her contemplation. Hollow, empty, meaningless years!

There was in Mrs. Duncan, as has been suggested, a mysterious faculty of introspection. She had been educated upon the normal department-store classics which make up the curriculum of the high-schools. She had been taught to obey, to reverence, to pray and to worship, to believe implicitly that certain things were right and their opposites wrong. She had been taught to believe that certain kinds of writing, of statuary, of people, of thoughts and of actions were indecent and conducive of evil.

Now, in her twenty-seventh year she believed what she had been taught to believe. She experienced no radicalizing of ideas, no revolution of standards. She had always been precise and proper, from her feet to her imagination. And now, from the bastille of her manifold virtues she gazed out upon the forbidden land. From the pinnacles of her morality she cast an eye across the gulf which reached to the broad and easy roads of another world—a world in which people suffered and joyed, sinned and were damned. A world, in short, containing a strange and unfamiliar folk whose souls were torn from morning till night with strange and unfamiliar emotions.

IV

It was two weeks after this night that Mrs. Duncan encountered Edgar Kendall Brown. He was a tall man with a shock of curly brown hair and a rugged face. He came to the small city from New York to lecture for four nights at the Metropolitan Theater, which faced Monu-

ment Square, on "The Relation of the Drama to Life."

Mrs. Duncan, and all the women whom Mrs. Duncan knew, subscribed to the entire course of four lectures. They were to be given in the afternoon. Mrs. Duncan attended the first in company with her husband, whose office was several doors away. In the evening she again encountered Edgar Kendall Brown at the home of Mrs. Frank Currety, who had given a "reception" for the distinguished lecturer. Her husband was again at her side.

Returning to her home from the reception, Mrs. Duncan experienced the first torment which had ever come upon her spirit. She entered the house gasping. She could barely believe the thoughts which moved quite calmly enough in her brain. And, believing them, she sought with an automatic superficiality to dismiss them. They remained.

Mrs. Duncan's thoughts may be conjectured, in a general way. She had for two weeks been preparing herself for them. Like some hypochondriac nursing a vague ailment, Mrs. Duncan had nursed and coddled the unrest which had come into her. She had held long talks with herself. She had indulged in wild moments of philosophizing.

She had informed herself over and over again that the people who lived on the other side of the gulf did not live as she. Life to them was different. It was a wild, vivid thing full of unthinkable excitements, tortures, ecstasies.

The thoughts which were now in Mrs. Dun-

can's brain as she moved about preparing for the night, oblivious of her equally oblivious husband, were, however, of a more material and practical nature. Within ten minutes they had ceased to frighten her.

V.

The remainder of Mrs. Duncan's journey across the gulf was merely a problem in simple logic. It ended at five o'clock two afternoons later in the arms of the somewhat astounded Edgar Kendall Brown. Details are unnecessary. Time, place, manner, all these things are to the true connoisseur of psychology extraneous. Mr. Brown showed himself a philosopher and a gentleman. He neither offered to elope nor sought to probe with guileful questioning the past or present of his lady. He permitted himself but one abstract remark.

"You suffer," he said, "from a starved soul."

The minutae of such a relation as sprang up between Mrs. Duncan and Mr. Brown and endured for three days, might be the basis for another and differently purposed paper on psychology than this. On the fourth day Mr. Brown passed on to new worlds, promising fidelity and discretion. Mrs. Duncan returned to her home. Having betrayed her husband and bartered her honor, she sat as has been revealed, with a peculiar and bitter sense of disappointment in her soul, a book closed in her lap and her mind touching agilely upon the inscrutable stuff of life.

She had done this dreadful and not to be

whispered thing in the manner that one stretches and yawns as a relief from ennui. She had expected to become, heaven knows what, but something, something vastly different than she had been—a sinner. Instead she was Mrs. Henry Duncan. If she was a sinner she was as yet unaware of it. Boredom, subtle and complete as ever, was settling again upon her heart, upon her thought, upon her life. In a dim way Mrs. Duncan knew that she had penetrated to another immortal truth which is perhaps emblazoned upon the shrine of Hell. The people who sin are no different than the people who do not sin, because sin is no different than virtue and outside the circuit court virtue is indistinguishable from sin.

The thing was, like the matter of her love and its death, merely another illusion gone. Beauty, passion, ecstasy—mere words which people bandied among themselves, too polite to admit that the Creator had overlooked these things in his creating.

Such was the cynicism which came to Mrs. Duncan. Such things, she told herself, existed only in the irresponsible and impractical fancies of the poets. It would be well if some truth-bringer were to arise and announce the fact. She did not, however, yearn for the role of truth-bringer. She smiled sadly to herself. She had crossed the gulf only to discover there was no gulf or, at least, that the world was just the same on the other side as on the side where she had lived for twenty-seven years. And she had, she told herself wistfully, felt for a number of moments, a curious, wild and

unreasoning affection for Edgar Kendall Brown.

Mrs. Duncan rose from her chair in the modest library of her home and walked sedately into the kitchen. She was supervising the manufacture of a cake for her husband. He had remarked the evening previous that he would like a change of dessert. They had been having canned peaches. Mrs. Duncan entered the kitchen, spoke briefly to the kitchen maid, and then suddenly put her hand to her mouth.

"What if Henry knew?"

The thought flashed unbidden through her brain. She had been careful, circumspect. Mr. Brown was, to boot, a gentleman and a lecturer. But nevertheless what if, through some unforeseen oversight, Henry discovered what had happened? Curious thought! Wild conjecture! A shot of pain transfixed Mrs. Duncan for an instant and left her white and smiling.

"Henry must never know."

Henry must never know! It would kill him. He might kill her. It would ruin their lives. There was no doubt of this. She must, at all costs, be careful, cautious, cunning.

Mrs. Duncan had not given this a thought before, this matter of being careful and cunning. Now, however, she gave it a number of thoughts. She grew excited thinking about it. She started humming a song as she moved about, her brain already busy with odd plans.

He must never suspect. She would have to

divert him, to keep his mind from ever dwelling upon such a possibility.

Mrs. Duncan, flushed and strangely elated, returned to her modest library. Here she could think more clearly.

The boredom, the ennui which had returned to her less than a half hour ago, had vanished. There was, in her eyes, a light—a gleam, in fact. Swiftly Mrs. Duncan went over sundry methods of deception. By some process of psychology which will not be here elaborated, Mrs. Duncan, as she meditated, gradually envisaged Henry Duncan, her husband, as a creature of subtle penetrations, as a reader of complex thoughts. He became in her mind endowed with super-cunning powers of super-cunning psychology. He became one who would fasten upon the merest slip, the merest cough or blush as a signal of guilt.

In short, Henry Duncan became a man worthy of his wife's most tempered metal.

He arrived a half hour earlier than was his wont.

Mrs. Duncan paled as he entered the room. She paled still more when he switched on the light and gazed at her.

"You're . . . you're home so early. What's the matter?" she inquired.

She was conscious of a peculiar and intricate elation, the elation of fear, suspense, doubt.

"Nothing," said Duncan curtly.

Yes, he did speak curtly. There was no mistaking that.

He regarded her closely.

"You look flushed," he added. "Sick?"

Mrs. Duncan arose to her feet. A dizzy sensation passed over her. She approached her husband slowly. Her arms went around his neck. She spoke in a low tone.

"Oh, Henry, I do feel rather ill."

She kissed him. Duncan patted her shoulder perfunctorily.

"You'll be all right," he said. "Why, what's the matter? You're crying."

"Oh, nothing," answered Mrs. Duncan, "nothing at all. Kiss me, Henry, please."

He obeyed, wondering somewhat and smiling vaguely.

It was not for several days that Henry Duncan began to remark the change which had come over his wife. She was, come to look at her, almost a different woman. He remembered with odd starts of emotion the girl he had married. She had been something like this, quick, eager, moody, laughing, full of kisses and caresses. Henry Duncan ceased to marvel and accepted his good fortune. He came home one evening, it was almost summer, with a flower in his lapel. Upon another occasion he produced a box of candy.

"Women are strange," he said to an intimate. "You can't understand them. All I've got to say is that after five years of it, I find myself more happily married than ever. But it's all in getting a decent, faithful, and unselfish woman. I suppose."

VI.

Mrs. Henry Duncan sits in the modest library of her home, between five or six each afternoon waiting for her husband. She seems younger than she seemed in the Spring. Her eyes are quick and lighted. Her friends, Mrs. Hyler and Mrs. Currey among others, have complimented her frequently upon her curious change.

"You get so much out of life," says the somewhat envious Mrs. Hyler.

"And you really are getting younger every day," chimes in the totally envious Mrs. Currey.

Little they know, thinks Mrs. Duncan, as she sits in the modest library of her home. Henry will be home soon. A shiver glides down Mrs. Duncan's spine and circles into her heart. Her cheeks pale. A peculiar and complicated emotion seizes her. Her eyes grow moist. She murmurs.

"Henry, poor Henry. He must never know I must be careful. I must watch out."

Henry comes in. He has another flower in his coat lapel. It is summer. Mrs. Duncan rises and approaches him with a slow, cat-like tread. She bends her head to a side and gazes coquettishly at her husband. She laughs in her throat and extends her arms with an abrupt and graceful gesture. . . .

"Henry," she exclaims, "you haven't kissed me yet. . . ."

FIFTEEN MINUTES

Before he was married, Thompson was in a state of mental and physical inertia that had earned him the reputation of a young man of excellent habits and unusual virtues. Where other youths of his acquaintance squandered their little earnings in sad little debauches and shifted restlessly from one pusillanimous job to another, sometimes even packing their goods and turning their faces to new horizons, Thompson buried himself in the hole of his own digging, gravitated placidly in the rut of his own making, and serenely regarded the world outside his ken with the intolerant smile of a superior nature.

His prejudice against drink, his frequent dissertations concerning the evil of cabarets, the mysterious dangers surrounding the modern dances, and the lamentably vulgar trend of the generation in general, convinced the veteran prune-eaters of Mrs. Severin's boarding-house that he was a man of ideals.

Women of the better sort took to him instinctively, recognizing in him a fine, chivalrous conception of their sex. This conception inspired him to remove his hat in department store elevators, to inquire solicitously of Mrs. Severin every evening of the nine years if she would mind if he smoked, and to pat little children on the head and ask of them with engaging earnestness how old they were. Further, it caused him to look askance—if not

sometimes with actual horror—upon the growth of immodesty that was worse among, as he termed them, “the rouged and misguided home-wreckers who have forgotten the beauties of the fireside.” He did not, he affirmed, believe in men allowing their women to share their vices.

Many other illuminating comments could be made on the character of Thompson before his marriage. Suffice to recount that his physical laziness and his utter vacuity established him during these nine years as a splendidly steady, high-minded young man. And also he was always in demand by the two school-teachers, the bald-headed photographer, the very stout widow and such other finer elements as formed the élite of Mrs. Severin’s table, for all their elaborately organized expeditions to the movies and the theater and their Sunday excursions to the heart of nature when, with the aid of opera-glasses, they delighted themselves discovering wonderful birds in the wilds littered with crackerjack boxes and abandoned picnic plates.

At twenty-eight Thompson married a woman whom even his closest friends agreed was his equal. That is, it was conceded by them that the woman Thompson had selected to marry was a creature worthy of the noble standards he had held always of the sex. She had appeared at Mrs. Severin’s table, shy, well mannered, modestly dressed and with a keen appreciation of her new neighbors’ worthiness. After the second week she had asked timidly to be permitted to remain in the parlor following

dinner until the rain ceased outside. Inasmuch as it was the night usually set aside for readings from the poets by Mr. Thompson, the favor was only dubiously granted. But there was none to regret the young woman's presence. She revealed, in fact, as fine and keen an appreciation of literature as could be expected of one denied the advantages of the many evenings which had preceded her. As it was, she sat silent during the debate led by the two school-teachers, but thrilling perceptibly to Thompson's sonorous recitations from Longfellow and Whittier.

II.

Ten months after this event Thompson and the young woman, whose name happened to be Elsie, were married. The courtship must be left to the imagination of such readers as fancy themselves possessed of a sophisticated humor. The exemplary elations of the bridal pair must likewise be denied precious white paper. If it were not for the fact that six years after his marriage Thompson sat in the "library" of his home, an odd frown on his face, a desperate perplexity in his thought, the whole matter of the Thompsons might indeed be intelligently dropped. But in the lives of Thompson and his wife there are fifteen minutes worthy of the hurried historian. What followed these fifteen minutes and what preceded them are things too holy for recording by any other than the angel of heaven or perhaps the author of "Pollyana."

So—at a quarter of eight on an evening in May six years after his marriage—Thompson

sat, as chronicled, frowning oddly and perplexed. Elsie was still in the kitchen tidying up. When she finished she would come in and turn on the light. In the meantime he would sit in the dark. It somehow suited his mood.

Thompson with a mood! To select the fifteen minutes of a man's life when he steps out of character—when he does, says or thinks things which he never has done, said or thought before, and never will again! To limit the saint when he exchanges his halo for the bladder and the slapstick, to spotlight the villain in his single act of charity! By such ruses may truth for a moment be surprised—a hussy caught in negligée.

How it happened that Thompson arrived at such a condition is one of the phenomena of life concerning which your puppeteer must for the present at least keep gravely silent. But there it was—the mood, the peculiar twilight of emotion, the wandering barb of retrospection, crawling bewilderedly through the virgin caverns of his heart and mind. The thing had started earlier in the day and he had gone about his business as clerk in the commission house fronting the river with a sense of detachment from things about him. He had come home and eaten his dinner in silence. And he sat now contemplating, as one might contemplate the rather sudden appearance of a third arm on one's person, the perplexing fact that his life was empty.

Like a machine long junked and rusted, Thompson's brain had of its own volition stirred itself into action. Thoughts were creaking out

of it. As a man of ideals, Thompson had naturally never found it necessary to think, or perhaps even advisable. There were certain ideas—ideas of right and wrong, for instance—which he had long ago fitted into his head. There were certain highly proper, noble theories which he had carefully inserted whole into his gray matter. And presto!—the business of life had been solved. In emergencies, moral or conversational or ethical, recourse to this catalogued mental stock pointed the way, solved the difficulty. Thus by reaching to the shelf for an adage, a commandment, a properly tagged and price-marked code—in short, by accepting grimly, idealistically, what he knew—Thompson had through his life found no impulse to disorder the fine, accurate balance of his ideas with any thinking.

For instance—and the digression establishes a bit firmer the background for these fifteen minutes with which the present history most concerns itself—after his marriage Thompson had taken a lofty inventory of this stock of his. A woman's place was in the home and a man's duty was to love, honor and obey his wife. These were mental commodities of imposing bulk in his warehouse. Accordingly Mrs. Thompson had remained in her home and he to the best extent of his abilities had loved, honored and obeyed her. A man's home was his first and deepest concern, his wife his first and chiefest interest.

Upon these premises the Thompsons had lived and thrived, doing solemnly only those things which befitted respectable folk, exchanging with

solemnity only such fancies as did not violate the ideal of Puritania. And as a result—to the scurrilous there is nothing quite so hideous as the success of virtue—life for the Thompsons had been a business approaching nobility of spirit. They had consorted with the amiable yet high-minded tolerance of persons honestly intent upon living in the light of their finest perceptions. They had moved in a continual Sabbath.

To find life empty after such painstaking piety! With the thought, the chill of an emotion approaching terror coursed through Thompson as he sat in the dark. He struggled to recover the balance of ideas, the innocuous complacency of former meditations. But the thing persisted, flaunting itself as from some external source when he had hurled it from his conscious thought. Empty and desolate. Living in a humdrum of trifles. Imprisoned by four walls bearing the name Home. With a world unknown tumbling about outside his cell.

Like a man surrendering himself to an undertow encountered in a placid stretch of sea, Thompson went down, down into the depths of his mood. Hallucinations beset him. Visions of horrible outline crossed his eye. And what were these things that Thompson saw? They were nothing other than he had seen all his life. It is the familiar which becomes most monstrous, most absurd, when beheld in an unfamiliar light. It is the norm which is the true gargoyle to the eye turned inward.

And the light in which Thompson now be-

held the familiar outlines of his life was the wholly strange tint of his mood. He had lived the six years not only content, but with the elation which comes to a man who accomplishes firmly an appointed task. He had never strayed in thought beyond the accepted confines of what were in his mind labeled virtue and righteousness, duty and decency. And now there had come upon him a nostalgia for lands never visited.

The emotion, though intense, was vague. It did not name precisely for him things that were desirable—the sway and lilt of women, the shouts of laughter of men drinking, the fancy-free adventure over the seas of the earth—yet these generally he desired, visioning them as a man blind might vision objects about him and their colors.

The vagueness of his desires, the uncentered spur of his restlessness, was equalled by a specific detail, which on the other hand complicated his mood with a disgust approaching nausea. This detail concerned itself with the familiar—with the appearance, the thoughts, the doings of his wife, with the odors of his home, with the paraphernalia of his own day. He saw them as things monotonous, felt them like a seething about his lungs. The careful unselfishness toward Elsie, the observation of a thousand intricate trifles of conduct, the coming home each evening to the same walls, the same face, and—worst idiocy of all—to the identical words, gestures, grimaces of the day before. Other men did things. Just what Thompson was unable to declare for himself.

Other men went to stag parties, for instance. They did something anyway, something wonderfully and violently different than he did.

A part of Thompson remained observant and terrified as he sank deeper. It was as if he had divided himself into the two classical complements of being. One of these remained wringing its hands at the spectacle of the other—a teetotaler Siamese watching its umbilical twin engaged in terrific debauch.

As he journeyed into the depths of his mood the detail that had nauseated him gave place abruptly to the vagueness of his unrest. And Thompson the complacent, the idealist, the immaculate husband, thirsted for things which may discretely be labelled adventure. It was a thirst which had never come upon him in his pre-marital days. But, like a belated spring-time, it burst suddenly to bloom. He grew dizzy and shut his eyes. And visions crowded upon him. The word sex included everything but his wife. The thought of love and beauty evolved images of women with roses in their teeth and black shawls slung across red-satin shoulders.

So much for the Thompson who went plunging head first toward the bottom of his mood. The other Thompson, the terrified creature who remained on the brink wringing his hands, is perhaps of more psychological, if elusive, importance. This was the real, or to strain at the Darwinian proprieties, the unreal, Thompson—this the fellow loaded with chunks of ideas and bulging with carefully labelled ethics. And during these moments—fifteen of

them—he perceived himself in various astounding lights. The things he had hoarded with miserly zeal he saw now being plucked from their shelves and tumbled upon the air. He saw himself sinning. And yet he knew it could not be sin, if he was accomplishing it.

Was there something wrong with him? Why didn't Elsie hurry in from the kitchen? No, he would get up and follow himself, as it were, into the night. Walk, walk. Go somewhere. Do something. This living between four walls! This carrying the four walls about with him! This not daring to live as men lived. And how was it men lived? Any way but his way. With their brains somehow different. With different ideas and faces. Anything but the insufferable emptiness of a life based upon doing things always the same and always without meaning. That was it—meaning. Other men had meaning in their lives. He had none. He would break away.

And here for the moment both Thompsons united again, both stood overlooking with awed and enchanted eyes a promised land. A land in which there were no Elsies, no Thompsons.

A pain passed through Thompson's head as he stared at the dark of the room. He lifted his hand and caressed his brow.

III.

It was the maid's day off. Mrs. Thompson hung the frying pan on its appointed hook, smoothed out her apron and raised her hand

toward the chain of the electric light. As she did so a distressing pain shot through her. She paused, her hand in mid-air, her pleasant face contorted mildly. Dropping her arm to her side she increased this contortion into a frown. With eyes a bit too earnest for observing, she searched the ordered walls of her kitchen with its rows of utensils hung from the mid-wall moulding, its white enameled sink, its business-like tables and its innumerable cloths.

Of late Mrs. Thompson had found this part of her day the most difficult. Perhaps it was that the day tired her. But why? She did nothing. She fastened a particularly earnest stare at the frying pan. Nothing but prepare the dinner for Harold, tidy the house, shop, visit a half hour with some wholly uninteresting creature who, like herself, did nothing, and, therefore, had never anything to say.

Mrs. Thompson thought of Harold awaiting her in the "library." A warmth came into her thought immediately. But also another distressing attack of the pain occurred. The warmth vanished, Harold did nothing. It seemed to her that after all people never did anything at all in the world. But what a shameless thing to have such an idea. Mrs. Thompson frowned at herself. Wasn't she the happiest married woman in the world? And wasn't Harold dear and sweet and good? Yet there was no evading the fact that they never did anything but just sit and look at each other. While other people did things. On their way to Billy Sunday's revival, for instance, they

had passed thousands of people who were hurrying to places to do things.

Mrs. Thompson still remained under the lighted electric globe. In a moment she would go in and join Harold. She sighed. She felt restless. Her eyes turned from the wall toward the window and she observed the night. For several moments she stood thinking nothing, but feeling an inexplicable sadness. Then she said to herself:

"I've eaten something that doesn't agree with me. Oh, what an awful pain. It must have been that canned salmon. I wonder if Harold has felt it?"

She became at once concerned. Reaching up this time, she turned out the light without further hesitation and walked toward the "library." She was startled as she approached it to see it in darkness. Where was Harold?

A curious sense of fear possessed her. Something had happened to him! She caught her breath and walked swiftly into the room. A moment later she stood on the threshold staring at her husband. He was sitting in his large chair, his hand passing haltingly over his forehead, and blinking at the sudden light.

She smiled with relief. What an odd fear that was that had come over her in the hall.

"Do you feel ill, Harold?" she asked. "I've had the worst pains in my tummy just now. It must have been that canned salmon."

Thompson stared at her, his eyes still blinking. A grimace slowly wrinkled his face.

"Yes, I have them, too," he answered, covering his waistcoat with his hands. "I've been

having them for the last fifteen minutes. It must have been that salmon. I thought it tasted odd."

"It was," announced Mrs. Thompson with conviction. "You can never trust canned salmon. I only hope it's nothing serious."

Thompson groaned suddenly in his chair.

"Oh, dear," his wife exclaimed, "Isn't it dreadful? I'll go get the pills."

A light broke over Thompson's face. He raised his eyes and, with a smiling tenderness, watched his wife turn and walk toward the bathroom,

THE MAN HUNT

They were hunting him. Squads of coppers with rifles, detectives, stool pigeons were hunting him. And the people who had read the story in the newspapers and looked at his picture, they too, were hunting him.

Tommy O'Connor looked out of the smeared window of the room in which he sat and stared at the snow. A drift of snow across the roofs. A scribble of snow over the pavement.

There were automobiles racing through the streets loaded with armed men. There were crowds looking for a telltale face in their own midst. Guards, deputies, coppers were surrounding houses and peering into alleys, raiding saloons, ringing doorbells. The whole city was on his heels. The city was like a pack of dogs sniffing wildly for his trail. And when they found it they would come whooping toward him for a leap at his throat.

Well, here he was—waiting. It was snowing outside. There was no noise in the street. A man was passing. One of the pack? No. Just a man. The man looked up. Tommy O'Connor took his face slowly away from the window. He had a gun in his pocket and his hand was holding it. But the man was walking away. Huh! If that guy knew that Lucky Tommy O'Connor was watching him from a window he'd walk a little faster. If the guy knew that Lucky O'Connor, who had busted his way out of jail and was being hunted by a million people with

guns, was sitting up here behind the window, he'd throw a fit. But he didn't know. He was like the walls and the windows and the snow outside—quiet and peaceful.

"Nice boy," grinned Tommy O'Connor. Then he began to fidget. He ought to go out and buy a paper. See what was doing. See what became of Mac and the rest of the boys. Maybe they'd all been nabbed. But they couldn't do him harm. On account nobody knew where he was. No pal. No dame. Nobody knew he was sitting here in the room looking at the snow and just thinking. The papers were probably full of cock-and-bull stories about his racing across the country and hiding in haystacks and behind barns. Kid stuff. Maybe he should ought to of left town. But it felt better in town. Some rube was always sure to pick out a stranger beating it down a empty road. And there was no place to hide. Long, empty stretches, where anybody could see you for a mile.

Better in town. Lots of walls, alleys, roofs. Lots of things like that. No hare-and-hounds effect like in the country. But the papers were probably full of a lot of bunk. He'd take a walk later and buy a few. Better sit still now. There was nothing harder to find than a man sitting still.

Tommy O'Connor yawned. Not much sleep the night before. Well, he'd sleep tonight. Worrying wasn't going to help matters. What if they did come? Let them come. Fill up the street and begin their damn shooting. They didn't

think Lucky Tommy was sucker enough to let them march him up on a scaffold and break his neck on the end of a rope. Fat chance. Not him. That sort of stuff happened to other guys, not to Lucky Tommy.

Snowing outside. And quiet. Everybody at work. Funny about that. Tommy O'Connor was the only free man in the city. There was nobody felt like him right now—nobody. Where would he be exactly this time a week from now? If he could only look ahead and see himself at four o'clock next Monday afternoon. But he was free now. No breaking his neck on the end of a rope. If worst came to worst—if worst came to worst—O'Connor's fingers took a grip on the gun in his pocket. They were hunting him. Up and down the streets everywhere. Pacing around in taxis, with rifles sticking out of the windows. Well, why didn't they come into this street? All they had to do was figure out: Here's the street Tommy O'Connor is hiding in. And that looks like the house. And then somebody would yell out: "There he is! Behind that window! That's him!" Why didn't this happen?

Christmas, maybe, he'd call on the folks. No. Rube stuff. A million coppers would be watching the house. But he might drop them a letter. Too bad he didn't have any paper, or he might write a lot of letters. To the chief of police and all the head hunters. Some more rube stuff, that. They could tell by the postmark what part of the city he was hiding in and they'd be on him with a whoop.

Funny how he had landed in this room. No plans, no place in particular to head for. That was the best way. Like he'd figured it out and it turned out perfect. Grab the first auto and ride like hell and keep on changing autos and riding around and around in the streets and crawling deeper into the city until the trail was all twisted and he was buried. But he ought to shave his mustache off. Hell. What for? If they came whooping into the street they'd find him, mustache or no mustache. But what if he wanted to buy some papers?

It was getting darker now. The snow was letting up. Just dribbling. Better if it would snow a lot. Then he could sit and have something to watch—snow falling on the street and turning things white. That was on account of his headache he was thinking that way. Eats might help, but he wasn't hungry. Scared? No. Just waiting. Hunters winding in and out like the snow that was falling. People were funny. They got a big thrill out of hunting a live man who was free in the streets.

He'd be walking some day. Strolling around the streets free as any of them. Maybe not in town. Some other town. Take a walk down State Street. Drop in at a movie. Kid stuff. Walk over to Mac's saloon and kind of casually say "Hello, fellows." And walk out again. God, they'd never hang him. If the worst came to the worst—if the worst came to the worst—but they'd never hang him.

Dark now. But the guys hunting him weren't going to sleep. Lights were going on in the

windows. Better light up the room. People might notice a dark window. But a lighted one would look all right. It was not snowing any more. Just cold.

Well, he'd go out in a while. Stretch his legs and buy the papers and give them a reading. And then take a walk. Just walk around and take in the streets and see if there was anybody he knew. No. Rube stuff, that. Better stick where he was.

Lucky Tommy walked around in the room. The drawn window blind held his eye. Wagons were passing. What for? Yes, and there was a noise. Like people coming. Turn out the light, then. He's take a look.

Tommy O'Connor peeled back the blind carefully. Dark. Lights in windows. Some guys on the corner. Hunting him? Sure. And they were coming his way. Straight down the street. They were looking up. What for? A gun crept out of Tommy O'Connor's pocket. He pressed himself carefully against the wall. He waited. The minutes grew long. But this was the hunt closing in. They were coming. Black figures of men floating casually down the street. All right—let them come.

Lucky Tommy O'Connor's eyes stared rigidly out of the smeared window at a vague flurry of figures that seemed to be coming, coming his way.

GRASS FIGURES

You will sometimes notice when you sit on the back porch after dinner that there are other back porches with people on them. And when you sit on the front steps, that there are other front steps similarly occupied. In the park when you lie down on the grass you will see there are others lying on the grass. And when you look out of your window you can observe other people looking out of their windows.

In the streets when you walk casually and have time to look around you will see others walking casually and looking around, too. And in the theater or church or where you work there are always the inevitable others, always reflecting yourself. You might get to thinking about this as the newspaper reporter did. The newspaper reporter got an idea one day that the city was nothing more nor less than a vast, broken mirror giving him back garbled images of himself.

The newspaper reporter was trying to write fiction stories on the side and he thought: "If I can figure out something for a background, some idea or something that will explain about people, and then have the plot of the story sort of prove this general idea by a specific incident, that would be the way to work it."

Thus, when the reporter had figured it out that the city was a mirror reflecting himself,

he grew excited. That was the kind of idea he had always been looking for. But at night in his bedroom when he started to write he hit a snag. He had thought he held in his mind the secret of the city. Yet when he came to write about it the secret slipped away and left him with nothing. He sat looking out of his bedroom window, noticing that the telephone poles in the dark alley looked like huge, inverted music notes. Then he thought: "It doesn't do any good to get an idea that doesn't tell you anything. Just figuring out that the city is a mirror that reflects me all the time doesn't give me the secret of streets and crowds. Because the question then arises: "Who am I that the mirror reflects, and what am I? What in Sam Hill is my motif?"

So the newspaper reporter decided to wait awhile before he wrote his story—wait, at least, until he had found out something. But the next day, while he was walking in Michigan Avenue, the idea he had had about the mirror trotted along beside him like some homeless Hector pup that he couldn't shake. He looked up eagerly into the faces of the crowd on the street, searching the many different eyes that moved by him for a "lead."

What the newspaper reporter wanted was to be able to begin his fiction story by saying something like this: "People are so and so. The city is so and so. Everybody feels this and this. No matter who they are or where they live, or what their jobs are they can't escape the mark of the city that is on them."

It was after 7 o'clock and the people in Michigan Avenue were going home or sauntering back and forth, looking into the shop windows, with nothing much to do. The street was still light, although the sun had gone. Hidden behind the buildings of the city, the sun flattened itself out on an invisible horizon and spread a vast peacock tail of color across the sky. In Grant Park, opposite the Public Library, men lay on their backs with their hands folded under their heads and stared up into the colors of the sky. The newspaper reporter stood abstractedly on the corner counting the automobiles that purred by to see if more taxicabs than privately owned cars passed a given point in Michigan Avenue. Then he walked across the street for no other reason than that there were for the moment no more automobiles to count. He stopped on the opposite pavement and stood looking at the figures that lay on the grass in Grant Park.

The newspaper reporter had been lying for ten minutes on his back in the grass when he sat up suddenly and muttered: "Here it is. Right in front of me." He sat, looking intently, at the men who were lying on the grass as he had been a moment before. And his idea about the city's being a mirror giving him back images of himself started up again in his mind. But now he could find out what these images of himself were. In fact, what he was. Whereupon he would have his story.

Being a newspaper reporter there was nothing unusual in his mind about walking up to one of the figures and talking to it. For years

and years he had done just that for a living—walked up to strangers and asked them questions. So now he would ask the men lying on their backs what they were lying on their backs for. He would ask them why they came to Grant Park, what they were thinking about and how it happened that they all looked alike and lay on their backs like a chorus of figures in a pastoral musical comedy.

The first figure the newspaper reporter approached listened to the questions in surprise. Then he answered: "Well I dunno. I just came into the park and lay down." The second figure looked blank and shook its head. The reporter tried a third. The third figure grinned and answered: "Oh, well, nothing much to do and the grass rests you a bit."

The reporter kept on for a few minutes, asking his questions and getting answers that didn't quite mean anything. Then he grew tired of the job and returned to his original place on the grass and lay down again and stared up into the colors of the sky. After a half-hour, during which he had thought of nothing in particular, he arose, shook his legs free of dirt and grass and walked away. As he walked he looked at the figures that remained. The arc lamps on the park shafts and on the Greek-like fountain were popping on and the avenue was lighting up like a theater with the footlights going on.

"Funny about them," the newspaper reporter thought, eyeing the figures as he moved away; "they lie there on their backs all in the same

position, all looking at the same clouds. So they must all be thinking thoughts about the same thing. Let's see; what was I thinking about? Nothing."

An excited light came suddenly into the newspaper reporter's eyes.

"I was just waiting," he muttered to himself. "And so are they."

The newspaper reporter looked eagerly at the street and the people passing. That was it. He had found the word. "Waiting." Everybody was waiting. On the back porches at night, on the front steps, in the parks, in the theaters, churches, streets and stores—men and women waited. Just as the men on the grass in Grant Park were waiting. The only difference between the men lying on their backs and people elsewhere was that the men in the grass had grown tired for the moment of pretending they were doing anything else. So they had stretched themselves out in an attitude of waiting, in a deliberate posture of waiting. And with their eyes on the sky, they waited.

The newspaper reporter felt thrilled as he thought all this. He felt thrilled when he looked closely at the people in Michigan Avenue and saw that they fitted snugly into his theory. He said to himself: "I've discovered a theory about life. A theory that fits them all. That makes the background I'm looking for. Waiting. Yes, the whole pack of them are waiting all time. That's why we all look alike. That's why one house looks like another and one man walking looks like another man walking, and

why figures lying in the grass look like twins—scores of twins.”

The newspaper man returned to his bedroom and started to write again. But he had been writing only a few minutes when he stopped. Again, as it had before, the secret had slipped out of his mind. For he had come to a paragraph that was to tell what the people were waiting for and he couldn't think of any answer to that. What were the men in the grass waiting for? In the street? On the porches and stone steps? They were images of himself—all “waiting images” of himself. Therefore the answer lay in the question: “What had he been waiting for?”

The newspaper reporter bit into his pencil. “Nothing, nothing,” he muttered. “Yes, that's it. They aren't waiting for anything. That's the secret. Life is a few years of suspended animation. But there's no story in that. Better forget it.”

So he looked glumly out of his bedroom window, and, being a sentimentalist, the huge inverted music notes the telephone poles made against the dark played a long, sad tune in his mind.

OTHER LITTLE BLUE BOOKS

(Order by Number)

By Ben Hecht:

- 698 Tales of Chicago Streets
- 699 Broken Necks, and Other Chicago Stories
- 1163 The Policewoman's Daughter, and Other Stories
- 1164 The Unlovely Sin, and Other Stories
- 1165 Jazz, and Other Stories
- 1166 Infatuation, and Other Stories

Italian Fiction

- 955 Italian Tales of Mad Heroism and Unconventional Romance
- 956 Tales of Love and Revenge
- 957 Italian Tales of Realism and Passion
- 958 Love Tales of Italian Life

PROSTITUTION IN THE MODERN WORLD

INTRODUCTION

Most historians accept the beginning of the sixteenth century as a convenient mark of division between medieval and modern times. In fact, however, the intellectual and social development which took place in the seventeenth and eighteenth centuries was much more important than that of the fifteenth and sixteenth. Europe in 1600 had far more in common with the civilization of the Middle Ages than with our own.

For the history of prostitution, nevertheless, the decade just preceding the year 1500 and the two or three succeeding decades are of particular significance. In 1492 Christopher Columbus discovered the West Indies. Among other things, the New World contributed to Europe tobacco, potatoes—and syphilis. In 1517 Luther posted his ninety-five theses upon a church door in Wittenberg. In 1529 Jean Calvin “became converted.” By 1500 the printing press had been fully developed. It helped to spread Greek thought throughout Europe. The capture of Constantinople by the Turks in 1453 had scattered Byzantine scholars and harlots through the western countries. The Italian cities were the first to benefit from the special knowledge of these two classes.

Only gradually did the Renaissance, the

Reformation, and the exploration of America change the manner of life of the common people of Europe. In general, medieval life continued for a considerable period beyond the year 1500. The harlot and her patrons in 1700 were much what they had been in 1300—not greatly different, in fact, from what they had been 1300 B. C.* But we are concerned chiefly with changes in making a history. In the period between 1500 and 1850, the conservatism which had been characteristic of the Middle Ages became less and less marked. Indeed a great upheaval became possible in France at the end of the eighteenth century. More lasting, perhaps, were the effects of the great Industrial Revolution of the late eighteenth and early nineteenth centuries.

*Little Blue Books Nos. 286 and 1111 deal respectively with prostitution in the ancient and in the medieval world.

SYPHILIS

The question of the origin of syphilis has not yet been settled to the satisfaction of all investigators. Some evidence favors the theory that this disease was unknown in Europe until after Columbus had discovered America. Other venereal diseases—probably gonorrhea and soft chancre, with which we are still familiar—appear to have existed long before then in the Old World. The ancient and medieval physicians were not able to distinguish the venereal maladies from each other or from certain other dermal affections. However, a great many skeletons of persons who lived in Europe and Asia before 1492 have been examined. These have not been found syphilitic. The old medical literature never deals with venereal disease of a general or systemic sort. It is possible that some of the men who sailed with Columbus brought the disease with them from Hayti in 1493 and 1494.*

Certainly it became epidemic in Europe at the end of the fifteenth century. The first great outcry came from Naples in 1495. When Charles VIII of France entered that city, he found it suffering from what the inhabitants called "the French malady." They believed it to have been brought by the French soldiers. The Spanish mercenaries whom Charles had

*See Dr. William Allen Pusey's excellent brief treatise on syphilis, Little Blue Book No. 903. The history of the disease has been dealt with in three large volumes by the late Dr. Iwan Bloch, *Der Ursprung der Syphilis*.

hired were no doubt directly responsible. A great horde of prostitutes accompanied the army, and the soldiers of that time did not hesitate to seduce or to rape the wives and daughters of honest citizens. Therefore the new disease spread with great rapidity. New maladies are always especially dangerous. Against the older infections a racial immunity gradually grows up. Early syphilis was considerably more severe than the syphilis of the present time. It is possible, indeed, that syphilis will in time cease to plague mankind. Of course it is not a necessary result of "sin." Like the rain, it is visited alike upon the just and unjust.

Francastoro, who wrote a poem about syphilis which was published in 1530, describes the symptoms of the disease:

The patients were low-spirited, their faces were pale. Most of them had sores upon the organs of generation. These sores, when cured in one place, reappeared in another, and the work was never done. Pustules with a hard surface appeared upon the skin. . . They burst after a few days, and discharged an incredible quantity of vile fetid fluid matter. When they began to suppurate, they became true gangrenous ulcers, eating away both flesh and bone. . . Some patients lost their lips, others the nose, others the whole organs of generation.

The *morbus gallicus* or French malady of Italy soon became the Spanish disease of England and the northern coast of Africa, the Castilian disease of Portugal, the Frankish or Christian disease of the Levant, the Portuguese disease of the Far East. Soon it was generally known that this dreadful infection was spread

by means of sexual intercourse, especially by prostitutes. Even before 1500, this knowledge led in several places to the abolition of all brothels. In a large number of cities, orders were issued that no harlot suffering from syphilis should continue to ply her trade.

Physicians were in general disinclined to undertake the cure of the new infection. Even the few who were willing to defy professional ethics found themselves altogether impotent to stay the course of the disease. The wood of the *lignum-vitae* tree was a favorite remedy. Pest-houses for syphilitics were soon established—in Venice in 1496, in Paris in 1497—but the inmates were left to die or to cure themselves as best they could.

It was well enough to issue decrees against syphilitic prostitutes, but usually the mischief was done before the authorities knew that a woman was diseased. Even after it became necessary to send physicians from brothel to brothel to examine the harlots, only those in whom the malady was considerably advanced were recognized as possible sources of infection. To this day, there has been found no infallible diagnosis for syphilis. The palpably diseased women were usually sent out of the city. Knowing nothing of other ways of earning a living, they were likely to resume their trade upon the highway or in some place where the authorities were less severe. Seeking such places, they naturally went to regions where the disease was still unknown. The primitive prophylactic methods served, then, chiefly to spread the in-

fection into the most remote regions of Europe and Asia.

In the Spanish city of Valencia, a system of medical inspection was inaugurated at least as early as 1501. Every woman who wished to enter a brothel was required to receive a certificate from the physician appointed to this duty that he had examined her and found her free from all contagious diseases, especially from the "French malady." A special department for venereal diseases was established in the municipal hospital. Here the prostitutes were treated when the official physician believed them to be syphilitic. The brothel mistresses were required to report all suspicious cases to him at once. At best, however, the sanitary control was of little advantage. The venereal department of the hospital was ordinarily overcrowded and filthy, and the municipal physician had little time to devote to any individual case. Yet the quarantine system was a great improvement over the banishing of infected harlots.

It was not until 1614 that the authorities of Paris opened a hospital which was in any way adequate for the care of syphilitic persons. Up to that year diseased prostitutes had not been received at any place for medical treatment. Men had been admitted in small numbers into the small venereal hospital already referred to and into the general hospital.

Between 1614 and the end of the century, syphilitic women who desired treatment had to submit to arrest as vagabonds. Accordingly they were severely whipped upon admission and

just before they were discharged as cured. It can readily be imagined that the prostitutes were not anxious to enter the hospital upon such terms.

Well into the eighteenth century, the diseased prostitutes of Paris had reason to avoid public medical treatment. In both of the hospitals which were open to them, food was bad and living conditions almost unbelievably unpleasant. We are told that eight syphilitic women slept in a single bed. Medical treatment—such as it was—could not be obtained for months after admission. The women waited their turn, their disease gradually becoming incurable. Facilities for bathing did not exist. There was very little bed-linen, and it was seldom or never washed. In one of the hospitals for venereal diseases, we are told, the average yearly mortality during the eighteenth century was one hundred women and sixty men.

Under the republic, many reforms were brought about. A new hospital was established for syphilis, with gardens and baths, and with ample facilities for treatment. Later the male patients were provided with a hospital for themselves. Previously they had been in the habit of amusing themselves with the women in adjoining wards. In the early part of the nineteenth century, a dispensary was founded for the treatment of persons who did not wish to be admitted to the hospital. It was found, however, that this system allowed dangerous women to engage in prostitution without interruption, and it was later abandoned.

Not until 1803 were the harlots of Paris required to submit to regular medical inspection. At first they had to pay a specified fee to the official examiner. He found it easiest to take his money without going to the trouble of examining the women. Later the method of medical control was improved, and better physicians were obtained for the work.

Soon after syphilis became epidemic in Europe, the problem of personal prophylaxis was considered by a number of physicians and others. Several pamphlets were issued warning young men to stay away from the brothels. Probably these had little effect, except for a brief period after the ravages of syphilis had first manifested themselves in a city. There can be little doubt that prostitution is proportionately less widespread now than it was during the Middle Ages. Yet the fear of syphilis is only one among a number of causes of this change.

Some of the devices and drugs used to prevent infection with venereal disease also serve to prevent conception. For this reason and because of the idea that syphilis is a divinely sent visitation upon sinners, their use has been condemned not only by priestly moralists but by scientists and physicians as well. The situation has changed a great deal since the sixteenth century in this regard, but there is still room for improvement. If all thoughts of sinfulness and shame were removed from the consideration of the venereal maladies, they could be handled much more efficiently.

If, as Krafft-Ebing pungently remarked, modern civilization is intimately connected with

syphilization, this is not necessarily true for the future. But prudery must not be permitted to conceal the fact that a grave problem exists, one which cannot be solved by the mere prohibition of extramarital sexual intercourse. The history of prostitution since the end of the fifteenth century justifies this conclusion.

In one way the fear of syphilis has operated to promote the growth of the brothel. It is far easier to carry out a regular medical inspection of women who are concentrated in a few houses than to deal with scattered prostitutes. The mistress or manager of the brothel has at times been required to assume a certain amount of responsibility in the attempt to take diseased women out of their profession. But the person in charge of such a house is not in sympathy with the rigid application of preventive measures. At least a third of all active prostitutes are capable of transmitting syphilis, gonorrhea, or both. Moreover, when a woman has once been infected with syphilis, even though she is properly treated, she is likely to transmit the disease if she has sexual relations within two or three years. The strict elimination of the diseased prostitute would require the brothel keeper to be forever replacing his women with young girls. As a matter of fact, the decline of the brothel in the nineteenth and twentieth centuries has been due in large part to the difficulty of such recruiting. The prostitute is in many respects better off when she lives by herself or in an apartment with one or two other young women.

From the point of view of the harlot herself,

the compulsory retirement from her profession is a greater danger than the ravages of disease. Usually she is fit for no other work, either because of lack of training or because the habits she has acquired make the labors she could perform seem exceedingly monotonous and exhausting. To be confined in a hospital is never pleasant. When the house in which medical care is given is at the same time a prison or something very like it, when it is a filthy place like the hospitals of old Paris, it is small wonder that the prostitute should avoid medical examination or bribe the examining physician when she can. The modern prostitute has had better reason than her medieval predecessor to avoid registration.

But we must understand that the attempts to control syphilis during the period dealt with in the present work (1500-1850) were only sporadic. Where laws existed, they were laxly enforced. The old idea that the brothel (or prostitution in some form) is an absolutely necessary evil persisted, despite the attempts at abolition with which we shall presently be concerned. Moreover, we do not even now thoroughly understand infectious diseases. What we do know has been almost entirely learned since 1850.

It was during the middle of the nineteenth century that Ricord and Virchow did their important work in the study of venereal diseases. The experiments of Metchnikoff and Neisser were performed in the twentieth century. Wassermann's method of diagnosis and Schaudinn's investigations fall also into our own time.

Even the best of the older specialists we must now designate as ignorant.

In 1497, King James IV of Scotland tried to drive all venereally infected persons out of the city of Edinburgh. They were to go in boats provided for them to Inchkeith, "and thair to remain quhill God provyd for thair health." Those who tried to evade the ordinance were to be branded on the forehead that they might be recognized immediately in the future. Now we know that such drastic measures are unnecessary. We know that almost always syphilis is spread in the sexual embrace, and we are familiar with the somewhat exceptional other ways in which the disease is transmitted.

For many years the regulation of the Middlesex Hospital, London, provided that every patient entering with a venereal disease should pay a special fee of forty shillings—which was a large sum in the eighteenth century. The directors thought that admitting syphilitics on the same basis with other patients would amount to the encouragement of vice.

It should be obvious that as a matter of public health the treatment of venereally diseased women—chiefly, although by no means entirely, prostitutes—is more important even than caring for men suffering from these diseases. In general, however, they were poorly provided for during the seventeenth and eighteenth centuries. The whole matter was considered from a personal rather than from a communal point of view. They were leading sinful lives, these scarlet women, and God had inflicted a proper punishment upon them. It

was almost forgotten that they were also sources of infection. Or if this was remembered, the prostitutes were simply ordered to leave the town.

THE PROTESTANT REFORMATION

When Martin Luther made his pilgrimage to Rome, in the year 1511, he was a devout Roman Catholic. What he saw in Rome made a Protestant of him. The evils of simony (the sale of ecclesiastical positions) and of nepotism (favoritism shown to the pope's relatives) were glaring enough. What impressed him most, however, was the sexual immorality which prevailed at the papal court. For Luther was not a cold and unworldly man, like the later reformer, Jean Calvin. Quite evidently it cost him a considerable struggle to live up to his vow of chastity. Rome was swarming with prostitutes and with the mistresses of high church officials. Religious zeal was altogether absent. The young German priest did not at once formulate a new creed. He did not immediately rationalize the reasons for his revolt against the medieval church. It was not until 1517 that Tetzel's sale of indulgences caused Luther publicly to proclaim his doctrine of "salvation through faith alone." Two years later the reformer declared that popes and general councils of the church were alike fallible. In 1525—and for us this is especially important—Martin Luther married Katherina von Bora, who had been a nun and therefore pledged, like Luther, to eternal chastity. Luther

had for some time been preaching against the ecclesiastical vows.

It is as natural, he said, for men and women to come together as it is for them to eat and drink and sleep. "The principle of marriage," he declared in one of his table talks, "runs through all creation, and flowers as well as animals are male and female." Therefore, priestly celibacy is absurd. It is a highly exceptional man, Luther thought, who is able to eliminate sexual life. Most of the priests of his time confirmed his opinion by actually engaging in fornication. Would it not be much better, asked the Protestant reformer, if they should be married and bring up children whom they might openly acknowledge as their own?

Luther believed in the inferiority of woman. The wife, he emphatically declared, should submit herself to the will of her husband. Nevertheless he was not in favor of a double standard of sexual morality. He approved the bigamy of Philip of Hesse and he declared polygyny to be better than divorce. Also he advised women who remained childless in marriage secretly to wed a second husband for the purpose of securing legitimate children, whose paternity should be ascribed to the first husband. For woman is incomplete except in maternity, he thought. Luther spoke fervently against the medieval view that women are repulsive and that they alone are sinful and dirty.

But he had little sympathy with the view that prostitution is a necessary evil. He knew from personal experience that continence be-

fore marriage is possible even for sensually inclined young men. The idea that it is necessary to sow one's wild oats early in life he denounced as heathenish. Therefore he spoke out plainly against the toleration of the brothel. In one of his writings he warned the university students of Wittenberg against the prostitutes of the town. "For such a French harlot"—meaning one diseased with syphilis rather than one who had come from France—"can ruin ten, twenty, thirty, or a hundred honest people's children, and she is therefore to be considered a murderess, far worse than one who administers poison."

Luther spoke chiefly in terms of religion—fornication is prohibited in the Bible—but the fear of venereal disease helped somewhat toward the favorable reception of his abolitionistic views. We find both Catholic and Protestant cities of the Holy Roman Empire attempting to drive out prostitutes, but the tendency was strongest in the Lutheran territory. When the authorities of Nuremberg closed the city brothel in 1562, they explained that the spread of syphilis as well as the preaching of several Protestant ministers had influenced them to this decision. In Ulm the "women's house" was closed in 1530 as the result of a number of denunciatory sermons. The same thing happened at Frankfurt and other cities. Not in every case did the brothels remain long under the ban, however.

As for Luther himself, he came toward the end of his life to modify his views concerning

matters "of the flesh." Sexual desire began to appear like a hereditary disease inherited from sinful old Adam. His friend, Melancthon, said very clearly that it is better to remain chaste than to marry. If Luther advised monks and nuns to marry, this was because he thought that they were almost sure otherwise to engage in fornication, homosexual acts, or masturbation. He wanted them to commit the lesser sin rather than the greater. The sexual act, even between husband and wife, he branded as unclean. When they do cohabit, he thought, this should be for the purpose of begetting children, not for their own pleasure. Of course, he demanded an impossibility. Moreover, it is well to notice, the existence of such a theory has often led to an increase in extramarital sexual relations. If congress with one's wife is intended merely for the production of boys and girls, husbands are wont to seek the delights of love elsewhere. We have but to think of the Pathan proverb: "women for breeding, boys for pleasure, melons for delight." Perhaps it would be fair to ask if Luther himself defied the canon law and took a wife to himself only because of Jehovah's command to the Israelites: "Increase and multiply." But in a measure he defended himself against such a criticism when he said: "We are all fornicators." To this the Catholic church could only reply by exhibiting an actually chaste body of persons consecrated to religion.

A reform of that nature could not be brought about immediately. That it has to some extent been accomplished is only in part the work of

the Roman ecclesiastical authorities. The fact that the religious vows are not absolutely binding for life is the greatest aid to the chastity of the secular and regular clergy. If a man finds that the promises he made as a mere child are difficult to keep in his full maturity, he may be able to make his own way in the outer world. The enterprising and ungodly monks of the sixteenth century considered how they might best beguile their time with fair nuns or with the wives of honest citizens. The rebellious monk of our time wonders if he will be able to earn a livelihood outside the walls of his monastery. No longer can he be compelled to return.

According to Professor Carlton Hayes, the Reformation brought about a condition in which "the individual faithful Catholic or Protestant was encouraged to vie with his neighbor in actually proving that his particular religion inculcated a higher moral standard than any other." There is a certain amount of truth in this statement. Yet the deists and other skeptics of the eighteenth century still found a broad target in the sexual irregularities of the clergy. It seems to me that their attacks did more to bring about a reformation within the Catholic ranks than did the writings and the sermons of Luther and Calvin.

Some of the more radical Protestant groups which sprang up in Luther's time practiced promiscuous sexual relations. In their eyes their moral standard was no doubt higher than that of the Catholics and the Lutherans. It is distinctly against the commands of Christ, they

argued, to hold property of any kind individually. Among the Moravians or United Brethren it was customary to mate men and women by lot, because of the doctrine that they should not seek individuality but the spirit of Christ in one another. We need not enter here into the history and practices of various communistic sects, although they have played an important part in the social history of Europe and America. Every student in the present field must soon learn, however, that religious zeal is by no means always the enemy of sexuality. Mysticism and pietism are not at all synonymous with sexual chastity. Frequently the leaders in such movements are sexually hyperesthetic.

But even a sincere asceticism defeats its own purposes. This we must bear in mind as we consider the career of Jean (or John) Calvin and the history of that type of Protestantism which has been named after him. Born in France of middle-class parents, he was educated for the church. When his father suggested that he should become a lawyer instead, young Calvin agreed, largely because he saw that the ecclesiastical establishment was thoroughly corrupt. At the age of twenty, however, he suddenly decided that he had work to do as a reformer. Quickly he became a leader among the Frenchmen who wished to purify the church.

Forced to leave his native country, he settled in the Swiss city of Geneva, where his power soon became very great. Not only was he chief preacher but also political head. There

was first developed that Puritanism which—not without alteration, to be sure—is so mighty and so harmful in the United States today.

Calvin was calm and cold and ascetic. His first thought was to suppress prostitution. But this was by no means enough. He forbade the celebration of holidays, he closed the theatres, he stopped all festivities, he denounced all joy. John Knox, with a temperament like Calvin's own, carried the new doctrines into Scotland, where they flourished under the name of Presbyterianism.

Of course it is impossible that Calvinists and the sons of Calvinists should all be such men as Calvin and Knox. Therefore it has often happened that the repression of gaiety has brought about a quiet epidemic of fornication and various sexual aberrations. This happened in Puritan New England in the seventeenth century. It is happening in the American Middle West at the present moment. To close all brothels is difficult, to suppress prostitution is almost impossible—but when the reformers succeed so far, they cause the normal male to try his hand at the seduction of women not engaged in the profession. The normal young female, too, must have excitement in one form or another.

An excess of Puritanism may sometimes be succeeded by open libertinism. This was notably the case for some time after the Restoration in England. People acted then as if they were anxious to make up for lost time in the gratification of their passions.

Catholic pietism, to which the Protestant

revolt gave something of an impetus, has never in modern times been as thoroughgoing as that of the Calvinists. "For the good are always the merry," as Yeats makes his Irish fiddler sing, "save by any evil chance." In general, the Catholic priests understand human nature, and they do not try to force asceticism upon the community at large.

In the sixteenth century, indeed, chiefly because of the syphilis epidemic, but also because of the new pietism, a number of Catholic preachers denounced the brothels. As the result of their efforts, houses were closed in Naples, Palermo, Valencia and various French cities. Prostitution was forbidden also in a number of Catholic towns in Switzerland and the German states. But these successes of the abolitionists were only temporary. There were too many economic considerations involved. Presently the Catholic church returned to its teaching that the brothel is a necessary evil. The fact that the popes received large sums in taxes from the prostitutes helped greatly to make them accept the old teaching of St. Augustine.

THE RENAISSANCE

In such a humanist as Petrarch (1304-1374) we find the indications of a struggle between the medieval, Augustinian view of love and that held in the old classical countries. Though Francesco passionately loved his Laura—who was probably a married woman, incidentally—he did not openly rebel against the medieval idea that love between man and woman is sin-

ful. On another woman he begot two children. Thus he acted like many another monk of the Middle Ages. But the papal city of Avignon seemed to him "a hell on earth." As he declares, it "contained everything fearful which had ever existed or been imagined by a disordered mind."

To some of the later humanists no difficulty presented itself. Accepting the medieval teaching that the sexual impulses are the result of the fall of man, they took over also the practical morality of the Middle Ages. To this they added the Greek tradition, so far as they could understand it from books and from the courtesans who came from the Byzantine east. The Greek spirit was alien to them.

In many ways the blending of the medieval and the revived ancient had rich cultural effects. Certainly the civilization of the important Italian cities in the fourteenth, fifteenth and sixteenth centuries deserves our ample admiration. The foundations of the new culture were Greek, Roman, Gothic (or western medieval) and even Mohammedan.

The revival of pagan literature constituted one aspect of the Renaissance. Regarded at first with suspicion by the Catholic authorities, it won over at the beginning of the sixteenth century, many churchmen, including the popes Julius II and Leo X. The father of Leo X, Lorenzo de Medici, called the Magnificent, had been renowned as a poet, a scholar and a patron of literature and art. He had established a library of Latin and Greek works in Florence. The son did not lose his taste for life and

letters because of his ecclesiastical position. Many of the popes of this time were worldly. Some were, judged by most moral standards, pretty vicious men. Others had a normal taste for pleasure unspoiled by too much thought about the other world or their position as Vicar of Christ in this one. At least one or two had little faith in revealed religion.

Medieval art had been concerned almost entirely with the church. The cathedral, the sacred painting and statue, the hymn, had been the principal products of the great artists. Even erotic art had been largely ecclesiastical; a beautiful woman offering her breast to a child represented the Virgin Mary, a seductive maiden revealed in her nakedness was a Christian martyr being thrown to the lions or cast into a lupanar for refusing to worship the heathen gods.

The painters and sculptors of the Renaissance looked back to the classical masters. They did not give up their work for the churches all at once, but they soon discovered that the Roman and Greek artists had done much in the service of sensual pleasure. Specifically erotic (one might almost say aphrodisiac) literature and art assumed great importance in the sixteenth, seventeenth and eighteenth centuries. The same artists who portrayed saints were also interested in the delineation of courtesans.

A Spanish priest, Francisco Delicado, wrote a book called *La Lozana Andaluza* (The Pretty Andalusian Woman) which was published in 1528. This was evidently modeled after Lu-

cian's dialogues. The heroine is a gay Spanish girl who comes to Rome where she is at various times prostitute, bawd, or both. After many adventures she finally decides to abandon her old calling and live a holy life.

Famous are the *Dialogues* of the "divine" Pietro Aretino. Here the life of the Italian prostitute of the sixteenth century is fully described. Of its kind the book is an undoubted masterpiece. But great works of this sort are not discussed by prudish school teachers and literary critics. Nor, in general, are they available to the reader who is limited to English books. John Cleland's *Memoirs of a Woman of Pleasure* (London, 1749) is said to be the only pornographic book originally written in English which has any considerable literary merit. Of course many great works of the eighteenth century and of earliest times discuss sexual matters with a freedom not permitted to present-day writers. Still, our youngsters are not likely to rush to read *Tom Jones* while confession stories are available. The erotic episodes in *Tom Jones* are too far apart.

The Renaissance, beginning in Italy, spread through all Europe. Its full flowering took place in the northern Italian cities in the fifteenth and sixteenth centuries. "The Englishman Italianate," the English traveler of the sixteenth century who stayed in Italy long enough to be influenced by the new fashions, perhaps brought home to his own country a love for Latin and Greek literature and for the painting, sculpture and architects of Florence, Rome and Venice. He was more likely to be

influenced by the improved table manners, to tell his friends about the luxuries of the rich. If he attended at a cardinal's dinner table, he was likely to notice that the vase into which fruit-rinds and bones were thrown was made of heavy silver. Perhaps he would not notice that the vase was the work of an artisan who was also a great artist. Certainly he could not help learning much about the sexual aberrations. All that the Greeks and Romans had discovered about sensual delight was put into use by the wealthy amateurs of Italy. The poor and the inexperienced followed as best they could.

In sixteenth century Rome, a great genius might kill and rob almost with impunity. When Benvenuto Cellini was unable to defend himself, he found popes, cardinals and great lords eager to come to his defense. Vulgar counterfeiters were hanged, but those who were able to design coins for the pope were freed and paid well for their work.

But our English traveler, coming from a country which was still medieval, could perhaps not understand the new worship of beauty. He could only see vices which were strangely very attractive, fine cloths and precious metals and diamonds which were frequently stained with blood. Loveliness and such an eager clutching at the pleasures of life that sudden death was common: this, in a brief summary, was the Italian Renaissance. By the casual student perhaps it may best be understood through a reading of the *Memoirs* of Cellini.

The greatest esthetic hindrance to perfect love-making was the prevalence of the "French disease." Many a great man suffered from it, with considerable inconvenience and pain, but hardly with any resulting shame. Cellini believed himself to have acquired syphilis from a girl of thirteen or fourteen, the maid of a Bolognese courtesan called Faustina. The latter, he tells us, "was : very beautiful woman, though she was about thirty years old." The woman ripens quickly in the warm south.

Faustina was no brothel wench, like the prostitute of the medieval town. She had fine jewels and clothes, she was attended by a servant. And she was one of class. The hetaira of old Greece was revived in her. It became possible once more for a harlot to have an individuality of her own, to exert an influence upon literature and politics.

Most of the fine courtesans, to be sure, were distinguished for personal beauty alone. But that in itself, to the Hellenizers, was equivalent to virtue. Cellini tells us that he was universally trusted because of the symmetry of his face and body.

Some of the courtesans who were most sought after were actually of Greek or Byzantine origin. These were supposed to be most familiar with the finer arts of love. Women came from all over Europe to Rome, Venice, Naples, Bologna and Florence. Some of them remained. If they were attractive, they found prostitution not unprofitable. Some of them returned to their own countries to spread the gospel of a luxurious and refined sexual system.

Like the hetaira, these women might often be concubines or mistresses. But usually such relations were only temporary. A girl might stay a few years with a priest, then live for a while with a wealthy merchant, then find herself abandoned in favor of a younger and fresher lass just come from Spain or the Low Countries. For a while she might give herself to any man who could pay a moderate fee. Finally at thirty-five or forty, she would be considered an old woman. If she had saved some money, she might comfortably retire, with ample time to say prayers and do good works, that she might be forgiven for the sins she had committed. Otherwise she might become a procuress, or assist in the dressing and beautifying of the new beauties. She might even dabble—as the gay Andalusian woman did—in magic and the cure of the French disease. Or if she were particularly unlucky, she might herself die of that malady while still a young girl.

A very few of the Italian prostitutes of the Renaissance were well educated and intelligent women. Many of them had some knowledge of literature and music. Some of them were famous for their wit and for their brilliancy as conversationalists. But they had no monopoly in this respect. Considerable freedom prevailed among honest matrons, who competed in wit and fine clothes with the courtesans. To be sure, the men were more ready than the women to concede the beauty and the intellectual attainments of the gay ladies.

One or two of the courtesans distinguished themselves as poets. Others dabbled in the

fine arts. Many more contributed indirectly to the culture of the *cinquecento* by inspiring writers and by serving as models to the famous painters and sculptors of the age. Their work was rather to be beautiful than to create beauty. The cosmetic arts assumed great importance.

The daily bath came into favor among the better courtesans. Soap and water were supplemented by costly perfumes. It appears that chaste women slowly learned from the prostitutes the advantages of bathing. The ideal of cleanliness came into the modern world for cosmetic rather than sanitary reasons.

Among the Italian women of the sixteenth century, whose hair was in most cases naturally dark, blond beauty was in high favor. Practically all the prostitutes not endowed by nature with golden tresses employed bleaches of various sorts and exposed their hair to the rays of the sun.

The better known courtesans spent large sums of money on clothing and jewelry. It was a time when men, too, paid much attention to their clothes, when some poor fellows wore their whole fortune on their backs. Changes in fashion came quickly. Those prostitutes who were able to do so carefully copied the richly decorated robes of the court ladies.

It has been argued that the courtesans set the fashions, and that the wealthy matrons followed where they led. Perhaps this happened in some cases, but usually it was the other way. For the more distinguished and more fortunate prostitutes, who might possibly have

led the fashions, were anxious not to advertise themselves for what they were. The young girls new to the profession might cover their faces and their bosoms with red and white. This was necessary, also, to the harlots of a lower grade, who found patrons where they might. But the women of the hetaira class practiced the refinements of luxury. In general, they employed paint and powder and dyes, not to direct attention to themselves in a glaring way, but simply to mend the defects of nature. After a sleepless night, we find one experienced old woman advising a young courtesan, it is very well to apply a little rouge to pale lips to make them assume their natural color. But red and white should never be smeared on crudely.

The half-concealing, half-revealing which the prostitute always and the chaste woman frequently has practiced now is chiefly a matter of the legs. A century ago it was customary to accentuate the buttocks. (The mannish modes, tight-fitting knickers and riding breeches still show a tendency in this direction.) In earlier times, the half-nudity against which preachers declaimed most frequently meant the revelation of the breasts. This is characteristic of the Italian Renaissance and then of the French Revolutionary period.

The special garments and badges which the medieval prostitutes had been forced to wear came gradually to be abandoned. The sumptuary regulations fell into desuetude. A lady who stepped from a splendid carriage with a graceful nod to her pages and other servants

might be the wife of a rich merchant, the mistress of a cardinal, or a courtesan who gave her favors to all who were able to pay the price. Chaste matrons wore splendid silks and satins and cloths that were heavy with gold. So did the prostitutes who could afford such luxuries. The poorer harlots imitated their luckier sisters as best they could. Many who wore clothing worth a small fortune at the height of their careers were soon after begging on the streets. In this they followed the spirit of the age. However, the customary attitude toward dress simply accentuated the love of splendid ornamentation which still drives so many women into a life of prostitution. We may consider it a form of exhibitionism, a by-product of the sexual life. As every woman knows, fine clothing is not worn simply to attract the male. Nor is it intended merely, as skeptics sometimes say, to make other women jealous. It is an end in itself.

Many a good mother of sixteenth century Italy stayed awake nights wondering if her Giulia or Margherita would not be best off as maid and apprentice to the beautiful Imperia or some other celebrated courtesan. It would be sinful, a little, of course. Perhaps it would be better to have her enter a convent. Then she would be surer of the delights of the world hereafter. She might marry, but without a dowry, without money for a trousseau, who could she get other than a journeyman tailor or perhaps some old widower of a grocer?

On the other hand, such a beautiful girl could not help prospering as a lady of the pleasure

giving profession. She would have many delights, too. Poets and painters and great churchmen would come clamoring to her doors. Her haughty doorman would announce, "My lady is occupied," whenever some less desirable patron presented himself. There would be many servants, of course. Naturally the fond mother would picture the magnificent palace, hung with amazing tapestries, furnished with all sorts of golden ornaments, which her daughter might have. As for her certainly very venial sin, she could make up for that by keeping images of the Virgin and Mary Magdalene in her bedchamber. She would cover them or turn them to the wall when a man came in, of course. And she would have money, large sums of money, enough to give many candles to the church, or even to found a charitable institution of her own. For all this was truly possible to a woman whose beauty and wit won the favor of the rich.

At best, of course, the path of the courtesan was one where thorns were mingled with the roses. Her career was necessarily a short one. After ten or fifteen years of boundless luxury came inevitably a swift descent. Very few prostitutes had any money left after their beauty had declined. Their impulse was always to spend the whole of their income without thought for the morrow. After all, it would have been fatal to consider the future too anxiously. It was always likely that the French disease should sweep them suddenly into the grave. Some jealous lover might come in stealthily with his sword or his stiletto.

Besides, prostitution is not a thoughtful profession, in general. Never, even in the Italian Renaissance, have the majority of courtesans been intellectuals. They lived for the day, never letting the dregs of the future spoil the wine they were drinking with gusto.

After their lovers stopped coming and gifts no longer poured in, there were many positions connected with prostitution which they might still fill. Especially if they were clever, they became bawds, hairdressers, compounders of beautifying and syphilis curing salves. Or they were given work in the kitchen or the boudoir of some courtesan whose beauty was still fresh. If all these failed, they might still beg on the streets. Surely people would be kind. Or charms enough to attract a poor apprentice or a drunken sailor might still remain.

In truth, most harlots never won any great amount of luxury for themselves. They lived in poorly furnished rooms, hardly able to pay the rent. A generous fee went immediately to purchase stuff for a fine gown. A week later it might be necessary to sell or pawn the robe. Mary Magdalene was not always generous to the girls whose patron saint she was. Sometimes magic formulas failed, too. Still, there was always the possibility that some magnifico or ambassador might catch a glimpse of the gay lady's throat and shoulders, becoming her slave forever. Tulla and Angela, who were no more beautiful, had hosts of servants at their beck and call, they reasoned. The

possible rewards were great, or seemed to be great. Actually the miseries were greater still.

Some prostitutes were fortunate enough to contract good marriages or to become the permanent concubines of churchmen. Others were received into Magdalene houses or convents. The mediæval notion that it is a virtuous act to wed a harlot or in some other way to draw her out of her profession persisted in the Catholic countries. This did not invalidate the doctrine that prostitution is a necessary evil.

As a matter of fact, many learned and eloquent upholders of the old religion had ample opportunity to discourse with the courtesans about the sinfulness of their ways. But perhaps they found more interesting things to talk about. Not necessarily love, of course—it might, as we have seen, be about the newest work of Michelangelo or even about Horace and Theocritus.

The word *courtesan*, we may pause to notice, is probably derived from the French *courtisane*, meaning a female of a princely court. Directly or indirectly it comes from the Italian *cortegiana*, which we find in the sixteenth century applied chiefly to the hetaira, but also to harlots of all degrees. From this bit of etymology it would appear that the court mistress gave tone to the higher grades of prostitution. She might be the wife of a courtier who was something more than gracious to her prince. She might be some peasant's daughter whose beauty had brought her suddenly into high society. Certainly refined and luxurious prostitution as it was practiced in the *cinquecento*

was not merely an echo of old Roman and Greek conditions. It has been developing during the latter centuries of the Middle Ages, chiefly at royal, papal, and other princely courts. As wealth came pouring into Italy and a flood of pagan ideas was released, it became possible for the courtly luxuries to spread among the merchants and the artists. Later all forms of Italian culture were propagated in France, England, the Low Countries and the Holy Roman Empire of the German nation.

Throughout the Middle Ages, homosexual prostitution remained firmly rooted in Italy, despite the vigorous efforts to extirpate it which were made from time to time. The new freedom and the revival of Greek ideas made it much more important at the time of the Renaissance. The worship of beauty extended to the male as well as to the female form. When Luther came to Rome, he found pederasty very widespread. This was one of the things which caused him to attack the papal system.

Even in earlier times, the courtesans of Italy had felt the keen competition offered by male prostitutes. In Venice they were for a time accustomed to wear men's clothes and to dress their hair like boys, hoping thus to attract bisexual patrons.

From Italy the epidemic of homosexuality was transmitted to France. King Henry III became renowned as a seducer of men and women both. Under Louis XIV, homosexual clubs flourished at the court. At the time of the Restoration, pederasty flourished among the English nobles.

SOCIAL AND INDUSTRIAL CHANGES

We have not sufficient room here to enter into all the changes in social organization which distinguish modern from medieval times. Yet they are more important for the history of prostitution than legal enactments and philosophical or theological theories. It should be obvious that the harlot's profession is not the same in the city that it is in the country, that it is something else when slavery or serfdom flourishes than it can be among free citizens, that it is much affected by the growth of luxury and the development of commerce. At the risk of being superficial, then, we must consider some of these matters.

At the beginning of the sixteenth century, the great majority of the people of Europe were engaged in agriculture. They lived in little villages, in almost complete isolation from the rest of the world. Occasionally peddlers and strolling musicians came to visit them. Their world was a single hamlet and the farm land surrounding it. Their idea of magnificence was the cathedral in the nearest large city—which perhaps they had only heard about but had never seen. Townsfolk had a less limited horizon. They came into contact with merchants who had traveled far. Religious pilgrimages and several great wars, notably those against the Saracens, had done most to bring men of different nationalities together. Nationality amounted to little until the sixteenth and seventeenth centuries, however. Ordinary people had little in common with

those who lived more than a day's walking distance away. Scholars had a common language in Latin. The church and the universities were international. The canon law, especially important for violations of sexual morality, prevailed over most of Europe.

Going from medieval to modern times, we pass from comparative uniformity to great diversity. Some regions developed quickly, in others industry and commerce remained for a long time as they had been in the Middle Ages. People began to think in terms of patriotism. Even where national unity came late, as in Italy and Germany, the growth of standard writing and speech broke down the old internationalism as well as the old provincialism. Instead of a single hierarchy and ritual through all western and central Europe, a complexity of ecclesiastical organizations appeared. Some, but not all, of the new church systems were national in nature.

At the same time, communication between countries and between continents vastly increased. Coffee and tea were brought in, and soon the coffee houses and tea rooms were serving the purposes of prostitution. Perfumes from far countries sweetened the courtesans of Venice and Paris. Tobacco came from America. Presently there were tobacco shops, where, especially in the German cities, panders and harlots were frequently to be found. Prostitutes quickly came to like the cigarette. So familiar did this connection become that women who smoke are still condemned as immoral.

Alcoholic drinks had been much in use dur-

ing the Middle Ages. Probably the *per capita* consumption has steadily increased since the sixteenth century, nevertheless. Workingmen have had more money to spend on such luxuries. Brandy and gin became the favorite drinks of the lower classes. The rich began to pay close attention to the quality of their wines. Champagne has been much associated with the highest strata of prostitution.

All through the period with which we are dealing, the taverns and wine-cellars were closely connected with prostitution. The cabaret, in our present day use of the word, developed in eighteenth century France. The taverns of England, which were somewhat less luxurious, also served as places of rendezvous or as brothels.

The development of commerce and industry caused the rise of great cities. London had about 35,000 inhabitants in the fourteenth century, about a quarter of a million in 1600 nearly 700,000 in 1700, and it was approaching a population of a million in 1800. Paris, which was more important during the Middle Ages, had then perhaps a hundred thousand inhabitants. In 1700 it had half a million, and about 650,000 at the outbreak of the Revolution. Vienna, with possibly 50,000 people during the Middle Ages, had four times as many by 1800. Hamburg, which was an important commercial city in medieval times, had then about 20,000 people. In the eighteenth century it had about a hundred thousand. Many places which were mere villages in the Middle Ages were great cities by 1850. This represents not merely the

national increase of population. There has been a steady movement from country to city since 1500.

The growth of free prostitution in the first modern centuries was perhaps part of the general movement toward the freeing of industrial, commercial and agricultural life. The French Revolution brought about the repeal of many bothersome restrictions, but the guilds and the paternalistic rules of the Middle Ages had for some time previously been decaying.

Spain was of great importance in the sixteenth century, partly as the result of colonial acquisition. Perhaps half the population depended at one time upon trade and industry, especially upon the manufacture of silk and woollen goods. But intolerance exterminated or drove out the Moors and the Jews, who had been the principal traders and manufacturers. For centuries Spain remained a poor agricultural country. Only recently has a second development of commerce and manufacture come about. A number of Italian cities which had been important at the close of the Middle Ages sank into decay in the seventeenth and eighteenth centuries. This was notably the case with Venice.

But in general growth was steady. England and the Low Countries developed quickly in the first centuries of modern times. Then Germany, especially Prussia, increased in importance. As the medieval shackles fell off, the scientists went to work with a will. Soon their discoveries become the bases for inventions and mechanical improvements which were des-

tined to make the great cities and even the fields of grain assume an appearance far different from that of the year 1000.

The Industrial Revolution took place in England in the last decades of the eighteenth century and in the first two or three of the nineteenth. Then it spread through the rest of Europe to America and to Asia. It consisted of the development of machines and methods of transportation and the building of great factories. The machines made it possible for one farmer or town workman to do the work of many laborers equipped with crude tools. They brought wealth not only to the successful *entrepreneur* but also to the proletariat. It is hardly an exaggeration to say that the beggar of our times possesses more luxuries than the medieval king.

The new capitalists, sometimes attaining great wealth, soon began to set the pace in luxury and fashion. In the medieval days, a courtesan's great ambition was to prove pleasing in the sight of a monarch or feudal lord. In sixteenth century Italy, a cardinal or a merchant prince might be expected to be liberal. In eighteenth century France, the farmers of the taxes gave tone to "high life." More recently, the sons of self-made millionaires have constituted the most profitable patronage of the more cunning purveyors of pleasure.

The social readjustments incident to the Industrial Revolution brought about a greater semblance of poverty than had previously prevailed. Actually the peasants of the Middle Ages had lived much more precarious lives.

At best, they had coarse food enough to eat, cheap beer or watery wine to drink, rough clothing enough to wear. In time of famine, there were no reserves of food and no easy way existed of bringing supplies from a distance. When the country people got very hungry, they sometimes revolted against their lords. But usually they starved to death without much ado. Toward the end of the eighteenth century, it was still possible for a queen of France to ask, "If they have no bread, why do they not eat cake?"

But the crowding of the proletariat into the slum districts of poor cities made poverty more glaring. Especially during the first years of the Industrial Revolution, the introduction of new machinery was wont to throw a great many skilled workmen out of fairly profitable positions. Whereas the general effect of the new methods was to increase the wealth of all classes, any given change might prove disastrous to large numbers of people.

Let us consider, for example, a weaver. Perhaps he had several skilled journeymen in his employ, each capable of weaving two pieces of shirting per week. Machines were introduced with which an inexperienced child could make ten or twenty such pieces in the same length of time. The price of shirting fell, to the ultimate advantage of all. But this was small consolation to the weaver whose business was ruined. He had to give up the few petty luxuries to which he was accustomed. Then he found himself unable to provide even the necessities of life for his family. Perhaps he sent his chil-

dren to the new mill to work for a pittance. His daughters, no longer able to depend upon their father for a new dress or a cheap bracelet, were easily tempted by wily bawds. If they went to work in a factory, they were treated with scant respect. At times the supply of laborers so greatly exceeded the demand that wages hovered about the amount just sufficient to keep the working people alive. The capitalists, into whose hands wealth was pouring, possessed great political power. A law was passed by the British parliament in the early nineteenth century which forced pauper children to work. Boys and girls of five and six were chained to machines for thirteen or fourteen hours a day. The overseers became accustomed to the methods of slave-drivers. If the weaver's daughters overslept a little and came to work at five minutes past six instead of at six o'clock, they were likely enough to be met at the door by a foreman with a whip in his hand. The mill superintendents and overseers of twentieth century New England, simply through their power to discharge, have often enough forced their female employes to grant them great favors. To the bewildered boys and girls who were thrust suddenly into factories in England at the beginning of the nineteenth century, a foreman seemed very like a god. Under the old laws regulating the conduct of master and servant, he had the right to chastise lazy or insolent working people.

The sexual morality of the girls who worked in the mills was naturally not very strict. To be taken into a brothel was a clear gain. There

was more time to sleep and practically no work to do. Food could not be much worse and clothing was almost sure to be better. Even if the master or mistress of the house proved tyrannical, the change was from one form of slavery to a milder form.

Due partly to meliorative laws but more especially to economic changes, these conditions did not last very long. Crowded slums still exist, of course; and it cannot be denied that poverty yet remains a factor of some importance in the supplying of prostitutes.

In the year 1848, a correspondent of the *London Times* visited a workhouse (or, as we should say, a poorhouse) in the city. He noticed that the children all seemed healthy and contented—a great change from the state of affairs twenty or thirty years before. He asked the master of the house what became of the girls. He was told that at the age of fourteen they were sent out to work, either as domestic servants or in other capacities, but continuing to sleep in the workhouse. However, nine-tenths of them eventually became streetwalkers.

During the period of our present survey, brothels became of less relative importance in most of the countries of Europe, although the number of prostitutes living in them rose somewhat. The lupanar did come into prominence in eighteenth century France, but since 1800 it has declined rapidly almost everywhere. Free prostitution, depending largely upon streetwalking, is the characteristic form in our own time.

The unattached courtesans soon learned that they might find patrons in a variety of public

and semi-public places. The cheap tavern where musical entertainment was furnished came into popularity in the seventeenth century, notably in Amsterdam. Prostitutes quickly drove out the citizens' families which had first been attracted to these resorts. The new clientele consisted largely of sailors. Erotic dances were introduced. Some of these taverns were in reality brothels, the upper stories being given over to rooms where the entertainers, waitresses, and female guests might retire with the male visitors in whose eyes they found favor.

Pleasure gardens, modeled after Vauxhall, the favorite haunt of Londoners, become popular in a number of European cities during the eighteenth century. At Vauxhall, as we can see from Fanny Burney's novel, *Evelina*, it was hardly safe for a chaste lady to walk unaccompanied. The dark walks particularly served the prostitutes.

Bathhouses as brothels or meeting-places for prostitutes existed in England all through the Middle Ages. They remained important down through the eighteenth century. The fashionable spas and beaches arose in several countries between 1800 and our own time. These proved useful to mistresses and courtesans of high degree.

The theaters have been much used in the service of prostitution. In Shakespeare's day, the playhouses were usually located near brothels. Perhaps the chief reason for this was the fact that both sorts of houses were by preference built in convenient locations which were yet outside the city limits. At this time, no

women appeared on the stage and most of those in the audience wore masks. The latter fact, although it enabled chaste women to see the play without damage to their reputations, also aided the well-known prostitutes, who might otherwise have been refused admittance to the theater. After the return of the Stuarts from exile, the relations between the theaters and the harlots became still more intimate. Female parts were taken by women, many of them of easy virtue. In France, during the latter part of the seventeenth century and throughout the eighteenth, the actress-mistress was a well-known type. In the lobbies and galleries of the theaters, prostitutes swarmed. In certain theaters they seem to have constituted an important attraction, for they were admitted without charge.

The great wars of the sixteenth and seventeenth centuries, when the brothels were losing some of their old importance, brought out a great many young women as followers of the armies. In fact, as we have seen, this situation had developed before 1500; and the army harlots helped to spread syphilis in Italy in the wars of Charles VIII.

As a result, wandering prostitution in general was greatly stimulated. The roadside harlots had much in common with the vagrants, strolling jugglers and players, runaway apprentices, cheats and robbers who infested the highways. Some of the women watched carefully for fairs, church councils, and other gatherings of crowds. Others joined pilgrimages and helped to entertain the holy travelers. Many served as decoys

for robbers and swindlers. In the cities, the districts where brothels and the lodgings of prostitutes were common were usually close to the haunts of criminals.

PROSTITUTION IN FRANCE, 1500-1850

We have considered various aspects of prostitution which were of European importance. Although we studied the Renaissance chiefly as it appeared in sixteenth century Italy, we noticed what the effects were elsewhere. Although our study of the Industrial Revolution was focussed chiefly on England around the year 1800, we observed that it spread through the civilized world. For the rest of this book, we shall be concerned chiefly with national and local tendencies, as shown in the laws and elsewhere. The French Revolution, indeed, with which we shall be concerned in the present section, was by no means a strictly national matter. Even before 1789, the eyes of the luxury-loving world were fixed on Paris. What Italy had been in the sixteenth century, France was in the age of Louis XIV. We shall therefore consider his reign, that of his successor, and the period of the Revolution itself more carefully than the other reigns.

Under Francis I, from 1515 to 1547, Italian influences began to be felt strongly, especially at the royal court. We are told that Francis dismissed the body of prostitutes which had been maintained at the court and called upon the court ladies to take their place. "The ladies of the town," says Sanger, "followed the example of those of the court, and but little was

wanting but that every woman in France became a prostitute." This is somewhat exaggerated, no doubt. Nevertheless it is certain that manners became very free.

His successor, Henry II, was very much devoted to his mistress, the celebrated Diana de Poitiers. If she had not been a courtesan, at least, as we are told, she had "obliged many persons" in her youth. The courtiers of the king indulged in sexual orgies, in which homosexual and other aberrations played an important part. During this reign there was a considerable importation of erotic statues, pictures, and other objects of art into France from Italy.

Catherine de Medici, whose influence predominated in the three following reigns, is said to have brought hundreds of Italian prostitutes with her to France. We are told that she employed these women for political purposes. They were charged with discovering the secrets of the court politicians and reporting them to Catherine.

Under Charles IX, a law was passed intended to suppress all the brothels of Paris. Violations were to be punished with the rod or the branding iron. Apparently the open brothels were indeed closed, but secret prostitution and private immorality increased. It was found necessary several times thereafter to repeat the order banishing prostitutes and bawds. An ordinance of 1635 established the penalty of condemnation to the galleys for life for all men concerned in the traffic of prostitutes. The prostitutes themselves, without formal trial, were to be whipped, shaved, and banished for

life. Obviously this law enabled the great noblemen and those commoners who had influence with the police to revenge themselves upon all women who had offended them. It does not appear, however, that public morality was particularly improved by these strict measures.

During the seventeenth century in France, edicts were passed by which the men who visited brothels might be fined. We have the record of at least one case in which this was done.

The police were given wide authority. Several times they made use of it to send Parisian mistresses and prostitutes to the French colonies in America. This practice is probably most familiar from *Manon Lescaut*, the book and the opera. Many of the loose women were married to prosperous inhabitants of Quebec and New Orleans. Others kept up the traditions of the French brothels beyond the seas.

It appears that during the period between 1724 and the outbreak of the Revolution, brothels were licensed or tolerated by the police despite the laws against prostitution. In fact, they were sometimes very noisy and riotous places, but they were never troubled unless the neighbors complained. It seems that certain streets were entirely occupied by brothels.

It is perhaps unnecessary for us to consider in detail the *liaisons* of King Louis XIV. The list of his mistresses is a long one. The most remarkable among them was Madame de Maintenon, widow of the poet Scarron. When she was introduced to the king, both had outgrown

their youthful passions. Presently she became an earnest pietist, and Louis came fully under her influence. For a period of twenty years, the standard of public decency in Paris was remarkably high. Intrigues were carried on quietly, smutty jokes were banished from the theater. In part it was a case with the king and his mistress of giving good advice when they could no longer set a bad example.

Under the Regency, this prudery—this high morality, if you will—collapsed. When Louis XV became old enough, he started his own career with courtesans and mistresses. Of these the Marquise de Pompadour and Madame du Barry were the most important. He caused to be built for himself a private brothel or seraglio and sent panders through all France to find girls of fifteen for him. Madame du Barry, far from objecting, acted as chief bawd. The children were thrust out after a short stay in the Parc aux Cerfs. Then they were usually enticed without much difficulty into the brothels of Paris.

Louis XVI and his wife appear to have observed a much stricter morality. Some of the princes and great noblemen ably preserved the traditions of Louis XIV's manhood and of Louis XV's, however. A number of private brothels—"little houses" was the euphonious phrase for them—were established by nobles and other wealthy men. Here prostitutes, mistresses, adulterous wives, and other women who could be seduced by fair words or hard cash were brought.

The "little houses" served comparatively few

men, but they set the fashion. A German traveler who visited Paris in the middle of the eighteenth century was impressed by the number of persons he found to be directly or indirectly supported by prostitution. There were hosts of pimps, some of whom went not only into the French provinces but through all Europe in search of attractive girls who might be enticed into the private or the public brothels. Men and women of all classes of society helped to recruit prostitutes. There is mention of a Catholic regular priest who engaged in this work. Many parents forced their children to become harlots. Especially when the agents of Louis XV offered large sums of money for pretty young virgins, they found a great many parents willing to rate wealth higher than chastity. To become the mistress of a king, they thought, was in any case no great disgrace. Meanwhile the law punishing bawds was still nominally effective. But such laws are not meant to restrict the actions of kings and noblemen and farmers of the taxes and bishops and other great and mighty people. They are useful to be directed against poor devils who do not stand in the good graces of the police.

The Parisian brothels of the eighteenth century contained French, Spanish, Italian, Dutch and German girls, with scattered representatives from other countries, including even a few Negresses. Some of the girls came from good middle class families. Some were drawn from the convents.

The houses were well advertised. Men stood

on the street to hand foreigners and strangers in the city the addresses of the brothels on cards which stated the specialties of each. There were also guides who walked upon the boulevards in the evening.

The minimum price was low, but men of wealth sometimes paid great fees to the better-known courtesans. These might be rented out to a man for a month or so, in which case the pander got a large part of the sum which was paid. The brothel managers derived large profits from the sale of food and wine. Frequently their houses also served for gambling, which, honestly or dishonestly, they made profitable to themselves. Occasionally pockets were picked by the master of the house, his valet, or his wench. When, as was usual, the head of the house was a woman, she was likely to be a retired prostitute, with more cunning than most members of her profession. The girls who lived in the house were practically slaves. Those who came from lodgings when the brothel was busy had much more freedom.

In the house of amusement called the Palais Royal, we are told that 1,500 prostitutes used to assemble nightly. Here there were theaters, restaurants, and fashionable shops, as well as furnished rooms and apartments in which some of the harlots lived. A few of the women of the Palais Royal were distinguished for their wit and beauty. But all tastes and practically all pocketbooks were accommodated.

A great many fashionable men and women were organized in clubs for the purpose of debauchery. These were important enough in

Paris and various provincial cities to constitute something of a competition to the professional harlots.

The police made use of their authority to serve their own lusts and those of the great lords. We are told of one Parisian chief of police, the Marquis d'Argenson, who installed his mistress in a convent that she might seduce the nuns for him. Later the police were required by Madame de Pompadour to report for the king's pleasure what had taken place each day in the brothels of Paris.

In the days of the Terror, republican France proved even better disposed toward the prostitutes than the sensual kings had been. The sadistic orgies brought the passions of men and women up to the boiling point. Life seemed cheap, and people rushed to make the most of their possibly few remaining days and nights among the living. At one time the prostitutes were accused of royalistic sympathies—for under the republic the great fees which kings and great nobles had paid them were no longer possible. Nevertheless they were vindicated and permitted to wander where they wished and to carry on their professions as seemed best to themselves. With the removing of all restrictions, there was a tendency to take young children into the brothels.

In 1798 was inaugurated a system of compulsory inscription and regular physical examinations for all prostitutes. This spread quickly over most of the continent of Europe.

In 1810, according to some writers, there were 18,000 or 20,000 prostitutes in Paris. If

we are to believe the police rolls, however, there were only about a tenth of these numbers. In the year 1832 the city contained 220 officially registered brothels. They were not permitted on certain boulevards and streets, or near churches, schools, or boarding houses. Each house was in charge of a woman whose name was enrolled with the police. The mistress was almost always one who had been a prostitute herself, but who had never been convicted of any crime. She was required to keep a careful register of the prostitutes in her house, stating among other things the date of each examination by the official physician.

At this time the chief recruiting ground for harlots is said to have been the Hospital du Midi, where venereally diseased women were treated. Also there were many bawds in the country towns regularly employed by the brothel mistresses. During the middle of the nineteenth century, there was a considerable international traffic in prostitutes. Some of the girls were more ready to ply their new trade at a distance from home. Others were led astray by promises of employment abroad in a theater or as teachers and governesses.

The Parisian brothel prostitutes of the 1840's and 1850's received no pay. They got food, lodging and clothes. If they wished some trinket or luxury, they had to borrow from the mistresses. Since they seldom were able to pay off such debts, they found themselves compelled to remain in the brothels, virtual slaves. The keepers of these houses often derived considerable profits from them.

Minor prostitutes had to secure the consent of their parents before being enrolled. There were various other provisions in the law intended to protect girls who had been forced into prostitution against their will or who were being cheated by the mistresses. To cohabit for pay or to solicit in a seemly manner was in itself not a violation of any law.

PROSTITUTION IN ENGLAND, 1500-1850

During the sixteenth century, there were several attempts in England to repress prostitution. It was possible to close the stews on the Thames for a while, but not to keep brothels from being established all over the city of London. Shakespeare had evidently seen women flogged for prostitution. He makes Lear—who has certainly had the experiences of an Elizabethan rather than those of an ancient Briton—call out in his madness:

Thou rascal beadle, hold thy bloody hand!
Why dost thou lash that whore? Strip thine own
back;
Thou hotly lust'st to use her in that kind
For which thou whip'st her.

Yet Shakespeare knew Doll Tearsheet of the Boar's-head Tavern, whom he presents in the second part of *Henry IV*, and many others of her kind.

The Puritans adopted extremely stern measures against the harlots. By a law of 1650, bawds were condemned to be publicly whipped, set up in the pillory, branded with the letter B, and imprisoned for three years. The death

penalty was provided for brothel-keepers and pimps who were twice convicted.

When Charles II "came home from his travels," the gay cavaliers overturned the morality of the Roundheads. However, the new debauchery had little influence on the middle-class population. Although Samuel Pepys stood just on the fringe of court society, he and his friends disapproved of the royal sports. Pepys was sympathetic with the Presbyterians, but he believed in ecclesiastical conformity, like a good citizen who was getting rich from sinecures, harmless bribes, and good will offerings. He took vows regularly against the drinking of wine, but he became "foxed"—drunk, that is—on occasion. He was capable of appraising an attractive leg, too.

The Puritans had closed the theaters. The plays that were produced after 1660 dealt freely with sexual relations. In general, they put the adulterer in a heroic light. Love intrigues were borrowed from French literature or invented by ingenious playwrights.

The outstandingly witty and attractive courtesan, whose type had arisen in the modern world in Italy and then passed over to France, came into prominence at the court of Charles II. In England she was usually an actress. Nell Gwyn was one of the most fortunate of these courtesans. As a child of twelve, she sold oranges in the Theatre Royal. The orange girls were considered to be all prostitutes. For a time, Nell sang in a tavern. A brothel mistress, attracted by her pretty face, gave her the rudiments of an education and taught her

something of singing. Several actors, meeting her in the brothel, decided that she had talents for the stage. She first appeared as an actress at the age of fifteen, by which time she had clearly lost most of her childish ingenuousness. Her royal master found her attractive and took her to be his concubine. She still continued on the stage, however, although her talents do not appear to have been of the first order. She seems to have been pretty and likable rather than strikingly beautiful.

Among Nell Gwyn's rivals for the favors of King Charles were Lady Castlemaine and Louise de Querouaille, the latter of whom apparently was sent to keep the king under the political influence of France. The queen, especially because she bore no children, was much neglected.

James II, although his temperament was not so gay as that of Charles, and he took his pleasures more seriously, also had several mistresses. He was strongly attracted to Catharine Sedley, daughter of the famous rake, Sir Charles Sedley.

During these two reigns, the lower middle classes of England had not renounced their old Puritanism. When this began to decline, it was powerfully revived by John Wesley (1703-1791), the founder of Methodism. Toward the end of Wesley's life, as we have seen, some of the temporary results of the Industrial Revolution were beginning to stimulate prostitution. Perhaps Methodism has done more for hypocritical prudery than for the advancement of public morals. The revival meeting has done

as much as the saloon, no doubt, to intoxicate and excite young people.

Robert Burns, who was only too familiar with strict Scotch Presbyterianism, describes a prayer meeting in "The Holy Fair." When all is over,

There's some are fou o' lové divine;
There's some are fou o' brandy;
An mony jobs that day begin,
May end in houghmagandie
Some ither day.

Puritanism gradually invaded the highest circles of English society. George III seems to have believed in domestic virtue, although his sons certainly did not. George IV had a large number of mistresses. It was Victoria who gave her definite approval to chastity and frowned upon the idea that under voluminous skirts there might still be legs. Respectability, the chief god of middle class England, came to dwell for a time in royal courts.

Of course this does not mean that prostitution was stamped out in Victorian England. It means simply that ladies pretended not to know that there were such things as street-walkers. Sometimes they really did not know, and then they were likely to prove easy victims to a clever procuress.

Sanger, writing of conditions in the middle of the nineteenth century, says:

It is said that women even attend regularly at churches and Sunday-schools for the purpose of decoying female children. . . They have been known to take the children away in the presence of the teacher, who, seeing them act as acquaintances, had no suspicion of the real nature of their associations.

Although streetwalking was illegal at this time, it was usually tolerated. Sanger estimates that there were in London in 1858 about five thousand brothels and houses of rendezvous. Some of the houses used for such purposes belonged to the chapter of Westminster Abbey and to other churches. Many of the most prudish ladies of England lived on the rent of tenements occupied by cheap prostitutes.

PROSTITUTION IN THE GERMAN STATES, 1500-1850

As we have seen, the rise of Lutheranism brought about repressive laws against the brothels in the sixteenth century, in both the Protestant and the Catholic parts of the Holy Roman Empire. All acts of extramarital sexual intercourse were condemned in several imperial orders. These seem to have been aimed especially against priests' concubines. An edict of the Emperor Charles V, dated 1533, threatened bawds with flogging, cutting off of the ears, banishment, and other penalties. Many of the cities and states of Germany passed ordinances to the same general effect. After a short time, the brothels were openly re-established. If neighbors objected, however, they could usually count upon the police to enforce the abolitionistic laws.

In the seventeenth century, Hamburg and some other German cities established work-houses where prostitutes, especially those who had committed some breach of the peace, were

confined. Formerly they had been sent out of the city, flogged, or made to stand in the pillory. In the workhouses the women were sometimes kept for long periods of time, made to spin or perform other labors, and severely disciplined. Yet prostitution by no means disappeared. In Hamburg the harlots seem for a time to have worked hand in hand with the police, notifying the authorities when a traveler had come into a brothel and receiving part of the fine which was imposed upon him.

In Frankfurt, during the seventeenth century, prostitutes were exposed in cages or upon wooden horses. In Vienna a cage was also erected. Public whipping was a common penalty. Probably the punishments which were intended to put harlots to shame did more to attract patrons to them than to discourage them from their profession. More than this, some women who had committed occasional acts of fornication or adultery and who were pilloried or caged were thus driven out of decent society and into the company of bawds and prostitutes.

Prostitution in Germany was greatly stimulated by the French Revolution. The fugitive nobles belonged to the class which best supported the bawds and courtesans of Paris. Abroad they continued as best they could to live their old lives. Very soon after they had come to Coblenz, we are told, no virgins over the age of twelve were to be found in the city. Every tavern in town became a brothel. Women flocked in from the country and from distant cities to share in the money which the

French nobles were flinging away. The Rhine towns all became infected with syphilis, which was called "the emigrants' gallantry."

Those of the *émigrés* who had brought little or no money with them in their flight were disinclined to hard labor. Many of them became pimps or bullies, living on the earnings of harlots who admired their manners and their fine speech.

In Hamburg, the Frenchmen introduced refinements never before practiced in the brothels. According to a contemporary writer, "Our drinking shops became pavilions, our cellars became halls, our girls became young ladies; in short, we were thoroughly polished by the immoral horde of emigrants. The crowd strode quickly and without restraint over our pleasant streets, and modesty and respectability fled with averted faces, while the few good men sorrowed."

The "young ladies" fitted up their brothels and apartments with luxurious furniture, hoping thus to attract the richest and most generous patrons. Prostitutes of the first grade ordinarily received a louis d'or, amounting to at least ten dollars of our money. Such fees had previously been unknown in Hamburg.

Meanwhile the laws against prostitution had not been repealed, and the noisier or unluckier harlots were frequently punished. But it seemed that women were unable to resist French gallantry. First servants and waitresses, then honest shopkeepers' daughters, then the wives of the citizens, were seduced.

In 1807, prostitution was officially recognized by the authorities of Hamburg. Harlots were taxed and required to register with the police and undergo regular physical examinations. The money brought in by the taxes, above that required to enforce the ordinance, went to the municipal hospital.

In 1834, Hudtwalcker, director of police in Hamburg, issued the regulations known as the "Blue Book." He made it plain that prostitution was "only tolerated, but not permitted or even authorized or approved." This proviso amounted to little more than a play on words, however. The important fact was that the police agreed not to molest prostitutes or keepers of brothels who conformed to the rules.

Every harlot, whether living in a brothel or privately, was required to be enrolled upon the police register. Every house serving the purposes of prostitution had to contain at least one registered woman. This regulation enabled the police to control houses of rendezvous, the landlords of which might otherwise have contended that they were not brothels within the meaning of the ordinance. Kept mistresses were required to be registered, but they did not need to submit to the regular medical examinations unless they actually had relations with several men. Girls under twenty who had not previously engaged in prostitution were to be discouraged from registering unless they had previously been seduced and knew no other way of supporting themselves. When possible, the consent of their parents was to be obtained.

No woman under the age of twenty-five not enrolled as a prostitute was to live in a brothel as a servant or relative of the master or mistress. No children over the age of ten years were to live in any brothel. Solicitation upon the street was forbidden, and no prostitute was to go out after eleven o'clock at night without a male companion, or to walk in certain specified parts of the city. Men under the age of twenty were not to be permitted to enter brothels. No music or gaming was permitted in brothels, and a special license was required for the sale of food and drink. Riotous conduct, blackmailing, and acts of violence against the patrons or the prostitutes were forbidden. No woman who wished to leave a brothel was in any way to be restrained. No woman who was venereally diseased was to cohabit with any man, nor was any prostitute to permit any man whom she believed to be infected to have congress with her. At least once a week, each enrolled prostitute was medically examined. Fines, loss of the right to maintain a brothel, imprisonment on bread and water or with hard labor, were among the penalties imposed for violation of these orders.

Hudtwalcker's regulations have been considered thus at length because they are very much like the rules adopted in many parts of Europe in the nineteenth and twentieth centuries. The thought that prostitution cannot be eradicated and therefore should be controlled by the police for the avoidance of scandal and the control of disease has inspired

most of the Continental laws and ordinances dealing with prostitution since 1800.

From the police rolls of Hamburg in the 1840's, it appears that there were about twice as many harlots living in the brothels as there were in private houses. Of the latter, however, undoubtedly a great many remained unregistered.

In Prussia, prostitution was tolerated by law after 1700 as a necessary evil. Fortnightly medical examinations were required. In 1792, a new code of regulations was issued. Prostitutes were forbidden to use rouge or to wear distinctive clothing. Women who wished for the first time to engage in prostitution had to register their names with the police. Prostitutes were instructed by physicians regarding the symptoms of the venereal diseases, that they might recognize it in themselves or in prospective patrons. Bawds, male and female, were sent to the house of correction. The maximum punishment consisted of three years' imprisonment, with a whipping upon admission and before discharge. Parents and teachers who prostituted girls in their charge were liable to six years in the workhouse. Brothels were to be permitted only in large cities. Men who came into the public houses when they were diseased were liable to the women whom they infected in intercourse for the cost of treatment and were also subject to criminal prosecution leading to a fine and imprisonment.

In the year 1808, there were in Berlin fifty brothels containing 230 women and there were

203 private prostitutes registered with the police. In addition, there were known to be 400 illicit prostitutes. At this time, the population of the city was perhaps 150,000.

In 1814, there was much agitation in Berlin for the closing of the brothels. The officials of Breslau, where the houses had been closed since 1812, reported that illicit prostitution and probably syphilis as well had much increased. Nothing was done at this time in Berlin. In 1840, brothels on some of the busy streets were required to remove to a place called the Koenigsmauer. From 1845 to 1851 the brothels of Berlin were closed. The result was that syphilis and sexual crimes of all sorts vastly increased. Prostitution was then recognized by the police as legal, and they resumed their old control.

By the middle of the nineteenth century, most of Europe had come to tolerate prostitution and to place it under the control of the police and sanitary authorities. There was much opposition to such toleration, but practically all authorities on public health and safety considered it to be necessary. Even where the laws forbade prostitution, the police were little inclined to enforce them. Where repressive laws had been enacted, they had failed of their purpose.

FOREWORD.

John Brown's life is a grand, simple epic that should inspire one to heroism. No one asks for dates and minute details on hearing the life of Jesus or Socrates. There are men who have proved their superiority to the pettiness of life, and who seem almost divine. John Brown is one of them. I think he was almost our greatest American. I know that he was the greatest man the common people of America have yet produced.

He did not become a President, a financier, a great scientist or artist; he was a plain and rather obscure farmer until his death. That is his greatness. He had no great offices, no recognition or applause of multitudes to spur him on, to feed his vanity and self-righteousness. He did his duty in silence; he was an outlaw. Only after he had been hung like a common murderer, and only after the Civil War had come to fulfill his prophecies, was he recognized as a great figure.

But in his life he was a common man to the end, a hard-working, honest, Puritan farmer with a large family, a man worried with the details of poverty, and obscure as ourselves. Now we are taught as school-children that only those who become Presidents and captains of finance are the successful ones in our democracy. John Brown proved that there is another form of success, within the reach of everyone, and that is to devote one's life to a great and pure cause.

John Brown was hung as an outlaw; but he was a success, as Jesus and Socrates were suc-

cesses. Some day school-children will be taught that his had been the only sort of success worth striving for in his time. The rest was dross; the personal success of the beetle that rolls itself a huger ball of dung than its fellow-beetles, and exults over it.

John Brown is a legend; but I still see him in the simple, obscure heroes who fight for freedom today in America. That is why I am telling his story. It is the story of thousands of men living in America now, did we but know it. John Brown is still in prison in America; yes, and he has been hung and shot down a hundred times since his first death. For his soul is marching on; it is the soul of liberty and justice, which cannot die, or be suppressed.

LIFE OF JOHN BROWN

WHEN SLAVERY WAS RESPECTABLE

To understand any of the outstanding men of history one must also understand something of their background. The Roman Emperor Marcus Aurelius persecuted and burned the primitive Christians; yet he is accounted one of the most religious and humane of historical figures, and his *Meditations* are commonly considered a book of the gentlest and wisest counsel toward the good life.

You cannot understand this paradox unless you know the history of the Roman state. And you cannot understand John Brown unless you understand the history of his times.

John Brown, until the age of fifty, had lived the peaceful, laborious life of a Yankee farmer with a large family. He hated war, and was almost a Quaker; had never handled fire-arms, and was a man of deep and silent affections. He was deeply religious, read the Bible daily; Christianity imbued all the acts of his daily existence.

This man, nearing his sixtieth year, assembled a group of young men with rifles and took the field to wage guerrilla war on slavery. He became a warrior, an outlaw. What drove him to this desperate stand?

I think the answer is: Respectability. There is nothing more maddening to a man of deep moral feeling than to find that slavery has become respectable, while freedom is considered the mad dream of a fanatic.

The slavery of black men had become the most respectable institution in America in John Brown's time. It had had a dark and bloody history of a hundred years in which to become firmly rooted into American life.

There had been slavery in Europe for centuries before the discovery of America—but it was white slavery. Each feudal baron owned hordes of serfs—white farmers—who were as much a part of his land-holdings as his castles, horses and ploughs.

With the invention of printing, gunpowder and machine production the system of feudalism declined. The French Revolution helped deal it a death blow. The last country where this ancient slavery of white men was not dead was in Russia; but African slavery, the slavery of Negroes, who were heathens, and therefore could morally be bought and sold by Christians, had been reintroduced on the northern coast of the Mediterranean by Moorish traders. In the year 990 these Moors from the Barbary Coast first reached the cities of Nigrita, and established an uninterrupted exchange of Saracen and European luxuries for black slaves.

Columbus tried to introduce Indian slavery into Europe but the church forbade it, for Indians were accounted Christians when converted. The unhappy Negroes were not considered convertible; their slavery was sanctified by the church. And for the next few centuries the African slave-trade was the most lucrative traffic pursued by mankind. Black slaves were to be found in the whole vast area of Spanish and Portuguese America, also in Dutch and French Guinea and the West Indies. It was black men who cleared the jungles, tilled the fields, built the cities and roads and laid down, in their sweat and blood, the foundations of civilization in the New World. Great

jealous and prosperous monopolies were formed in this traffic of slaves; and its profits were greedily shared by philosophers, statesmen and kings.

In 1776, the American colonies were inhabited by two and a half million white persons, who owned half a million slaves. Many of the most rational and humane leaders of the Revolution saw the inconsistency of slave-holders making a revolution in the name of freedom. There was some early agitation against slavery, but the humanitarians were in a minority. Even then slavery had become respectable and profitable. It would have been easy and cheap to have freed the slaves then. It would have been the most practicable thing the young nation could have done. Not a life would have been lost; and the development of the country might have been even more rapid. But it was not done; such acts need more far-sightedness than the average man possesses.

Slavery grew by leaps and bounds, as the country was growing.

The slave trader, shrewd, intelligent and rich, kidnapped young men and women in Africa and did a huge business. His markets became the feature of every Southern town. The planters lolled at their ease, and devised ways and means of forcing their slaves to breed more rapidly. The slaves were treated as impersonally as animals. Mothers were sold away from their children, and husbands from their wives. Generations of black men died in bondage, and left their children only the sad inheritance of slavery.

The South developed an aristocrat class of indolent white men and women who looked down on all work as ignominious, and who used their minds, not in the arts or sciences, but to find new moral justifications for slavery.

Slavery was respectable. "It is an act of philanthropy to keep the Negro here, as we keep our children in subjection for their own good," said a Southern statesman. Slavery was moral. Even most of the respectability of the North enlisted in its defense. In 1826, Edward Everett, the great Massachusetts statesman, said in Congress that slavery was sanctioned by religion and by the United States Constitution.

The churches of almost every denomination were solidly behind slavery. The Supreme Court ruled that it was constitutional. A pro-slavery President occupied the White House, and Senator Sumner, a lonely abolitionist, was beaten down with a loaded cane on the senate floor because he dared say a brave word against the nation's crime.

In 1838 William Lloyd Garrison founded the *Liberator*, first of the abolitionist journals. He said that "the constitution is a covenant with death, and an agreement with hell," and he fought slavery with all his power. "Our country is the world, our countrymen all mankind," was the slogan of his journal. Garrison was beaten by a mob in a northern city for his courage; and other abolitionists were tarred and feathered, lynched, and attacked by mobs of respectable northern merchants and churchgoers, much as pacifists were beaten by mobs during the late war.

Slavery was respectable. Negro field hands sold for \$1,000 each, and innocent black babies were worth \$100 each to the white master as they suckled at a Negro mother's breast.

To attack slavery was to attack the constitution, the church, the government, and the institution of private property. To attack respectability has always been the crime of the saviours, and respectability is the cross on which they are forever hung.

HOW JOHN BROWN BECAME AN ABOLITIONIST

In the pagan ages and in the more distant days of savagery, men were individuals. They had no social imagination. They could stand by and see another man writhe in tortures, and laugh at him. Civilization has been developing social imagination; it has been breeding more and more the type of human being who feels the suffering and injustice of another as his own.

John Brown was perhaps born with this strain in him. In 1857, when he had already plunged into his life-work, and was in the thick of bloody fights in Kansas, he sat down to write a most charming and tender letter to a little boy who was the son of one of his friends in the east. Those who think of fighters like John Brown as possessed by only a lust for battle, ought to read this letter. It reveals how soft was his heart under the grim mask of the Kansas warrior.

The letter is autobiographical. It tells how John Brown first became acquainted with the horrors of slavery, and what effect it had on his imagination.

This letter is so touching, and so remarkable for the picture it gives of John Brown's early years, also for the picture of the man's mature character as revealed by his own words, that I am tempted to give it in full. I shall give only parts of it, however.

THE LETTER TO MASTER HENRY L. STEARNS

"My dear Young Friend:—I had not forgotten my promise to write you; but my constant care and anxiety have obliged me to put it off a

long time. I do not flatter myself I can write anything that will very much interest you; but have concluded to send you a short story of a certain boy of my acquaintance; and for convenience and shortness of name, I will call him John.

"This story will be mainly a narration of follies and errors, which I hope you may avoid; but there is one thing connected with it, which will be calculated to encourage any young person to persevering effort, and that is the degree of success in accomplishing his objects which to a great extent marked the course of this boy throughout my entire acquaintance with him; notwithstanding his moderate capacity, and still more moderate acquirements.

"John was born May 9, 1800, at Torrington, Connecticut; of poor and hard-working parents; a descendant on the side of his father of one of the company of the Mayflower who landed at Plymouth, 1620. His mother was descended from a man who came at an early period to New England from Amsterdam, in Holland. Both his father's and his mother's fathers served in the war of the revolution; his father's father died in a barn at New York while in the service, in 1776.

"I cannot tell you of anything in the first four years of John's life worth mentioning save that at an early age he was tempted by three large brass pins belonging to a girl who lived in the family; and stole them. In this he was detected by his mother; and after having a full day to think of the wrong, received from her a thorough whipping.

"When he was five years old his father moved to Ohio, then a wilderness filled with wild beasts and Indians. During the long journey which was performed in part or mostly with an ox-team, he was called on by turns to assist

a boy five years older, and learned to think he could accomplish smart things in driving the cows and riding the horses. Sometimes he met with rattlesnakes which were very large, and which some of the company generally managed to kill.

"After getting to Ohio he was for some time rather afraid of the Indians, and of their rifles; but this soon wore off, and he used to hang about them quite as much as was consistent with good manners, and learned a trifle of their talk. His father at this time learned to dress deer skin, and John, who was perhaps rather observing, ever after remembered the entire process of deer skin dressing, so that he could at any time dress his own leather such as squirrel, raccoon, cat, wolf or dog skins; and also he learned to make whip lashes, which brought him in some change at various times, and was useful in many ways.

"At six years old John began to be quite a rambler in the new wild country, finding birds and squirrels, and sometimes a wild turkey's nest. Once a poor Indian boy gave him a yellow marble, the first he had ever seen. This he thought a good deal of, and kept it a good while; but at last he lost it one day. It took years to heal the wound, and I think he cried at times about it. About five months after this he caught a young squirrel, tearing off its tail in doing it; and getting severely bitten at the same time himself. He however held on to the little bob-tailed squirrel and finally got him perfectly tamed, so that he almost idolized his pet. This, too, he lost, by its wandering away; and for a year or two John was in mourning; and looking at all the squirrels he could see to try and discover Bobtail, if possible. He had also at one time become the owner of a little ewe lamb which did finely until it was about two-thirds grown, when it

sickened and died. This brought another protracted mourning season; not that he felt the pecuniary loss so heavily, for that was never his disposition; but so strong and earnest were his attachments. It was a school of adversity for John; you may laugh at all this, but they were sore trials to him.

"John was never quarrelsome; but was excessively fond of the roughest and hardest kind of play; and could never get enough of it. He would always choose to stay at home and work hard, rather than go to school. To be sent off alone through the wilderness to very considerable distances was particularly his delight; and in this he was often indulged; so that by the time he was twelve years old he was sent off more than a hundred miles with companies of cattle; and he would have thought his character much injured had he been obliged to be helped in such a job. This was a boyish feeling, but characteristic, nevertheless.

"When the war broke out with England in 1812 his father soon commenced furnishing the troops with beef cattle, the collection and driving of which afforded John some opportunity for the chase, on foot, of wild steers and other cattle through the woods. During this war he had some chance to form his own boyish judgment of men and measures; and the effect of what he saw was to so far disgust him with military affairs that he would neither train nor drill, but got off by paying fines; and got along like a Quaker until his age had finally cleared him of military duty.

"During the war with England a circumstance occurred that in the end made him a most determined Abolitionist and led him to swear eternal war with slavery. John was stopping for a short time with a very gentlemanly landlord, since made a United States Marshal. This

man owned a slave boy near John's age, a boy very active, intelligent and full of good feeling to whom John was under considerable obligation for numerous little acts of kindness.

"The Master made a great pet of John; brought him to table with his finest company and friends and called their attention to every little smart thing he said or did, and to the fact of his being more than a hundred miles from home with a company of cattle alone; while the Negro boy (who was fully if not more than his equal) was badly clothed, poorly fed and lodged in cold weather, and beaten before John's eyes with iron shovels or any other thing that came first to hand.

"This brought John to reflect on the wretched, hopeless condition of fatherless and motherless slave children; for such children have neither fathers or mothers to protect and provide for them.

"He sometimes would raise the question in his mind: Is God, then, their father?"

HOW JOHN BROWN EDUCATED HIMSELF

There are other matters treated in this long and charming letter, written by an outlaw 57 years old, to a boy of twelve. One detail that is important is the analysis of his own character. John Brown says his father early made him a sort of foreman in his tanning establishment, and that though he got on in the most friendly way with everyone, "the habit so early formed of being obeyed rendered him in after life too much disposed to speak in an imperious or dictating way." John Brown was ever humble, and severely chastised his own faults, but

this habit of being a leader served him in good stead, and made him the born captain of forlorn hopes he later became.

Another detail that interests us is his account of his early reading. Working-class Americans, and they are the majority of the nation, do not go to the high schools and universities. Neither did John Brown. But they can read history, as he did at ten years, and they can study and make themselves proficient in some field, as he made a surveyor of himself by home study. He also read passionately, he says, the lives of great, good and wise men; their sayings and writings; the school of biography that seems to have nurtured so many great men. John Brown never went to school after his childhood; but he became an expert surveyor, he learned the fine points of cattle breeding and tanning, he was a student of astronomy, he knew the Bible almost by heart, he studied military tactics later in life, he was familiar with the lives and times of most of the great leaders of mankind, and best of all, he knew how to stir men to great deeds, and lead them in the battle.

Great men do not need to own a college diploma; they teach themselves, they are taught by Life.

How meaningless college degrees would sound if attached after the names of Brutus, Pericles, Socrates, Caius Gracchus, Buddha, Jesus, Wat Tyler, Jefferson, Danton, William Lloyd Garrison!

As for instance: Jesus Christ, D.D.; Robert Burns, M.A.; Victor Hugo, B.S.; John Brown, Ph.D.! How superfluous the titles of man's universities, when Life has crowned the student with real and greener laurels! Yes, there are many things not taught in the colleges!

THE MOULDING OF JOHN BROWN

And so by his own pen, we have had illuminated for us the life of John Brown up to his twentieth year. We see him, a big, strong boy, fond of hard work, capable in all he put his hand to, a young man bred in the hard college of life in an early pioneer settlement. He was fond of reading good books, and improving his mind; he was rather shy, and yet filled with an extraordinary self-confidence, which made him a born leader, one who could show the way to men older than himself, and command them, and himself, in the straight line of duty.

The subsequent life of John Brown cannot be understood unless one knows all the environmental forces and the heredity that went to mould him. John Brown, a Puritan in the austerity of his manner of living, the narrow yet burning reality of his vision, and the hardships he later underwent, came of a family of American pioneers. To John Brown life from the outset meant incessant strife, first against unconquered nature, then in the struggle for a living, and finally in that effort to be a Samson to the pro-slavery Philistines in which his existence culminated.

At twenty John Brown married Dianthe Lusk, a plain but quiet and amiable girl, as deeply religious as her young husband, and as ready as he to assume all the serious burdens of life.

He was working in his father's tanning establishment at this time, at Hudson, Ohio. But in May, 1825, John Brown moved his family to Richmond, near Meadville, Pennsylvania, the first of his many moves for he was imbued with a deep restlessness, the hunger of the pioneer for virgin lands and new enterprises.

Here, with his characteristic energy, he cleared twenty-five acres of timber land, built

a fine tannery, sunk vats, and in a few months had leather tanning in all of them. Like his father, Owen Brown, John was of a marked ethical and social nature. He proved of great value to the new settlement at Richmond by his devotion to the cause of religion and civil order. He surveyed new roads, was instrumental in building school houses, procuring preachers, "and encouraging anything that would have a moral tendency." It became almost a proverb in Richmond, so an early neighbor records, to say of a progressive man that he was "as enterprising and honest as John Brown, and as useful to the county."

In Richmond the family dwelt for ten years. John Brown raised corn, did his tanning, brought the first blooded stock into the county, and became the first postmaster. Here, also, at Richmond, the first great grief came into John Brown's life, to school him in that stoicism that later made him the hero of a great cause. A four year old son died in 1831, and the next year his wife, Dianthe, died after having lived and worked beside him like a good, faithful woman for twelve years, giving birth to seven children in that time, five of whom grew to vigorous manhood and womanhood.

Nearly a year later John Brown was married for the second time, to Mary Anne Day, daughter of a blacksmith. She was then a large, silent girl of sixteen, who had come to John Brown's home with an older sister to care for his children after his wife's death. He quickly grew fond of the young pioneer girl; one day he gave her a letter offering marriage. She was so overcome that she dared not read it. Next morning she found courage to do so, and when she went down to the spring for water for the house, he followed her and she gave him her answer there.

Mary Brown was the best wife a John Brown

could have found. She had great physical ruggedness, and she bore for her husband thirteen children, seven of whom died in childhood, and two of whom were killed in early manhood at Harper's Ferry. She did more than her full share of the arduous labor of a large pioneer household, and she endured hardships like a Spartan mother. She was strong; and she had a noble and unflinching character. It was only a heroic woman such as this who could have been the wife of a hero; who could have given husband and sons cheerfully to the cause of abolition, and been so silent and brave even after their death.

John Brown worked hard; he had no vices, he was honest and painstaking, but somehow success in business always eluded him. This was another of the griefs of his life. He blamed himself for his failures, but it was really not his fault. It requires a real worship of money to make one a business success, and John Brown never took money as seriously as it demands of its lovers. After ten years in Pennsylvania, of much hard work with little results, he moved to Franklin Mills, in Ohio, where he entered the tanning business with Zenas Kent, a well-to-do business man of that town. Here he also became involved in a land development scheme that was ruined by a large corporation's maneuvers. He was so deeply involved in this and other ventures that in the bad times of 1837 he failed. In 1842 he was again compelled to go through bankruptcy proceedings.

In after years John Brown explained these failures to his oldest son as the result of the false doctrine of doing business on credit.

"Instead of being thoroughly imbued with the doctrine of pay as you go," he wrote, "I started out in life with the idea that nothing could be done without capital, and that a poor man must use his credit and borrow; and this pernicious

doctrine has been the rock on which I, as well as many others, have split. The practical effect of this false doctrine has been to keep me like a toad under a harrow most of my business life. Running into debt includes so much evil that I hope all my children will shun it as they would a pestilence."

John Brown never gave up in despair anything he had attempted; his business failures bruised him sorely, but he arose each time like a rugged wrestler and began a new endeavor. In 1839, at one of his darkest periods, he began a sheep growing and wool marketing venture in which he engaged for many years, going into partnership with Simon Perkins, a wealthy merchant of Akron, Ohio. This partnership was the longest and final one of Brown's business career.

So that is how one must think of Brown, too; not only as the consecrated, almost inhuman battler and martyr, but also as the sane, plodding, patient farmer, tanner, surveyor, real estate speculator, and practical shepherd. He was a tall, spare, silent man, terribly plous, terribly honest, a good neighbor and community leader, and the father of a large family of sons and daughters—a patriarch out of the Bible, tending his flocks and gathering about him a tribe of young and stalwart sons.

He was a typical pioneer American of those rough days in the settling of the middle west. He had no time for frivolity, though there was a grim humor in the man; he brought his children up strictly, yet with a justice that made them all love, revere and respect him until the end; and he had his share of those private sorrows that crush so many men; his first beloved wife had died, with an infant son; he had failed in business; and he had lost by death no less than nine children, three of whom perished in one month in those hard

surroundings, and one of whom, a little daughter, was accidentally scalded to death by an elder sister. These deaths hurt John Brown cruelly, for though stern and stoic, he was a fiercely tender father; all his affections were fierce, though inexpressible and deep, as a lion's.

"I seem to be struck almost dumb by the dreadful news," he wrote his family, when he heard of this accident. "One more dear little feeble child I am to meet no more till the dead, small and great, shall stand before God. I trust that none of you will feel disposed to cast an unreasonable blame on my dear Ruth on account of the dreadful trial we are called to suffer. This is a bitter cup indeed; but blessed be God; a brighter day shall dawn; and let us not sorrow as they who have no hope."

The Browns had made at least ten moves in the years from 1830 to 1845, and John Brown had engaged in no less than seven different occupations. But always, under the business man and farmer, there had been the solemn philosopher brooding on God and the mystery and terror of life; and always, under the sober father and citizen, there had been planning and brooding and suffering keenly the tender humanitarian, the Christ-like martyr, the relentless fighter who would finally pay with his life to strike a blow at Slavery, "that sum of all villainies."

In this patriarchal farmer of the middle west, Freedom was forging and sharpening a terrible weapon that was some day to be turned against Tyranny. Quietly, in peaceful surroundings the work was being done; no one knew the fire in this man, least of all himself.

THE GROWTH OF AN ABOLITIONIST

For though John Brown had always been an abolitionist, though he had learned from his father, and from his own experiences to hate slavery and its manifold brutalities, it was not until his thirty-fifth year that John Brown showed any more active hatred of it than did hundreds of Ohio farmers around him. Like them, he aided when he could, in the work of the Underground Railroad. Thousands of free Negroes and white abolitionists were engaged in this work of passing fugitive slaves from the South up over the Canadian line, where they were being restored to manhood under the flag of monarchism.

But John Brown, in 1834, began thinking that education of the Negroes might be an important way toward the solution of their problems. He formed plans of starting a school for them. He and his family at this time, though his wool-business was going comfortably, lived in extreme frugality, for they had agreed to save all they could toward the establishment of some such school. For years John Brown dreamed of such ventures as these; and he read all the journals of the small abolitionist groups, and met many of the leaders. He always spoke against slavery in churches or political meetings where he happened to be; and he made friends with many Negroes, and showed a deep interest in all their problems. But not yet had he formed any of those belligerent plans that later were his whole life. He still believed that abolition might be effected by education and peaceful agitation.

Events were piling up too rapidly against such a view, however. The South grew more aggressive every day. The slave system seemed to carry everything before it. It had broken

the agreement of 1820 by extending slavery above the Mason and Dixon line into Missouri. It had forced the war against Mexico, and had carved out huge new tracts for slavery. It dominated the government of the United States. All of the Presidents were pro-slavery, or they could not hope for office. Congress was pro-slavery, and the Senate, too.

And it was not only in the South that the life of an abolitionist was worth little more than a pinch of snuff. The slavery venom had crept into the North, for powerful economic reasons. The Northern merchants and manufacturers made their profits by selling machinery, and the goods made by machinery, to the agricultural, cotton-raising South. And the South threatened to secede from the union, or at the least, to force a low tariff on imports, and buy its goods in Europe, if the abolitionists were not curbed.

There were not many of these abolitionists; but they were outspoken, intense, and made themselves heard at all costs. They paid a heavy price for this courage. They were persecuted, tarred and feathered, and in many cases lynched by the Northern mobs.

Then the Southern slave system seemed to have reached a triumphant climax in two events: the first, the passing of the Fugitive Slave Law, in 1851, and the other, the battle over the admission of Kansas as free soil or slave territory.

The fugitive slave law incensed John Brown to fury, as it did every other abolitionist. It was a federal law forced by the South which forced the state officials of every Northern state, however much they might hate slavery, to join in the hunt for runaway slaves and their helpers.

A United States sloop was sent to bring back

a slave who had fled to Boston. The abolitionists tried to rescue him, but were foiled, with two men killed. Scenes such as these marked, everywhere in the North, the enforcement of the law. Abolitionists were arrested in communities where everyone of their neighbors was also anti-slavery. Slaves, who had been freemen for years and years in the North, were captured and dragged back to bondage by government officials.

The abolitionists became more fiery in their desperation. Many of them, like Garrison, began preaching that the North set up a government of its own: "No Union With Slaveholders!" was the slogan,

And the Kansas affair heaped coal on this fire. Under the Missouri Compromise, both North and South had agreed to restrict slavery within the states already burdened with it; they had agreed also, that the citizens of a new territory could decide whether or not they wanted slavery or freedom, and could vote their choice when the territory was admitted to the union. In other words, both sides would keep their hands off new territory; and the federal government would not interfere.

Kansas was such a territory; it was being rapidly settled, and in a few years was to come up for admission as a state.

And what was happening was that the South was flooding this territory with spurious settlers; idle, whiskey-drinking ruffians armed with shotguns and revolvers, who were intimidating the Northern settlers who had come, and were stealing the elections from them, by force of arms.

The South was openly breaking its agreement with the north; it was openly declaring its intent to make Kansas another addition to the slave states.

To the abolitionists in the North this seemed like the last straw. The South was at its flood-tide of domination; it controlled everything in the American union; and now it was moving forward to make its domination permanent by any means; even by the means of murder and intimidation.

Reports of assassinations, whippings, and the burning down of Northern settlers' cabins came every week from Kansas. The abolitionists began raising emigrant companies of Northerners who would go to Kansas to vote for freedom, even though the South sent its cannon against them.

The Brown family had by now moved to North Elba, New York, a little Adirondack colony of fugitive Negroes who had settled on the lands owned by Gerrit Smith, a wealthy and sincere abolitionist. John Brown had been of much practical service to the Negroes there; but he and his sons, like every other foe of slavery, were deeply shaken by the events in Kansas.

It seemed horrible to everyone, that after twenty years of bitter agitation, slavery was not waning, but was stronger than ever—indeed, was threatening to swallow up even the North.

Strong men were needed in Kansas; and so John Brown's sons went there. They were men of peace; they went there as bona fide settlers, to take up claims, and to cast their vote, when the time came, for freedom. But in two months they were writing letters to North Elba asking their father to send them all the rifles he could collect.

"We have seen some of the curses of slavery, and they are many," wrote one of the sons in the very first letter home. "The boys have all their feelings worked up, and are ready to

fight. Send us arms; we need them more than we do bread."

John Brown collected the arms; and what was more, he delivered them with his own hands. He wound up his business affairs, left his strong, patient wife in charge of the North Elba farm, and went to join his sons in Kansas. The curtain was now rising in the first act of the universal drama called John Brown. The man of God, the tender friend of little slave children, and old, tortured slave mammies, the man of the plough and the counter, the patriarch and citizen was at last ready to become Captain John Brown of Osawotamie; John Brown, the outlaw, the warrior, the soldier of freedom.

At the mere mention of his name Border Ruffians and swashbuckling adherents of slavery were soon to tremble and even fly, as though a devil were behind. And he was bowed with cares and rapidly turning gray; and he had never handled fire-arms; and he was at the age when other men begin to talk of retiring from business and life, when they long for peace and reflection, in some quiet country scene, away from the world and its problems.

He was fifty-five years old.

THE SITUATION IN KANSAS

As John Brown left for Kansas, he turned to his wife and the remaining members of his family and said: "If it is so painful for us to part with the hope of meeting again, how must it be with the poor slaves, who have no hope?"

John Brown was always sanguine in his ventures; but the events before him would have

tried the hope of a superman; they were to be bloody, exacting, terrible. It was what he needed, however, for John Brown went to Kansas with a greater project in his mind, the attack on Virginia and the South, and Kansas was to be for him the rough, harsh school in which he could train himself for that supreme effort.

With his youngest son, Oliver, then about eighteen years old, and a son-in-law, Henry Thompson, John Brown left Chicago in August. The party had a heavily loaded wagon drawn by a "nice, stout young horse," that was stricken with distemper when they reached Missouri, and could barely drag himself along. Their progress was therefore slow; a scant seven or eight miles a day. But it gave them an opportunity to see and hear things in Missouri, then fiercely pro-slavery, and the reservoir from which were drawn most of the Border Ruffins who were raiding Kansas, and trying to force it into the phalanx of slavery states.

Companies of armed men were constantly passing and re-passing on the route to Kansas, and they were continually boasting "of what deeds of patriotism and chivalry they had performed there, and of the still more mighty deeds they were yet to do." As Brown wrote home in a letter. "No man of them would blush when telling of their cruel treading down and terrifying of defenceless Free State men; seemed to take peculiar satisfaction in telling of the fine horses and mules they had killed in their numerous expeditions against the damned Abolitionists."

John Brown was roused by all this; already he was changing from the peaceful patriarch to the fearless warrior in the field. One incident illustrates this. When the little party reached the Missouri River at Brunswick, Missouri,

they sat themselves down to wait for the ferry. There came to them an old man, frankly Missourian, frankly inquisitive after the manner of the frontier. "Where are you going?" he asked. "To Kansas," replied John Brown. "Where from?" asked the old man. "From New York," answered John Brown.

"You won't live to get there," the old Missourian said, grimly.

"We are prepared," John Brown answered, "not to die alone." Before that spirit and that eagle eye the old Missourian quailed; he turned and left.

It was in October, after an arduous trip, that John Brown and his party reached the family settlement at Osawatamie. They arrived weary and all but destitute, with about sixty cents between them. And they found the settlement in great distress; all of the Browns, except the wife of John, Jr., were completely prostrated with fever and ague, gotten from the rough conditions. They were living in a tent exposed to the chill winds, and were shivering over little fires on the bare ground. All the food left was a small supply of milk from their cows, some corn and a few potatoes. It was an unusually cold winter that year; on October 26 John Brown saw the hardest freezing he had ever witnessed south of his bleak farm-house in the Adirondacks; and all the Kansas pioneers suffered in it as did the Browns.

Nobody in Kansas that first winter knew what comforts were. While the Browns paid the penalty for living on low ground in a ravine and in tents, their bitter experience with sickness and hunger was not as bad as that of many other Northern families. Starvation and death looked in at many a door where parents lay helpless, while famished children crawled about the dirt floors crying for food, and shriek-

ing with fear if any footstep approached, lest the comer be a Border Ruffian, (as the Southerners were called) instead of a friend. For pure misery and heart-breaking suffering these pioneer tales of Kansas are not surpassed by any in the whole history of the winning of the West.

But old John Brown was indomitable; he put new life and energy into his six sons; by November two shanties were well advanced, and the food problem had been lightened. They were getting into good shape for the winter, and preparing to take up their share in the settling of Kansas, when the hot breath of war scorched all these plans, as it did many another Northern settler's.

There would be little time for growing corn for the Browns thereafter, or for the other settlers; the slavery question demanded an answer first.

One dread that had worried the Browns before leaving home proved unnecessary. It was their fear of the Indians. The Browns were terrified when the first big band of Sacs and Foxes in war-paint surrounded their tent, whooping and yelling, but they had the good sense to ground their arms, and the Indians did likewise. Thereafter both sides were great friends. John, Jr., went often to visit their old chief; once, when in the following summer, the Indians came to call again, they were "fought" with gifts of melons and green corn. "That," said Jason Brown, "was the nicest party I ever saw."

John Brown, Jr., used to ask the old chief questions, as. "Why do you Sacs and Foxes not build houses and barns like the Ottawas and the Chippewas? Why do you not have schools and churches like the Delawares and Shawnees? Why do you have no preachers and teachers?" And the chief replied in a staccato which sum-

med up wonderfully the bitter, century-long experience of his people: "We want no houses and barns. We want no schools and churches. We want no preachers and teachers. We had enough now."

No, the Indians were friends. The men really to be feared were not long in putting in their appearance. One night six or seven heavily-armed Missourians rode up to the door, and asked whether any stray cattle had been seen. The Browns replied in the negative; and then, as newcomers, they were asked, in the border slang, how they were "on the goose."

"We are Free State," was the answer, "and what is more, we are Abolitionists."

The men rode away, but from that moment the Browns were marked for destruction. They did not shrink from danger, however. They nailed their flag to the mast; armed themselves, and plunged into the thick of all the political battles then raging. In a short time their settlement was to become known as a center of fearless, and if necessary, violent resistance to all who wished to see human slavery introduced into the Territory. John Brown's life work had begun.

THE BORDER RUFFIANS HOLD AN ELECTION

No fair-minded reader of history can doubt, in glancing over the records of that time, that the South took the first bloody and brutal offensive in their attempt to force slavery on Kansas. Later, the Free State men from the north, under leaders like John Brown, General Lane and Captain James Montgomery, took up arms, too, and defended themselves bravely; but at first, they were victims of the South's determination to carry its point.

The Southerners began the attack by stealing the elections for the Territorial legislature. Thousands of Missourians, on horseback and in wagons, with guns, bowie-knives, revolvers and plenty of whisky, poured over the line in November, 1854, and encamped near the polling places. The ballot boxes were extravagantly, even humorously, stuffed; the elections were carried for the South. There was nothing concealed about the affair; in fact, the Missouri newspapers had gaily whipped up recruits for the raid.

Many of these men, Border Ruffians, as the North called them, were hired for the work. Others came for the fun; others because they hated Yankees; others because they were devout believers in Slavery.

"They wore the most savage looks and gave utterance to the most horrible imprecations and blasphemies," said Thomas Gladstone, a relative of the great statesman of that name, who was in Kansas at the time. "In groups of drunken, bellowing, blood-thirsty demons, armed to the teeth, they crowded about the bars and shouted for drink, or made the night hideous with noise on the streets."

Their fraudulent Pawnee legislature convened and passed a code of punishments for Free State men. Under the code, no one opposed to slavery in any manner could serve on a jury, or hold any office in Kansas.

Death itself was the penalty for advising slaves to rebel, or even supplying them with literature that would have that effect.

The mere voicing of a belief that slavery was illegal in Kansas was made a grave crime. Any person who said in public that slavery was wrong, or any person who even "introduced into the Territory, any book, paper, magazine, pamphlet or circular,"—saying this, was to be punished by imprisonment at hard labor for

a term of not less than five years.

This notorious Clause 12 was obviously aimed at the New York Tribune and other anti-slavery journals, and was meant to shut off every whisper of free speech. And it did not work.

For the Free State settlers would not recognize the legality of the Legislature, and held an election of their own. And so there were two legislatures in Kansas Territory, two governors and governments. All the fighting that followed centered about this dualism, and about the mad, desperate butcheries and burnings begun by the Southerners, when they saw they could not cow the Northerners into submission.

President Pierce, who was pro-slavery, sent a message to Congress in which he sided with the fraudulent legislature and its code, declaring it legal, and threatening the Free State men, whom he called traitors, insurrectionists, and seditionists against the United States government.

In all the Kansas conflict, he threw federal troops and federal politicians against the Free State men. The South rejoiced at his stand, but the Free State men went on with their work. And John Brown and his sons took a leading position in the fight.

THE SACK OF LAWRENCE

"Yet we will continue to tar and feather, drown, lynch and hang every white-livered abolitionist who dares to pollute our soil," said a flamboyant editorial in the Squatter Sovereign, a pro-slavery paper published at Atchison, Kansas, a Border Ruffian stronghold.

The Slaveryites lived up to this promise. The Free State men at this time had not begun to arm, but doggedly and quietly went about organizing their own government at Topeka.

Their actions infuriated the Southerners. Now began the long list of crimes that made the soil of Kansas reek with blood.

It would be impossible to give a full record here of all those crimes. The least that happened was the destruction of newspapers that protested against Southern injustice, such as the Parkville, Missouri, Luminary, which was burned down, the machinery thrown in the river, and the editors threatened with a similar fate if they indulged in further free speech.

There were hundreds of abolitionists murdered in Kansas; hundreds of their wives and children were giped at and threatened and terrified; hundreds of their cabins were burnt down, and thousands of head of cattle stolen.

One of the murders was the killing of Samuel Collins, owner of a saw-mill near Atchison, by Patrick Laughlin, a pro-slavery man. No effort was made to punish him by the authorities. But something was done by them in another case. Charles Dow, a young Free State man from Ohio, was cruelly shot down from behind by Franklin Coleman, a pro-slavery settler from Virginia.

What the authorities did in this case was to arrest Jacob Branson, with whom the dead man had lived. A pro-slavery sheriff charged Branson with having made threats to revenge his friend. Branson was rescued by a group of his friends with rifles, and taken to Lawrence for protection, Lawrence being entirely settled by the Free State men.

The Sheriff called on the Governor, and the Governor called on the militia, and with the aid of Missouri citizens, about twelve hundred armed men marched on Lawrence, to "put down the rebellion."

The men of Lawrence sent out a call to all Northerners; and John Brown and his men were among those who responded. There were

five hundred settlers in Lawrence, and they feverishly fortified the town with embankments; but the whole affair ended by a compromise; there was no fighting; only two men were killed in a light skirmish.

The Southerners left, weak with all the whisky they had drunk on the expedition, according to reliable observers, and angered that they had not been given the chance to burn Lawrence down.

For Lawrence was a sore spot to the pro-slavery men. It was the largest Free State town in Kansas, and the center of all the political activities of that group. It published a newspaper, and its Free State Hotel was the headquarters of the Northerner's government.

There were other murders, despite the treaty signed at this time. And then in February, as Free State men were holding another of their elections, they were assaulted at Leavenworth, and many of them forced to flee to Lawrence.

One of the leaders of the Free State men, as he was returning from Leavenworth after the election, was captured by a company of Border Ruffian militia. Wounded and defenceless though he was, they literally hacked the unfortunate foe of slavery into pieces with their hatchets and knives. Not an effort was made to punish these murderers, though their names were known by everyone. Some of the slavery journals even praised the deed, and called for more. Said the Kansas Pioneer of Kickapoo:

"Sound the bugle of war over the length and breadth of the land, and leave not an Abolitionist in the Territory to relate their treacherous and contaminating deeds. Strike your piercing rifle balls and your glittering steel to their black and poisonous hearts."

And in May of that year, after further alarms and disturbances, Sheriff Jones returned with an army of 750 "swearing, whisky-drinking ruffians," armed with rifles, and even two pieces of artillery. This time the Free State men were unprepared. John Brown was not there, nor any other real leader. The Free State men still believed in peace, and legality. And they saw their Free State Hotel go up in flames, their newspaper plant destroyed, and an orgy of drunken destruction let loose among their homes.

"Let Yankees tremble, Abolitionists fall,

Our Motto is, Give Southern Rights to All."

This was the inscription on one of the banners of the invading army. Lawrence was the first city to receive these rights. Thereafter Free State men knew what to expect; they began forming companies of riflemen and guerilla fighters to protect their communities against Southern rights.

THE LIBERTY GUARDS

One of these companies was the Liberty Guards, as commander of which John Brown first received his historic title of Captain. Besides four of Brown's stalwart sons, there were fourteen other Free State settlers in the company, and they were present at the first attempted raid on Lawrence, which had resulted in a compromise and an abortive "treaty."

Captain John Brown had gathered his men, and was on the way to Lawrence for the second time when they were informed by a messenger that Lawrence had already been destroyed. The Border Ruffians had captured the town without meeting any resistance, and had razed it

to the ground, the breathless courier reported. This startling news was received in a bitter silence by the little company. They pushed on, nevertheless, and encamped near Prairie City, hearing from passing stragglers further reports of burnings, killings and drunken threats of the Southern invaders.

It was a period of great excitement. The Kansans felt as if war had commenced in earnest on them, and that they were to be wiped out. Some of the men who lived on the Potawotamie Creek, near Dutch's Crossing, heard reports that their women had been threatened by a group of the toughest pro-slavery ruffians who lived there.

"We expect to be butchered, every Free State settler in our region," one of these men told John Brown.

Here was a story John Brown heard a few days before from the lips of a pretty young girl named Mary Grant, a settler's daughter in the region:

"Dutch Bill arrived at our house, horribly drunk, with a whisky bottle with a corncob stopper, and an immense butcher knife in his belt. Mr. Grant, my father, was sick in bed, but when they told him that Bill Sherman was coming, he had a shot gun put by his side. 'Old woman,' said the ruffian to my mother. 'you and I are pretty good friends, but damn your daughter, I'll drink her heart's blood.' My little brother Charley succeeded in cajoling the drunken man away."

An old settler named Morse was hung and let down again by this same group of ruffians. Then they threatened to kill him with an axe, but his little boys set up a terrible wailing, and begged for his life. The ruffians spared him, but gave him until sundown to leave the community. He wandered in the brush for two

or three days with his children, frightened to death, and finally died of the excitement.

There were other such tales, including one horrible story of a similar attack on a woman in childbirth. The ruffians had also put up a notice, advising every Free State settler to leave the community in thirty days or have his throat cut.

John Brown and his men discussed this matter, and grimly decided to "do something to show these barbarians we have some rights." They moved down that night on the Pottawatomie, and calling out the five men who had done most of the killing, threatening, and burning down of houses in the region, executed them as a measure of self-defense.

It was a bloody, stern act, but it proceeded out of the same inflamed spirit with which the miners at Herrin recently shot down the armed strikebreakers who had been brought into their section. Many, including some sympathetic historians like Oswald Garrison Villard, have condemned this brutal deed, and have called it a stain on John Brown's life. Murder is murder, and it cannot be defended on ethical or logical grounds. But when a thug assails one with a gun, or threatens one's wife and children, is one to practice non-resistance on him? Is his life more valuable than one's own? In such moments men do not think, they act as nature tells them to; even a Villard would refuse to yield up his life to a thug; he would forget logic and ethics, and defend himself. And that was what John Brown did; his act was a stern and immediate answer to the long-continued murders and threats against the Free State men of Kansas. It shook the Territory to its foundations, and it made of John Brown a hunted outlaw. Thereafter he grew

no more corn and built no more cabins for his family; he was a guerrilla captain in the field.

AFTER POTTAWATOMIE

John Brown, Jr., and Jason Brown, two of the fighter's sons, were captured by Missourians and suffered incredible tortures after the Pottawatomie affair. Both men were burning with fever, but they were dragged at the ends of ropes for two or three days, beaten, hung up and then let down, and then chained to ox-carts in the wind and rain. John Jr., always of a nervous temperament, went temporarily insane under this treatment, but his captors had no mercy. Though he shrieked wildly, and though his brother Jason begged that the Southerners have pity, their hearts were hard as flint.

The following scene is described by Jason:

"Captain Wood said to me: 'Keep that man still.' 'I can't keep an insane man still,' said I. 'He is no more insane than you are. If you don't keep him still, we'll do it for you.' I tried my best, but John had not a glimmer of reason and could not understand anything. He went on yelling. Three troopers came in. One struck him a terrible blow on the jaw with his fist, throwing him on his side. A second knelt on him and pounded him with his fist. The third stood off and kicked him with all his force in the back of the neck. 'Don't kill a crazy man!' cried I. 'No more crazy than you are, but we'll fetch it out of him.' After that John lay unconscious for three or four hours. We camped about one and a half miles southeast of the Adairs. There we stayed about two weeks. Then we were

ordered to move again. They drove us on foot, all the prisoners, chained two and two. At Ottawa ford young Kilbourne dropped of a sun-stroke."

The men were later released, for they had done nothing that could be prosecuted in the court where the pro-slavery government "troops" had driven them. This was the sort of thing John Brown was fighting; it was life and death, and no mercy could be expected from the Southerners. Mr. Villard and other timorous friends of John Brown do not seem to understand the nature of the battle; and they do not understand what giant faith and courage it must have taken for an old farmer of fifty-five to continue fighting in such an atmosphere.

John Brown did not flinch. Another son, Frederick, was shot down in cold blood on the steps of the family home at Osawatomie, but the old fighter, shedding a silent tear for the loss, for he deeply loved his children, went on his stern path.

The spuriously-elected slavery governor offered a reward of \$3,000 for John Brown, and the President of the United States a reward of \$250. Federal troops scoured the territory for him. For months he and his men slept out in the fields, flitting from place to place, and fighting in many battles.

With only nine men he fought off a troop of twenty-three Southerners at the "battle of Black Jack," and forced them to surrender. In August, 250 men moved on Osawatomie, to destroy it as they had destroyed Lawrence. John Brown gathered about forty men to resist the Southerners, and a hot battle was fought, in which, of course, Brown had to retreat. The town was thoroughly wiped out, and also granted "Southern rights."

There were many other skirmishes; the name of Captain John Brown, old Brown of Osawatomie, became a legend in Kansas. He became a sort of Pancho Villa figure to the South; a hundred times he was reported dead or captured; a hundred times he was blamed for wild deeds he had never done.

Here are two contemporary pictures of John Brown in the field. The first is written by August Bondi, a brave and able young Austrian Jew, who put himself under Brown's leadership after the Pottawatomie affair:

"We stayed here up to the morning of Sunday, June 1st, and during those few days I fully succeeded in understanding the exalted character of my old friend, John Brown. He exhibited at all times the most affectionate care for each of us. He also attended to the cooking. We had two meals daily, consisting of bread, baked in skillets; this was washed down with creek water, mixed with a little ginger and a spoon of molasses to each pint. Nevertheless, we kept in excellent spirits; we considered ourselves as one family, allied to one another by the consciousness that it was our duty to undergo all these privations for the good cause. We were determined to share any danger with one another, that victory or death might find us together; and we were united, as a band of brothers, by the love and affection toward the man who with tender words and wise counsel, in the depth of the wilderness of Ottawa creek, prepared a handful of young men for the work of laying the foundation of a free commonwealth.

"His words have ever remained firmly engraved in my mind. Many and various were the instructions he gave during the days of our compulsory leisure in this camp. He expressed himself to us that we should never al-

low ourselves to be tempted by any consideration to acknowledge laws and institutions to exist if our conscience and reason condemned them.

"He admonished us not to care whether a majority, no matter how large, opposed our principles and opinions. The largest majorities were sometimes only organized mobs, whose howlings never changed black to white or night into day. A minority convinced of its rights, based on moral principles, would, under a republican government, sooner or later become the majority."

The other description is that of William A. Phillips, then a correspondent of the New York Tribune, and later a Colonel in the Civil War. Brown, still an outlaw, was on his way to Topeka, to be on hand at whatever crisis might arise at the opening of the legislature elected by the Free State settlers. Phillips met him on the way.

His account is important, for it shows that John Brown saw much farther than his own times. He knew that there were many other things wrong with the social system in America besides slavery. There are plain indications here, as in other accounts, that John Brown was one of those early American Socialists, such as Horace Greeley, Albert Brisbane, father of Arthur Brisbane, Bronson Alcott, Ralph Waldo Emerson, and others, who felt that the abolition of slavery was only the first step toward a free America. Wendell Phillips, for instance, one of this abolitionist band, became after the Civil War one of the leading champions of the rights of workingmen in their battle against the capitalists.

But here is Colonel Phillips giving his charming picture, in the Atlantic Monthly for December, 1879, of that night ride and the con-

versation he had with Brown as they lay bivouacking in the open beneath the stars:

"He seemed as little disposed to sleep as I was, and we talked; or rather, he did, for I said little. I found that he was a thorough astronomer; he pointed out the different constellations and their movements. 'Now,' he said, 'it is midnight,' as he pointed to the finger marks of his great clock in the sky. The whispering of the wind in the prairies was full of voices to him, and the stars as they shone in the firmament of God seemed to inspire him. 'How admirable is the symmetry of the heavens; how grand and beautiful! Everything moves in sublime harmony in the government of God. Not so with us poor creatures. If one star is more brilliant than others, it is continually shooting in some erratic way into space.'

"He criticized both parties in Kansas. Of the pro-slavery men he said that slavery besotted everything, and made men more brutal and coarse; nor did the Free State men escape his sharp censure. He said we had many true and noble men, but too many broken down politicians from the older states, who would rather pass resolutions than act, and who criticized all who did real work.

"A professional politician, he went on, you could never trust; for even if he had convictions, he was always ready to sacrifice his principles for his advantage.

"One of the most interesting things in Captain Brown's conversation that night, and one that marked him as a thinker, was his treatment of our forms of social and political life. He thought society ought to be reorganized on a less selfish basis; for while material interests gained by competition for bread, men and women lost much by it. He condemned

the sale of land as a chattel, and thought there was an infinite number of wrongs to right before society would be what it should be, but that in our country slavery was the sum of all villainies, and its abolition the first essential work."

THE GREAT PLAN EVOLVES

Much more can be written of this Kansas period in John Brown's life; a large bibliography of Robin Hood literature has gathered about it. John Brown, and other men like him, hastened the solution of the slavery question by their firm stand in Kansas. If the South had been allowed to add Kansas to the roster of slave states, it would have crept further north, until perhaps there would have been slavery up to Canada. It is easy for any institution to become permanent; man is a creature of conventions. Slavery, like cannibalism among savages, would have in time become a matter-of-fact doctrine with all America, had not the Kansas abolitionists challenged it.

John Brown left Kansas in 1857, and made a trip through New England, gathering friends, money, arms and recruits for a new great plan that was working in his mind.

He saw that the abolitionists would be successful in making Kansas a free state. The job was already half done; but when it was completed, what next? There would still be the vast groaning empire of slavery in the South; there would still be five million black folk bought and sold like cattle; beaten, raped, murdered as if they were lower than cattle. The South would still be in the saddle at the

White House; the fugitive slave law would still be enforced; and churches, business men, newspapers, mobs, and United States troops, all would join in upholding the devil's doctrine that slavery was respectable, the law of the land.

The Abolitionists, with their few journals, were ever agitating against this infamy that was being protected by the United States flag. But John Brown knew that only a bold deed could shake the union; could make men see clearly what slavery was.

Slavery had become so firmly settled into the national life that the few thousand abolitionists only seemed like gadflies biting at the hide of a rhinoceros. John Brown saw that a pick-axe was needed to draw the blood. The pocket-books of the slave-holders must be attacked. Slavery must be sabotaged, and made unprofitable. It was such a safe and sane business now; it must be made dangerous. John Brown planned to go boldly into Virginia, with a band of men, and start there a large movement of runaway slaves. When slaves were no longer meek and submissive, when every slave became a potential runaway and rebel, slavery would cease to be a paying business. Thus reasoned John Brown.

In December, 1858, with things at last peaceful in Kansas Territory, and a Free State almost assured, John Brown made a last stirring raid into Missouri. A Negro slave named Jim Daniels had come to one of Brown's men with a pathetic tale. He and his wife and babies were to be sold at auction in a few weeks, and perhaps separated forever. He was a fine-looking, intelligent mulatto, and he wept as he told the story. John Brown and ten of his men rescued Daniels' little family and carried off to freedom eleven other slave

of the vicinity. At dawn the next day the caravan of freedom set forth on its long journey to the Northern Star—to Canada, where slaves were free. It was a perilous and arduous undertaking. The party had to sleep by stealth in barns and icy fields, with armed sentinels posted all night. The Governor of Missouri wired to Washington; money rewards were offered for Brown, armed posses were sent searching for him, the Federal troops combed the state. There were prairie snowstorms, and there were little provisions. But the old lion brought his charges through to Canada.

One incident of the trip is worth repeating. It shows what a terror the mere name of John Brown had become in Kansas.

At one place, the ford of a river, Brown's party learned there was a posse of 80 armed slavery ruffians waiting to capture him. The old man did not turn back, though he had only 22 men, black and white. He marched down on the ruffians. "They had as good a position as 80 men could wish," wrote one of Brown's men, "they could have defeated a thousand opponents, but the closer we got to the ford, the farther they got from it. We found some of their horses, for they were in such haste to fly that some of them mounted two on a saddle, and we gave chase and took three or four prisoners, whom we later released. The marshal who led them went so fast one would think he feared the fate of Lot's wife."

"Old Captain Brown is not to be taken by boys," said the Leavenworth Times, now Free State, "and he invites cordially all pro-slavery men to try their hands at arresting him."

On March 12th the slaves were safe in Canada, rejoicing in their happy fortune, after

having been brought in the dead of winter, through hostile country, some 1,100 miles in 82 days. One of the slave women had had six masters, and four of the party had served sixteen owners in all. Now they were free. And their little children were free, and would never be whipped by a Southern gentleman, or stood on the auction block like a horse or cow. The outlaw John Brown had done what was forbidden by the Supreme Court and the President of the United States; and now he was planning greater deeds.

THE EVE OF THE TRAGEDY

John Brown was now fifty-nine years old, and in the last year of his life. He had been disciplined in a terrible school in Kansas, but what he was about to attempt seemed so mad, so reckless, and so suicidally brave that many men of the South claimed, after the attempt, that he was but an insane man, and many of his conservative friends chose to take this view of the case, also.

Yet John Brown was not insane. Coolly, rationally, like a clear-headed strategist, he had figured out the situation. He was an Abolitionist, and was determined to do anything to end the brutal slave-system. Peaceful agitation had been going on for decades, but the North was still apathetic, and the South was only more inflamed and settled in its ideas.

What John Brown felt was needed now, was to make the men of the North and the South realize that there would be no peace in the land while slavery endured. What they must see was that men like himself would

rise to break that loathsome peace. He would go to the South, capture the arsenal at Harper's Ferry, in Virginia, and run off all the slaves he could find. He would take the hills about the Ferry, and with a guerrilla band move through the countryside, making slavery a shaky institution.

If he failed, he could but lose his life. He would at least stir the nation on the issue of slavery, and force men to take sides. There was too much neutrality and silence in the land on this issue, this institution that to him was a bloody crime against God and humanity. He could not fail, he felt; success or failure would achieve the same results. Events proved that he was right.

John Brown spent that winter and spring in New England, giving occasional lectures, and meeting all the leading men of the Abolition movement, who collected money for him, though he did not fully reveal his plans to anyone.

George L. Stearns, Gerrit Smith, the philanthropist, Frank B. Sanborn, the Concord schoolmaster and author; Thomas Wentworth Higginson, a brave, noble commander in the Civil War, and a charming man of letters afterward; Theodore Parker, one of the greatest and most sincere Christian clergymen produced in America; Samuel G. Howe, and others were among John Brown's supporters. Thoreau and Emerson he also met at various times, and both were passionate admirers of the stern, pure soldier of liberty.

While their Captain was gathering arms and money for the raid, some of Brown's men were quartered in a farm-house near Harper's Ferry, while others were studying the region, and mapping out routes for the attack and the retreat to the hills,

It was a cool fall night, the 16th of October, 1859, when Captain John Brown gave the command his men had been impatiently awaiting for months: "Men, get on your arms; we will proceed to the Ferry." Says Mr. Villard, at times an eloquent chronicler:

"It took but a minute to bring the horse and wagon to the door, to place in it some pikes, fagots, a sledge hammer, and a crow-bar. The men had been in readiness for hours; they had but to buckle on their arms and throw over their shoulders, like army blankets, the long gray shawls which served some for a few brief hours in lieu of overcoats, and then became their winding sheets. In a moment more, the commander-in-chief donned his old battle-worn Kansas cap, mounted the wagon, and began the solemn march through the chill night to the bridge into Harper's Ferry, nearly six miles away.

"Tremendous as the relief of action was, there was no thought of cheering or demonstration. As the eighteen men with John Brown swung down the little lane to the road from the farmhouse that had been their prison for so many weary weeks, they bade farewell to Captain Owen Brown, and Privates Barclay Coppoc and F. J. Meriam, who remained as rear-guard in charge of the arms and supplies. The brothers Coppoc read the future correctly, for they embraced and parted as men do who know they are to meet no more on earth. The damp, lonely night, too, added to the solemnity of it all, as they passed through its gloom. As if to intensify the sombreness, they met not a living soul on the road to question their purpose, or to start with fright at the sight of eighteen soldierly men coming two by two through the darkness as though risen from the grave.

"There was not a sound but the tramping of the men and the creaking of the wagon,

before which, in accordance with a general order, drawn up and carefully read to all, walked Captains Cook and Tidd, their Sharp's rifles hung from their shoulders, their commission, duly signed by John Brown, and officially sealed, in their pockets. They were detailed to destroy the telegraph wire on the Maryland side, and then on the Virginian, while Captains John H. Kagi and Aaron D. Stevens, bravest of the brave, were to take the bridge watchman and so strike the first blow for liberty. But as they and their comrades marched rapidly over the rough road, Death himself moved by their side."

THE ARSENAL IS CAPTURED

Events flashed sharp and terrible and swift as lightning after this sombre opening of the storm. The telegraph wires were cut, the watchman at the bridge captured, guards were placed at the two bridges leading out of the town, and many citizens were taken from the streets and held as prisoners in the Arsenal.

Perhaps the most distinguished prisoner was Colonel Lewis W. Washington, a great-grand-nephew of the first President, and like him, a gentleman farmer and slave-owner. He lived five miles from the Ferry, and with the instinct of a dramatist, John Brown seized him and freed his slaves as a means of impressing on the American imagination that a new revolution for human rights was being ushered in.

The little town was peaceful and unprepared for this sudden attack, as unprepared as it would be today for a similar raid. By morning, however, the alarm had been spread; the church bells rang, military companies from Charles-

own and other neighboring towns began pouring in, the saloons were crowded with nervous and hard-drinking men, and there was the clamor and furor of thousands of awe-struck Southerners. No one knew how many men were in the Arsenal. No one knew whether the whole South was not being attacked by abolitionists, or whether or not all the slaves had armed and risen against their masters, as they had attempted to years before in Nat Turner's and other rebellions.

By noon the Southerners had begun the attack. They killed or drove out all the guards John Brown had stationed at various strategic points in the town; they murdered two of Brown's men they had taken prisoners, and tortured another. They managed to cut off all of Brown's paths of retreat, and by nightfall, he and the few survivors of his men were in a trap.

His young son Oliver, only twenty years old, and recently married, died in the night. He had been painfully wounded, and begged, in his agony, that his father shoot him and relieve him from pain. But the old Spartan held his boy's hand, and told him to be calm, and to die like a man. Another young son, Watson, had been killed earlier in the fighting. John Brown had now given three sons to freedom, and was soon himself to be a sacrifice.

There were left alive and unwounded but five of Brown's men. The Virginia militia, numbering, with the civilians in the town, up to the thousands, seemed afraid to attack this little group of desperate men. In the dawn of the next morning, however, United States marines, under the famous commander, Robert E. Lee, then a Colonel in the Federal forces, attacked the arsenal and captured it easily. John Brown refused to surrender to the last; and he stood waiting proudly for the marines when

they broke down the door and came raging like tigers at him.

A fierce young Southern officer ran at him with a sword, that bent double as it pierced to the old man's breast-bone. The young Southerner then took the bent weapon in his hands and beat Brown's head unmercifully with the hilt, bringing the blood, and knocking senseless the old unselfish and tender champion of poor Negro men and women. Those near him thought John Brown was dead; but he was still alive; he had still his greatest work to do.

JOHN BROWN'S MEN

I have written almost entirely of John Brown, and because of necessities of space I have given little attention to the brave youths who fought under him at Harper's Ferry. Yet here I must stop and with only the facts, paint some portrait of the men who followed John Brown. It will be seen that they were no ordinary ruffians, no bandits, adventurers or madmen, as the South called them at the time. They were young crusaders, thoughtful, sensitive and brave. They had a philosophy of life; and they were filled with passion for social justice. One may disagree with such men, but one must not fail to respect them.

There were twenty-one men with John Brown at Harper's Ferry, sixteen of whom were white and five colored. Only one was of foreign birth; nearly all were of old American pioneer stock.

John Henry Kagi was the best educated of the raiders, largely self-taught, a fine debater and speaker, and an able correspondent for the *New York Tribune* and the *New York Evening Post*. He had been a school-teacher in Virginia,

and had come to know and hate slavery there, protesting so vigorously that he was finally run out of the State. He practised law in Nebraska, but left this to join John Brown in the Kansas fighting. He was killed at Harper's Ferry.

Aaron Dwight Stevens was in many ways the most attractive and interesting of the personalities about John Brown. He ran away from his home in Massachusetts at the age of sixteen, and joined the United States army, serving in Mexico during the Mexican War. Later he was sentenced to death for leading a soldiers' mutiny against an offensive pro-slavery Major at Taos, New Mexico. President Pierce commuted the sentence to three years at hard labor in Fort Leavenworth. Stevens escaped from this prison, and joined the Free State forces in Kansas, for he had always been a firm abolitionist. Stevens came of old Puritan stock, his great-grandfather having been a captain in the Revolutionary War. He was a man of superb bravery and of wonderful physique; well over six feet, handsome, with black penetrating eyes and a fine brow. He had a charming sense of humor, and a beautiful baritone voice, with which he sang in camp and in prison. He was hung soon after John Brown for the Harper's Ferry raid.

John E. Cook was a young law student of Brooklyn, New York, a reckless, impulsive and rather indiscreet youth, to whom much was forgiven because of his genial smile and generous nature.

Charles Plummer Tidd escaped after the raid, and died a First Sergeant in one of the battles of the Civil War. He had not much education, but good common sense, and was always reading and studying in an attempt to repair his lack of training. Quick-tempered, but kind-

hearted, a fine singer and with strong family affections.

Jeremiah Goldsmith Anderson, killed at Harper's Ferry in his 27th year, was also of Revolutionary American stock. A sworn abolitionist, he wrote in a letter three months before his death: "Millions of fellow-beings require it of us; their cries for help go out to the universe daily and hourly. Whose duty is it to help them? Is it yours? Is it mine? It is every man's, but how few there are to help. But there are a few to answer this call, and dare to answer it in a manner that shall make this land of liberty and equality shake to the center."

Albert Hazlett, executed after Brown, was a Pennsylvania farm worker, "a good-sized, fine-looking fellow, overflowing with good nature and social feelings."

Edwin Coppoc, also one of those captured and hung, was well-liked even by the Southerners who saw him in jail, and some of them hoped to get him pardoned. He came of Quaker farmer stock.

Barclay Coppoc, his brother, was not yet twenty-one when he fought at the Arsenal. He escaped after the raid, but was killed in the Civil War. After the raid he had returned to Kansas, and had nearly lost his life in an attempt to free some slaves in Missouri.

William Thompson, a neighbor of the Browns at North Elba, in New York, was killed at Harper's Ferry, in his 26th year. He was full of fun and good nature, and bore himself unflinchingly when face to face with death.

Dauphin Osgood Thompson, his brother, was only twenty years old, when he met the same fate for the cause of freedom. Dauphin was a handsome, inexperienced country boy, "more like a shy young girl than a warrior, quiet and good," said one of the Brown women later.

Oliver Brown, John Brown's youngest son, was also twenty years old when he died at Harper's Ferry. His girl-wife and her baby died early the next year. "Oliver developed rather slowly," says Miss Sarah Brown. "In his earlier teens he was always pre-occupied, absent-minded—always reading, and then it was impossible to catch his attention. But in his last few years he came out very fast. His awkwardness left him. He read every solid book that he could find, and was especially fond of Theodore Parker's writings, as was his father. Had Oliver lived, and not killed himself with over-study, he would have made his mark. By his exertions the sale of liquor was stopped at North Elba."

John Anthony Copeland, a free colored man, 25 years old, was educated at Oberlin College. He was dignified and manly, and in jail there were prominent Southerners who were forced to admit his fine qualities. He was hung for the raid.

Stewart Taylor, the only one of the raiders not of American birth, was a young Canadian wagon-maker, 23 years old. He was fond of history and debating, and heart and soul in the abolition cause. Killed in the Arsenal.

William H. Leeman, the youngest of the raiders, killed in his 19th year. He had gone to work in a shoe factory at Haverhill, Mass., when only 14 years old, and though with little education, "had a good intellect and great ingenuity." He was the "wildest" of Brown's men, for he smoked and drank occasionally, but the Old Puritan captain liked him, nevertheless, for he was boyish, handsome, and brave.

Osborn Perry Anderson was also a Negro. He escaped after the raid, and fought through the Civil War.

Francis Jackson Meriam, was a wealthy,

young abolitionist who put all his fortune into the cause, and came from New England to join John Brown in the raid. He escaped also, and died in 1865, after having been the captain of a Negro company in the Civil War.

Lewis Sheridan Leary, colored, left a wife and a six-months-old baby at Oberlin, Ohio, to go to Harper's Ferry. He was a harness maker by trade, and descended on one side from an Irishman, Jeremiah O'Leary, who fought in the Revolution. Leary was 25 years old when he died of his terrible wounds in the Arsenal fighting.

Owen Brown, another of John Brown's sons, was stalwart and reliable, and is reported original in expression and thought, like all the Browns. He is also said to have been quite humorous. He survived the raid, and died in Pasadena, Calif., in 1891.

Watson Brown, another son, 24 years old when killed at the Ferry, was tall and rather fair, very strong, and a man of marked ability and sterling character.

Dangerfield Newby was born a slave in Virginia, but his father, a Scotchman, freed him with other mulatto children. Newby had a wife and seven children still in slavery, and he was trying to raise money to buy them, for they were to be sold further south. He failed at this; and joined John Brown in desperation. He was killed at the Ferry, and so failed to free his poor family, as he had dreamed.

Shields Green, colored, was also born a slave, but escaped, leaving a little son in slavery. He met Brown through Frederick Douglass, the great Negro orator, and joined in the raid, though many warned him it would mean his death. He was uneducated, but deeply emotional, and deeply attached to the "ole man,"

as he called John Brown. He was hung after the raid; his age 23.

They were all young men; the average age of the band was 25 years and five months. They were all strong, intelligent, in love with life and eager for the future; but they chose to attempt this mad, dangerous deed rather than consent any longer to the lie and to the power of black slavery.

John Brown they followed and loved as one would a strong and kindly father. There was always something patriarchal about John Brown and his soldiers, many observers said. It made his deed seem like some story out of the Bible, the swift and terrible justice of the Lord of Hosts.

THE "NIGGER-THIEF"

When the South heard of John Brown's raid, there was a wave of immediate fury. Men poured by the thousands into the little Virginia town, and the bars were filled with savage, half-drunk men, who talked of lynching the "old nigger-thief." Governor Wise had come down from the capital, and he and others prevented any such disgraceful procedure. He himself was mystified by the raid. It seemed an incredible performance, for these Southerners could not understand the moral passion that animated the Abolitionists. To the south Negroes were property—private property. And an attempt to free slaves was to them insane, illegal and criminal. When men came with arms for this purpose and Southerners were killed in defending slavery, the crime became doubly damnable.

John Brown, after his capture, was taken with

Aaron Stevens to a room nearby. Lying on a cot, his head bandaged, his hair clotted and tangled, hands and clothing powder-stained and blood-smeared, the old lion was questioned by Governor Wise and a party of officials, who included Robert E. Lee, Colonel J. E. B. Stuart, Senator Mason, Congressman Vallandigham of Ohio, and other pro-slaveryites.

Their questions were a summary of the attitude of the South to such as he. And John Brown, though he was wounded and a prisoner, though everywhere enemies surrounded him, and the gallows stared him full in the face, answered their questions calmly and courteously, without the slightest show of fear.

"Who sent you here?" one official asked. They were trying to worm out the names of Northerners who had given Brown money for the raid, so as to prosecute them for conspiracy in murder.

"No man sent me here," John Brown answered calmly. "It was my own prompting, and that of my Maker, or that of the devil, whichever you please. I acknowledge no man in human form."

"What was your object in coming?"

"I came to free the slaves."

"And you think you were acting righteously?"

"Yes. I think, my friends, you are guilty of a great wrong against God and humanity. I think it right to interfere with you to free those you hold in bondage. I hold that the Golden Rule applies to the slaves, too."

"And do you mean to say you believe in the Bible?" some one said, incredulously. They could not understand this man; they only saw a wild, mad "nigger-thief" in him.

"Certainly I do," John Brown said with dignity.

"Don't you know you are a seditionist, a traitor, and that you have taken up arms against the United States government?"

"I was trying to free the slaves. I have tried moral suasion for this purpose, but I don't think the people in the slave states will ever be convinced they are wrong."

"You are mad and fanatical."

"And I think you people of the South are mad and fanatical. Is it sane to keep five million men in slavery? Is it sane to think such a system can last? Is it sane to suppress all who would speak against this system, and to murder all who would interfere with it? Is it sane to talk of war rather than give it up?"

Thus John Brown uttered his challenge to the South; but they failed to understand.

THE TRIAL AT CHARLESTOWN

And they failed to understand that it was not he who was on trial at the Charlestown court-house a month later, but the whole slavery system.

Every moment of that trial was reported in the newspapers of the nation. Every reader in America knew of the wonderful strength and majesty of John Brown in the court-room. The North began thinking about slavery as it had never thought before. John Brown was so manifestly pure in his intentions; manifestly a crusader, and people were forced to try to understand why an old, gray-haired farmer should have taken up arms at the age of sixty, after a life spent in useful occupations.

His dignity, his piety, his reputation as a terrible fighter, and the Biblical sublimity of the picture of this white-bearded patriarch sur-

rounded by his seven sons, all of them armed with rifles, all of them ready to die for the cause of abolition—these had their powerful effect on the imagination of the North. Hosts of new friends rose up in Brown's defense; legislatures passed resolutions asking for his pardon, Congressmen began speaking out, newspapers suddenly found themselves in danger of losing their subscribers if they spoke against John Brown; everywhere in the North men found themselves waking from a dream, and coming into the clear, white vision of John Brown. They saw slavery as if for the first time in all its horrors; they could not help taking sides. And the South became more and more inflamed with rage as the trial progressed, and those reverberations reached it from the North.

John Brown was tried on three charges, murder, treason, and inciting the slaves to rebellion. The trial was quickly over; it was but a formality. The jury, of course, returned the verdict of guilty, and John Brown, lying on his cot in the court-room, said not a word, but turned quietly over on his side, when he heard it.

A few days later, Judge Parker pronounced the sentence of death, and this time John Brown rose from his cot, and drawing himself up to his full stature, with flashing eagle eyes, and calm, clear and distinct tones, he addressed the citizens of America. He said many things that they were soon to understand clearly on the battlefields of the Civil War.

—"Had I taken up arms in behalf of the rich, the powerful, the intelligent, the so-called great, or in behalf of any of their friends, or any of their class, every man in this court would have deemed it an act worthy of reward rather than of punishment. But this Court acknowledges

the validity of the law of God. I see a book kissed here which is the Bible, and which teaches me that all things that I would have men do unto me, so must I do unto them. I endeavored to act up to that instruction. I fought for the poor; and I say it was right, for they are as good as any of you; God is no respecter of persons.

"I believe that to have interfered as I have done, as I have always freely admitted I have done, in behalf of His despised poor, I did no wrong, but right. Now, if it is deemed necessary that I should forfeit my life for the furtherance of the ends of justice, and mingle my blood further with the blood of my children, and with the blood of millions in this slave country whose rights are disregarded by wicked, cruel and unjust enactments, I say, let it be done."

Judge Parker fixed the date for hanging on December 2nd, 1859, a month away. It was a fatal mistake for the South, and John Brown's finest gift at the hands of the God he believed in.

THE AGITATOR IN JAIL

For in that month, John Brown accomplished more for abolition than even the stern deeds of Kansas had effected. He had put by the sword forever, and now for a month took up the pen and made it as powerful a weapon. He wrote innumerable letters to Northern friends and they were published and read everywhere. Their tone was Christ-like; no longer was Brown the militant Captain in the field, but the sweet, patient martyr waiting for his end in tranquil joy. In many letters he repeats the statement that he is glad to die; that his death is

of more value to the cause than ever his life could have been. This was no vainglorious hysterical gesture with John Brown; he was calmly certain of it; he slept peacefully as a child at night, and wrote his letters by day, secure in his tranquil wisdom. Friends were planning an attempt to rescue him, but he forbade them to try, for he really felt that his death was necessary. "I am worth now infinitely more to die, than to live," he said.

And in his letters he gave Americans his last warning on the slavery question. He told them it must be settled; it could not go on. His letters were so strong, manly, and yet so touching, that even the jailor wept as he censored them in the course of his duties. As Wendell Phillips said, the million hearts of his countrymen had been melted by that old Puritan soul.

With absolute equanimity, John Brown wrote his will, wrote his last few letters to his family, determined the coffin in which he was to be buried, and the inscription on the family monument, said farewell to his fellow-prisoners and jail-keepers. On the morning of December 2nd he stood calmly on the steps of the scaffold and gazed about him. Before leaving his cell he had handed to another prisoner the following last and uncompleted message:

"I, John Brown, am now quite certain that the crimes of this guilty land will never be purged away but with blood. I had, as I now think, vainly flattered myself that without much bloodshed it might be done."

Now, as he looked about, he could see massed beyond the fifteen hundred soldiers Virginia had felt necessary for this execution, the hazy outlines of the Blue Ridge mountains. The sun was shining; the sky was blue, and his heart was at peace. "This is a beautiful country," he said, "I never had the pleasure of really

seeing it before." He walked with perfect composure up the steps, watched by the eyes of the soldiery and officialdom of slave-holding Virginia. They saw not a tremor in his face or body; not even when the cap was drawn over his head, his arms pinioned at the elbows, the noose slipped around his neck. He had refused to have the solace of any ministers, for they believed in slavery, and he told them he did not regard them as Christians. He needed no man's solace; he was braver than any one there. "Shall I give you the signal when the trap is to be sprung?" said a friendly sheriff. "No, no," the serene old man answered, "just get it over quickly."

And quickly enough, it was all over for John Brown. The trap was sprung; his body hung between heaven and earth. In the painful silence that followed, the voice of Colonel Preston declaimed solemnly, the official epitaph, "So perish all such enemies of Virginia! All such enemies of the Union! All such foes of the human race!"

That was the verdict of the South, still infatuated and blinded by its slave system. But on the other side of the Mason-Dixon line men were pronouncing a different verdict on John Brown, and on the other side of the Atlantic, the greatest man of letters in Europe, Victor Hugo, was saying:

"In killing Brown, the Southern States have committed a crime which will take its place among the calamities of history. The rupture of the Union will fatally follow the assassination of Brown. As for John Brown, he was an apostle and a hero. The gibbet has only increased his glory, and made him a martyr."

HIS SOUL GOES MARCHING ON

John Brown was hung on December 2, 1859. Exactly eleven months later Abraham Lincoln was elected President of the United States. Exactly eight months after that, Northern troops were marching southward, to put down the rebellion of the slave states that had hung Brown.

No one at the time believed events would march so swiftly after Brown's death. There were many who knew that some sort of conflict between the North and South was inevitable; it had been brewing for decades. But there were as many more who were confident that slavery would win its legal fight, and would spread over the whole continent. And the great mass of Americans just faintly understood the issues involved; to most of them, John Brown seemed some kind of mad fanatic.

President Lincoln's election undoubtedly provoked the Civil War. And his election was undoubtedly due to the discussion on slavery that raged after John Brown's deed. Lincoln was the first Northerner to be elected in forty years; the South had always carried things before it, and would have done so again had not John Brown roused the entire North to a consciousness of what slavery meant.

He did more than all the abolitionists had been able to do in their fifty years of agitation.

And yet even most of his friends thought him mad at the time of the deed. Abraham Lincoln, in a campaign speech at Cooper Union, in New York, said: "Old John Brown has been executed for treason against a state. We cannot object, even though he agreed with

us in thinking slavery wrong. That cannot excuse violence, bloodshed and treason."

Only men of the stamp of Wendell Phillips fully understood what John Brown had done. His funeral oration at the last resting place of John Brown's body had all the vision of the prophets:

"Marvelous old man!....He has abolished slavery in Virginia. You may say that this is too much. Our neighbors are the very last men we know. The hours that pass us are the ones we appreciate the least. Men walked Boston streets, when night fell on Bunker Hill, and pitied Warren, saying, 'Foolish man! Thrown away his life! Why didn't he measure his means better?' Now we see him standing colossal on that blood-stained sod, and severing that day the tie which bound Boston to Great Britain. That night George III ceased to rule in New England. History will date Southern emancipation from Harper's Ferry. True, the slave is still there. So, when the tempest uproots a pine in your hills, it looks green for months, for a year. Still, it is timber, not a tree. John Brown has loosened the roots of the slave system; it only breathes—it does not live—hereafter."

Wendell Phillips was a prophet; and even men of wide vision like Lincoln could not attain his lofty view. At first there was a rush of Northern politicians to disavow and condemn John Brown's deed. Later, there was approval; still later understanding; still later, worship.

Yes, the old man seemed mad, as all pioneers are mad. Gorky has called it the madness of the brave. But such madness seems necessary

to the world; the world would sink into a bog of respectable tyranny and stagnation were there not these fresh, strong, ruthless tempests to keep the waters of life in motion.

Who knows but that some time in America the John Browns of today will be worshipped in like manner? The outlaws of today, the unknown soldiers of freedom.

"And his soul goes marching on."

Hints on Writing Short Stories

Charles J. Finger

HALDEMAN-JULIUS COMPANY
GIRARD, KANSAS

INTRODUCTION

In this I have not compiled a guide to rhetoric in the conventional style of the Correspondence Schools. My aim has been to convey to you a number of ideas. When you have read the book, there should remain, forever fixed in your mind, this:

Truth is the final test of merit in literature.

I.

ON CORRESPONDENCE SCHOOLS.

This, let me say, is my third attempt to write this booklet. Two drafts went into the waste basket. The truth is that I found them too stiff and formal, and in the doing of that which I wish to do, formality must be sedulously avoided, for, otherwise, we run on a rock and get nowhere. It seems to me that the best plan in telling you what I have to say will be one in which curtness and directness is observed, for very direct and brief I have always found those to have been who were instructors and not teachers. Not in long and labored discourses have I found valuable lessons, but rather in very sudden "Don'ts" and "Do's," in warnings and in checkings. Indeed, something of that would seem to be the natural way, especially if you consider how wonderfully children learn from children. Youngsters never lecture one another, yet they teach their fellows all manner of elaborate games with a few simple directions. On the other hand, not only teachers, but also parents, too often flounder in a mist of explanation and so fail to make anything clear. I know that in my own life almost everything that I have learned I seem to have acquired suddenly. In the midst of much struggle, a warning word, a caution shot from someone who knew did what tons and volumes of

theoretical instruction had failed to do. There was swimming for instance. As a lad I had read books on the art, diligently going through arm and leg motions at night while balanced on a stool. I had memorized instructions and had filled my memory with facts as to swimming contests among the ancient Egyptians. Then, one day, floundering in a pool with a secret vision of a slow and painful death burdening me, an older lad shouted, "Push at the water with your feet—push hard," and lo! the trick was learned. It was much the same when I learned to ride a bicycle. I had made sudden swoops and turns, had borne down on rocks, and holes, and ruts, with strange accuracy. I had hit all that I tried to avoid. Then my brother yelled at me, "Don't bear so heavy on the handle bars," and a great light dawned, for I saw that my misdirected energy had been my drawback. Then, too, when learning to shear sheep in South America. The sheep, the shears, the fleece, and I seemed to be dangerously mixed, and, while other men about me did their hundred and seventy ewes a day with ease, I sweated and groaned over twenty-five. But a wise old Irish shepherd who was watching me gave me a hint. As he walked away, he growled, "Keep the shears flat on the hide and take big bites." And again the curtain was lifted, so that that day I tallied my hundred and ten.

For these and other reasons I have always been suspicious of elaborate books of instructions, and also of professors, of correspondence schools, and of institutes purporting to teach

this, that and the other: how to raise your salary: how to be prosperous: how to be a society success: how to acquire a mastery of the English language while shaving: how to develop the qualities of leadership and rule others: how to write short stories and become a successful author. And, indeed, talking with other men, I find that each holds that his own business, profession, or calling, most certainly cannot be taught by mail, nor acquired in such manner that the reader of a dozen or more mimeographed letters may hope to make a living by it. On this every man is emphatic. Nor scanning advertisements, lists of men wanted, do I see this: "graduates of correspondence schools preferred." Certainly, when I was an employer in the railroad business, I never employed a locomotive engineer on the strength of a diploma dated from Scranton, Pa. Nor have I met a banker, stone mason, professional hobo, concert pianist or a farm-hand who, good at his life's work, had clipped and mailed a coupon, received a hundred page book, and, from such humble beginnings achieved mastery of his chosen task. Further, being once idle and mischievous I made a list of names of several who offer to teach the Demosthenian art. These, in the course of time, I visited at "Department 1234," or at the Cicero Institute in Chicago, or wherever the office was located, but although I have reached the inner circles in giant corporations, in government houses, in banking institutions, I failed to pass the guardian stenographer and so

reach the orator himself. Neither, on further investigation, could I find that Chauncey Depew, Ingersoll, Billy Sunday, Henry Ward Beecher, Herbert S. Bigelow or William Jennings Bryan ever took lessons in a correspondence school. Still pursuing my quest, I also made a list of names of those teaching the art of short story writing, whether they were hidden in the arcana of correspondence schools, taught in the marble halls of colleges or universities, or in the shacks of the Y. M. C. A., to find that those names did not appear as authors in the table of contents of well-known magazines, nor anywhere else where one might reasonably suppose that they would be eager to see their own names as practitioners of the art they professed to teach. Nor did it transpire that executives and those who have control of men, captains of industry or those who weld others to their own desires, college professors or bishops, had, before gaining their present eminence, risen up one dark morn in a dull December to make a test of their efficiency by answering for themselves a list of forty questions as propounded in the advertising section of some magazine, and, realizing their lack of Personality, had straightway enrolled themselves for a "correspondence course," in the course of time to receive a diploma and become a Gary, a Schwab, a Wanamaker, a Woodrow Wilson, a Harriman or a Lloyd George. No. No. Things do not come that way.

From all of which, you can see that I do not

believe that much good can be done in the way of teaching by mail, nor even by book. Nor can you, I hold, by reading an analysis of a short story or a novel, write one. You can no more do that than you can, after dissecting a human corpse, construct a man. True, you may, with some advantage read the things other men have done, but it does not therefore follow that you yourself can do them, even though you have the desire and the will. For instance, I am a very poor mechanic. To handle machinery is a thing distasteful to me. I might read twenty-four books on the method of adjusting a timer on an automobile, but, when my own timer gets out of order I am dumfounded, nor will all my theoretical knowledge stand me in stead. My son, on the other hand, who has never read a book on the mechanism of an automobile, actually rejoices when the car stalls. The light of joy is in his eye and he leaps from the seat and goes to work with enthusiasm, pooh-poohing such things as I tell him from my corner in the car as the result of my reading. He is contemptuous of authority and is all for independent verification.

Why then, in the face of all this, do I write this booklet? For, admittedly, I cannot teach you to write a short story although I have written dozens of them.

Here is the answer. If you have both the ability and the desire to write, I can tell you of some pitfalls to be avoided and can give you a hint or two. I can also give you the result of my own experience, and that is about all.

It may result in something, and again it may not. Certainly during the past year, I have had the pleasure of seeing three young writers get their work in print as a result of some such advice as I propose to write here. But I shall not, I promise you, pad the book, nor copy out stories written by masters in the art, in the approved way of the correspondence schools and the "institutes." That would sadly waste both your time and mine. So, to work.

II.

THE KEY NOTE.

In the first place there must be *Sincerity*. Without that nothing can be done. Sincere work will be good work, and sincere work will be original work. With sincerity, you will have honesty and simplicity, both of which are cardinal virtues in the literary man. Also, with sincerity there will be courage. You know, as well as I know, that when you meet an insincere man, you detect him at once. Were you ever deceived, for instance, by the rounded periods of some political rhetorician? Perhaps for a moment you may have been carried away in spite of your better sense, but, certainly, the effect was not lasting. Examining yourself, you will certainly remember that before you could persuade others, you had to be thoroughly convinced of the essential right of the thing itself. In the same fashion then, you must be persuaded of the truth of that which you wish to be accepted when writing. I do

not speak of controversial matters. I write of fiction. You must have so thoroughly identified yourself with your characters that they are as living creatures to you. Then only shall they be living characters to your readers. If you have read the *Pickwick Papers* and have learned to know and love *Samuel Pickwick*, you will know exactly what I mean. In that character, the young Charles Dickens lost himself. In creating Mr. Pickwick he was entirely sincere. He watched the character grow from a somewhat simple-minded old gentleman to a lovable, jolly fellow to meet whom you would walk half round the world. Pickwick was real to Dickens, therefore he is real to us. Observe this too; he had his faults. *Mr. Pickwick* would not have been considered a good or a moral character to many of the "unco guid" of today. He often drank too much. Had there been nation wide prohibition in England in his day, he would certainly have drunk home brew with *Ben Allen* and *Bob Sawyer*, exactly as he went to prison for conscience sake. He and his companions enjoyed the pleasures of the table too well for latter-day tastes. He was obstinate on occasion, just as I am obstinate. Had Dickens been insincere, he might have been tempted to sponge out the bad spots in his character. But then he would have given us something that was not a man. The truth is that we want something of the senuous and the gross in those about us. None of us want to live with angels and saints. So we reject instinctively as impossible and unpleasant, those perfect, etherealized crea-

tions some times found in stories—those creatures all compounded of nobility, courage, beauty, generosity and wisdom which insincere writers try to foist upon us. They do not ring true. We detect their hollowness just as we detect the hollowness of the flamboyant boastings of the political orator.

Indeed, to a reading man, the creations of the imagination of sincere writers are much more real than the famous characters of history. At least they are so to me. I read of a Washington with all his ugly spots carefully painted out; of a Napoleon carefully deified; of a Garfield carefully haloed; and I mentally reject them as impossible. On the other hand I become acquainted with a *Captain Costigan*, a *Becky Sharp*, a *Jack Falstaff*, an *Uncle Toby*, a *Tom Jones*, a *Martin Wade*, a *Peter Whiffle*, an *Ann Veronica* and they enter into my life. I know them utterly. I meet their twins in life. This woman has the green eyes of *Becky*. That man has his aspirations, leads a life that he knows to be a wrong way but still leads it, exactly as did *Tom Jones*. Or I recall a foolish fellow whose interest in life led him into all sorts of odd corners and am immediately reminded of *Peter Whiffle*. But I never meet a man who reminds me of Napoleon or of Washington, because there are no such men. In other words, the sane fiction writer has been sincere—the historian has been insincere. In the effort to give a mere man a heritage of honorable fame, the historian created something infamous, something inhuman.

III.

ON CHARACTER MAKING IN FICTION.

As my own personal character is by no means perfect, or even complete though imperfect, it follows that I cannot teach you how to draw a character. Certainly, I have, however sketchily, drawn a few characters in different stories, but I find that they were all more or less an aspect of myself. I have never yet committed a murder, but I have hated some people so fiercely that I have imagined the killing of them. So, the mood being on me, I once wrote a story called "Ebro" in which the hero was a murderer. But, in a way, *Ebro* was myself. Again, once in the long ago, when I was young and beautiful, I started on a wild trip in a small sail boat from the Straits of Magellan bound for the Falkland Islands. We had been in search of hidden treasure, which we did not find, and, having been in forbidden places, were forced to flee. Now some two hundred miles from shore we ran into a storm and there was much to do. During that storm I was terribly afraid. Like any other coward, I died a hundred deaths. That experience I remembered and it came to light when I wished to write the story, "My Friend Julio," wherein was portrayed a man much terrified by wind and water. So, in my imagination, one way or another, I have broken each and every one of the ten commandments. Some, of course, I have broken in reality. The heroes, or characters I draw then, as I see it, are merely pictures of myself seen

from this angle or that, the same individual in his varied moods. It is somewhat like the watching of a diamond and seeing different colored rays as the light from this facet or that is caught. In every man are many vices as well as many virtues. Each must know himself, see himself naked and as he is, without idealistic fig leaves.

Still, though I cannot tell you what to do, I can chart a few shoals so that you shall not run aground too early in your literary voyage.

First of all then, as I have said, there is the prime necessity of Sincerity. Second, no man can possibly write anything at all worth while except he see straight. By that I mean that most men do actually see things in a distorted kind of a way. I do not mean by this the habit of careless seeing, nor even of blurred seeing. What I do mean is that habit of not seeing at all for oneself, but seeing through the eyes of others. Take, for example, the people who have lived in a small town for a great many years and have heard political orators, Chautauquan lecturers, candidates for this office and that talk about the "handsome men and beautiful women, the intelligent children and public-spirited citizens" in the burg. You will find that many who have listened to that kind of thing year in and year out, do actually come to believe that their fellow townsmen and townswomen are thus and so. They become firmly convinced that theirs is a favored spot in which beauty abounds. Of course, a glance at any well-filled kodak album will reveal the fact that in place of a

wide-spread beauty, there is an incredible amount of vulgar and quite healthy ugliness. Or, again, if you ask a dozen men to describe the average American youth, eleven of them will conjure up a vision of some long-legged, square-shouldered fellow unlike anything on earth, or of some square-chinned, bright salmon-colored lad. Their notions, you will find, are derived, not from their own observation, but from seeing advertisements put out by wholesale clothing warehouses and makers of men's collars. Or imagining the American girl, they will see not what you may see, girls flabby, skinny, awkward, sloppy, tall, short, lopsided, sometimes pimpled, and, very rarely, one now and then really beautiful, but instead, some baby-faced creature with idiotic simper in the style of a magazine cover. Or again they will be led into unquestioning belief when the politician aforementioned who, ringing the changes upon all the familiar phrases of political oratory, and intoxicated with his own flamboyant boastings, perhaps whooping things up for war, declares that military training has made a generation of square-shouldered, deep-chested lads. People listening to him, who make the sign of the cross every time The Star Spangled Banner is played, will be quite oblivious to the fact that a moment's glance into any street will reveal the truth that, in spite of three years in the trenches, the young men of today slouch and stoop, lean and shuffle, and lounge against corners and posts just as much as ever they did before 1914. It will never occur to them that the square-shoul-

dered effect of the khaki-clad lad was entirely due to the odd cut of the coat. So, I add this then. SEE STRAIGHT.

Here is another law, or commandment, or guide, or whatever you choose to call it. I give it to you in seven words. SET DOWN THE THING AS IT IS. Do that and you get somewhere. Fail to do it and you inevitably get nowhere. That rule, of course, loops back on the one preceding it, for before the thing can be set down as it is, one must be sure that it is seen as it is. The trouble is that so much is about us that tends to distort. Pictorial artists, newspaper men, moving picture producers are all in league to get a "feature" angle on things, so it comes about that presently we are in such fix that we actually mistrust the evidence of our own senses. Not so long ago I attended a piano recital in which the performer played several compositions which I know so well that I could tell you every note in every chord. But the clumsy fellow came a cropper, turning his minor chords here and there into majors, dropping his octaves and making a great muddle of things. From force of habit, or convention, the audience applauded and the player bowed with happy smile, whereupon the audience cheered the more lustily. The next day the local paper came out with an account of the affair praising the player in terms which, if applied to a Liszt, would still be extravagant. After that, you could no more shake the audience in its admiration of the player as a highly skilled fellow than you could persuade it

that the moon had turned to green cheese. Ignorance won the day. Hearing the applause, even those who knew something of music mistrusted their senses. Let a word be dropped in criticism, and the newspaper report was produced. There it was. What more was needed? A wrong notion was born because of convention, and fostered because of wilful or ignorant distortion, with the result that hundreds of young children for years to come would learn music from an incompetent fellow. Nor, probably, would those children, with one or two exceptions, ever learn to play straight.

Again go to a picture theater in which is being shown a reel or two of Current Events. Roughly speaking, you would imagine, judging from the scenes displayed, that all that was ugly, hideous, vulgar had disappeared from the world. And naturally so, because active selection has been at work. To get a "good" picture, the camera man and his assistants had seen to it that undesirable sights were avoided or hidden. In the course of time, seeing hundreds or thousands of such pictures, the average man arrives at wrong notions as to things about him. Indeed, it is only when the same man goes far from home to another country, or to a far away city, that his eye and mind begin to function. Then new things strike him. He compares them, not with the things as they are in his own home, but with the things he has seen portrayed, which is a vastly different matter. As a consequence, he finds the new to compare very unfavorably with the

old as he imagines the old to be. Then he becomes verbose and a nuisance to those around him, telling of the glories of things in Tucumcari or wherever he may have hailed from. He forgets, or never saw, that in his native habitat there was ugliness, brutality, debauchery, disease and deformities. So presently, your traveler returns home, tells tales of foreign parts and deplores the state of things abroad which are, after all, exactly the same as in his own home town. You see, in the new place his eyes were opened. He was shocked into seeing. In his own town he saw so often that he ceased to see, or, being incurious, saw through other eyes. So I have heard men deplore the poverty in rural districts in other countries, telling of women and children toiling in the fields under a hot sun, of families that ate little or no meat or fats from one end of the week to another, quite oblivious of the fact that in their own land also, children of tender age are taken from school to the field, and that in thousands of places throughout this country, sweet potatoes and beans form the staple diet. The same men will make merry at the expense of a simple Mexican who crosses himself when the thunder roars, or who wears a charm to ward off rheumatism, all unconscious of the fact that there are Americans in plenty who hold that a buckeye carried in the hip pocket will cure piles, or that the position of the quarter moon foretells dry or wet weather according to the way in which the horns are "up" or "down." Verily, I say unto you, it is the rarest of rare

things to find a man who can see straight, and except he see straight, how shall he set down things as they are?

To take this important matter from another angle, have you ever looked at a set of engravings by Hogarth? To be sure there are pictures by other artists, his contemporaries, but in them it is clear that there was elimination and distortion. But not so with Hogarth. He saw things as they were and so set them down. As a result, his work is as valuable to students of social manners and customs as are the diaries of Samuel Pepys. Not for him was the false picturization, the idealistic conception. To be sure the London of his day had its fine lords and ladies, but it had also its filthy beggars, its distorted and deformed men and women, its untidy children and haggard workers, its unfortunates with blotched and pimpled faces. So he gave us what he saw. Therefore Fame crowned him. First he was sincere, second he saw straight, and thirdly he set down the thing as it was. Pepys too did that. So did Holinshed and Fielding. Their names live. Aphra Behn played the game the other way and is forgotten. Also vanished the names of "Ouida" and of Charles Brockden Brown.

IV.

PREJUDICE.

Still, let a man set himself deliberately to see straight, to look at things without either rose-colored or smoke-dimmed glasses, and even then it is not certain that there is free-

dom from distortion. Just as the children studying music, of which I wrote a few pages back, were all unconsciously heavily handicapped, so are we also handicapped through no fault of our own. For one thing there has been grounded into us a certain prejudice called patriotism. It is really a reflex egoism. Because of it we are predisposed to look upon our own nation as standing alone on star-crowned heights and to regard all other nations and peoples as being in the gulf of ignorance, poverty and despair. So we get a one-sided impression. Blinded by national self-love, we see all good in our own people and little but evil in others, except those others be our allies, when we grant them some modicum of decent behavior and common sense just so long as, and no longer than, they identify their interests with ours. Nationally, we go in for the cygnification of geese on a gigantic scale. As may easily be seen, carried to excess, that kind of thing often results in hate. Not carried to such lengths, it means the ridiculing, as well as the misunderstanding of others, and in addition the fooling of ourselves. Consider the so-called "comic sheets" and the cheap vaudeville stage where the Frenchmen, Germans, Jews, Irishmen, Mexicans and all South Americans are used as laughing stocks. The reverse of the situation is seen in common, cheap literature where the American stands as the type of all that is admirable. Or, if you keep an attentive ear, you will not fail to note that the notion permeates in such strange way that it becomes very gen-

erally held, and even accepted to so wide an extent, that teachers teach their charges that there exist very strongly-marked national characteristics, as that the Dutch are very clean, the Mexicans very treacherous, Jews very much given to cheat, Germans to villainy and rape, Italians to idleness, Afro-Americans to light-heartedness, the French to immorality, the Irish to wit, the Scandinavians to pessimism, the Swiss to thrift and so on.

All of which is idle and pernicious clap trap, as a moment's quiet reflection will show. For each and every man in his experience has known among his own countrymen those who were clean and those who were dirty, those who were honest and those who were dishonest, those who were gloomy and those who were cheerful, those who were idle and those who were energetic. Moreover, every man knows that his own mood changes as the wind and he who is merry a-Monday may be very sad on Saturday, while he who is in the pink of honesty at 9 a. m. may easily be a thief at 9:30. Yet, for all the testimony of the daily papers and in spite of the records of the criminal courts, ninety-nine men out of a hundred are very thoroughly imbued with the idea that their country and its people have a practical monopoly of all the virtues. So, as might be expected, the notion gets into literature, modified it is true, but nevertheless it gets there.

To show it in its most crude form, I give an instance. It happened since I commenced this essay. A man called upon me and his eyes were bright and shining with excitement, for

he had what he imagined to be a good plot for a story, and had cut across lots to tell it to me. It ran something like this and I quote his words as nearly as possible.

"Here is a good plot for a short story or a moving picture. There's a young woman on the train, a Canadian, and she is a stranger to this here country. On the car she begins to talk with a well dressed drummer. She is innocent and all that kind of thing. But sitting across the aisle is a soldier. Well, at the depot this here drummer gets the girl to go with him to a hotel and just as they are getting into a taxi, up comes the soldier, and 'Biff,' he lands the drummer one that lays him flat. So the girl's safe. After a year or so the soldier comes from the war and finds the girl who is the daughter of a rich man. He's poor of course, the soldier. Well they marry and live happy . . . Of course, you can show the American ideals in this tale and also use it to bring about good relation between the English speaking people."

I will not insult the intelligence of the reader by pointing out the utter idiocy of the plot. Still, though the man who told me the story was intelligent, a lawyer in the government service, and a reader of the *Saturday Evening Post*, the *American Magazine*, several daily papers, and voted the straight party ticket every election, he failed to see the utter banality of the tale he suggested. But, it is a fair sample of the stuff with a "patriotic" base that many hundreds send to editors, and, more or less modified, watered, or spiced, you will at

times see something of the kind in moving-picture theaters.

So see this then; there are no characteristic national virtues and vices. Make your hero a negro, a Chinaman, an Eskimo or a Patagonian. It does not matter which. Man is man the world over, and it is, despite the old saying to the contrary, a safe rule to measure other's corn with your own bushel. What you must do is to conceive a character, then show him, not acting in any cut or dried fashion, but in a certain fashion. I say a certain fashion, but might have said an uncertain fashion, because your character will be more or less like yourself, a being with faults, virtues, vices, meannesses, ideals and hopes, and in him the potential angel will be mixed with a good deal of the ape, the tiger and the pig. Then, with your creation endowed with all the virtues and vices inextricably mixed, you have a character compounded of subtle and profound elements. Thus one sees that an action in a given case is indeed problematical. A man, witnessing overtures that may lead to the seduction of a girl, a stranger to him, whether the man was in uniform or not, would hardly be likely to make an assault upon the supposed seducer. To make him do that sort of thing is but to cater to the basest taste which glories in brute force. What a character would do would depend on many things—on his mood at the moment, whether he was drunk or sober, his immediate environment, his early training, what he had had for breakfast, what manner of rascal his grandfather was, how much money he

had in his purse at the time. Or it might depend on a mixture of many of these. Or again, the fictional personage might ponder and hesitate, finally taking no action at all, which, as a sensible man and being familiar with the old warning, "mind your own business," would very probably be his course. But the character might well be supposed to be wavering in a storm of emotion, perhaps to be swayed by subordinate characters, and, in the end, some action might be shown which would, as it were, grow out of the collision of the characters. For, bear in mind, the subordinate characters must not be made mere silhouettes—they also must have their prejudices and motives and ambitions, and the very form of their minds, too, must be made as evident to the reader as if they were in his presence.

Character drawing, as you see then, is a highly complicated business. Many, even among apparently sensible men, do not suspect this. For instance, not so long ago, I heard of a poet who declared that he could write a dozen good short stories between Tuesday and Saturday. His notion of fictional characters of course was of the allegorical order, a ticketed dummy in the form of the Sunday school book or of the transpontine melodrama, a row of Mr. Goodman's, Mr. Evil-Livers, Mr. Close-pennies and so on. It never for a moment occurred to him that the test of good workmanship lay in the ability of the author to make a distinct impression on the reader, to make him remember the fictional personage as vividly as he remembered characters met in real life.

At this point, should you be earnest in your quest, really ambitious to go further, I recommend to your reading as masterpieces of character drawing, Conrad's *Lord Jim*, Thackeray's *Becky Sharp*, Cunninghame Grahame's *Minor Prophet* in his "Brought Forward," H. G. Dwight's *Like Michael* in his "Emperor of Elam," *Uncle Toby* in Sterne's *Tristram Shandy*, and the portrait of *Mrs. Poyser* in George Eliot's *Adam Bede*. Or, failing these, if you are a very busy man, buy in the present series, Nos. 41 and 72, and study the character of *Old Scrooge* in Charles Dickens' *Christmas Carol*, and of *The Scab* in the *Color of Life*.

V.

DANGEROUS ENTHUSIASM.

But there is another dangerous shoal, another literary Goodwin Sands strewn with the wreckage of ambitious but unskilled voyagers. For of all people urged to write, those generous souls eager to lend a hand in the making of a paradise on earth are hardest pressed. The very fact that a young author hates tyranny and injustice in a thorough and unhesitating way, results in a kind of distortion. For him the evil pit of controversiality and partisanship yawns darkly. In his excess of zeal he paints with pigments too glaringly bright and too muddily brown. He makes his characters too black or too white, all evil or all good, according to their position in society. He is afflicted with an egoism of class, a fault every whit as gross as the

reflex egoism called patriotism. His judgment is warped by class prejudice. . Because he burns with zeal, because he is carried away with enthusiasm, there is distortion. His heroes are those poor in this world's goods, his villains the wealthy, the powerful, the aristocratic. That wealth as well as poverty may entail hardship and unhappiness, the author with sociological bent often refuses to see, or seeing, wilfully denies. That worry and weariness and disappointment is not removed when one has mounted a little out of the pit, is a fact that escapes him. That injustices suffered by wage earners would be no less were the administration of affairs discharged by men taken from their own ranks, is entirely lost sight of. So there comes about a gross exaggeration and a painting of types. You may see something of this in George Bernard Shaw's "Unsocial Socialist." Walt Whitman sinned in like manner in his earlier days of writing. The fictional literature of advanced movements is full of class consciousness.

That kind of thing, of course, is fundamentally due to a kind of disguised self-interest once removed. It is really the inordinate love of self, or of class, as such. Consequently, it is bad art. And being that, it accomplishes nothing, because the reader sees through the ulterior motive. Furthermore, to do that kind of thing is to set down the thing as it is not. For, as you know, there are both rascals as well as gentlemen among wage-earners, just as there are rascals as well as gentlemen among

capitalists. There are scoundrelly poor people just as there are scoundrelly rich people. Honesty and dishonesty, truthfulness and lying, fair dealing and foul dealing are matters entirely apart from rank and position. Indeed, a story or a novel based on such insecure foundation, must, of necessity, ring false from first to last. There will be no health in it. The characters will be shown with glib phrases rolling off their tongues, talking as no man ever talks who expects to be taken seriously. The dialogue will be false and strained, and rich man and poor will talk like fourth-rate evangelists, camp-meeting hot-gos-pellers or insane tub thumpers. As a terrible example, turn to the socialistic speech made in a drawing room by *Cashel Byron*, the pugilist, in George Bernard Shaw's novel. The older, more experienced Shaw makes no such mistake. Contarst *Cashel Byron* for instance with his *Major Barbara*.

On the other hand, to see what a master craftsman can do, you must take "The Dream of John Ball" by William Morris, No. 37 of this series. If you have read it, you will not have forgotten the good, earnest priest, a most uncompromising truth-teller who had so profound a belief in realities and held an equally profound hatred of sham, cruelty and injustice. Looking back, you will recall in the little story a peculiar vein of pleasantry and delicate fancy with occasional touches of tenderness and of pathos that is extremely attractive. I call your particular attention to that story because it was written by a man

actuated by a passionate sympathy for humanity. For Morris was a radical to be sure, but his radicalism was tempered by a profound and logical sense of justice, by devotion to truth and reality and by intellectual ability and clarity. Perhaps in the whole field of English literature there is no better instance of pure intellect combined with enthusiasm for justice. And yet with all this, the aim of the story was to lead people to an understanding of the cause he had at heart, which was socialism. Yet withal, any one utterly opposed to that cause may read the book with keen pleasure, and not only that, but will inevitably be led to sympathize with the aims of *John Ball*.

Why is this? How does it come that one man burning with zeal for a cause will repel those he seeks to win to his side, while Morris won opposing minds to a sympathy with a doctrine they had denounced? If for a moment you try to imagine a Baptist, we will say, writing a book in such fashion that Catholics will not only read it with enjoyment but by its means will become interested in the Baptist creed, the magnitude of the task Morris accomplished will be manifest. The fact of the matter is that Morris did his work so well, felt the joys and the griefs of his characters so keenly, in a word was so sincere, that the reader lost his prejudices in the ideal life portrayed and was impelled to identify himself with the creatures of Morris' fancy in such wise that what hurt them, also hurt him. Both writer and reader overlooked the social

philosophy by reason of immense delight in the characters themselves. So also it was with those who read Dickens' "Nicholas Nickelby" and "Little Dorrit" and both books had so far-reaching an influence that the first resulted in the reformation of the private school system and the second in the abolition of imprisonment for debt.

In this connection I think that you will gain much advantage and get some good ideas if you will read "The Man of Property," by John Galsworthy, "The Growth of the Soil," by Knut Hamsun, and by Cunninghame Grahame, "Success," "Brought Forward," "Faith" and "Progress." I find in this series as valuable, "He Renounced the Faith," by Jack London and "The Miraculous Revenge" by George Bernard Shaw.

VI.

MURDER AND VIOLENCE.

A word should be said as to murder, bloodshed, suicide and other cheap effects. When you come to think of it, there is an appalling amount of bloodshed in our literature. I can go to my daughter's book shelf and take down novel after novel, turn the pages swiftly with a glance here and there, to hit upon the murder which I know instinctively is there with unerring accuracy. Or I can pass to the bookshelf in which the boys keep their favorites, and find brute force galore. Men are knocked down, punched, run through, thrown down stairways, kicked and cuffed. On every other

page there is manifest a mighty recklessness.

Now of that kind of thing I am suspicious. Looking back in my own life, which has been far from a quiet one, many years of which were spent in uncivilized places, I find that I have seen but few deeds of violence, as between man and man. I do not refer to riots, wars and organized bloodshed. I remember seeing one man killed outright, one duel with knives, one saloon rumpus and perhaps four men knocked down. My experience has been exceptional. Talking with friends, I find many who tell me that apart from school-boy days, they have never as much as seen a man knocked down or a blow struck. That, I believe, is the common experience. Many may easily go through life without witnessing a single act of violence. Certainly, the vast majority of men never dream of striking another. The world is prosaic. There are more *Doctor Primroses* in it than there are *Squire Westerns*. Men are more given to have a fancy for oratorical tirades and philosophical discussions like *Mr. Shandy*, than for fighting and battering one another about like *Everett True*. It would seem that since the advent of the four-reel thriller in the picture shows, murder in literature has somewhat gone out of fashion. There has, indeed, been a gradual letting down in the matter of violence since the days of Shakespeare and his forerunners. Time was when men and women had to be glutted with horrors and cruelties. Nothing less than blood or death would satisfy them. They had to be dazzled with the full bright-

ness of evil lusts. Only tales in which lewdness, cruelty, love of gold, shamelessness or vice were portrayed met with favor. No character was unmixed with sensuality in the days of Massinger and Ford. The fact is that the early writers, in constructing a man, did not dig down deep into the foundations.

Today it is different. There is a genuine attempt to become acquainted with man in his fullness. Especially is this seen in the work of the makers of present-day literature such as Conrad, Grahame, Galsworthy, Hergeheimer, Lawrence. The days are past when, if it became necessary to portray a man of courage, there was a digging into the depths of diabolical and unchained nature. Unrestrained will is no longer the keynote. The newer and higher idea hinges solely on character. The Berserker has been retired.

Of course, the main idea intended, was to display evidence of courage. But, any intelligent man may see, with a moment's thought, that the mere fact that a man fights, is no evidence at all of courage. He may fight because he is a coward, and fight to the death, too. For instance, suppose a man is challenged to fight a duel. The writer who has not dug into human nature will see bravery in the fellow who immediately accepts the challenge. To be sure there is a certain brute courage in the act of fighting. But of two men thus fighting a duel, one may be much braver than another. A man of imagination, who foresees pain and death, is obviously braver than another who

has no imagination at all, just as a boy who fears the dark, but yet bottles up his fear and goes into the dark, is braver than a boy without that fear. As is easily seen, the second boy is not brave at all. And in the case of the supposed duel, a man who fears public opinion very much indeed, will fight rather than be counted a coward, and therefore is actually a coward. So, as you see, which is what I wish to point out, there is no *outward* mark by which we can affirm that a particular action is courageous or the reverse. But if you sit down and write a story in which a character is so well portrayed that the reader will see quite plainly that a man fighting to the death is doing it because of his cowardice, you will have made a story that will find a publisher in no time. Handle the theme well, and I promise you that you shall have no rejection slip. One of the stories that O'Brien listed as among the best in 1920 was based on this theme, though it pictured a suicide who coldly and deliberately swam to his death, not that he feared life, but because his conscience hurt him, he having once failed to kill a fellow who was a military brute.

Perhaps you have read Stockton's "Lady or the Tiger," a tale in which the reader is left wondering, is given something to think of. The effect upon the reader is something like the effect left after seeing Ibsen's "Doll's House." So it would be in a tale such as above outlined. The reader would ponder deeply, if indeed he would not be torn between two emotions. Did the fighter fight

because he did not fear death, or did he fight because he feared public opinion more than death? At first blush, you may say, "It is obvious that he was a coward." But, consider a moment. Is the average man given to subtle distinctions? For instance, during the war, when some went to jail for their opinions, were not many torn with conflicting ideas? Were pacifists brave? Were they cowards? Were they actuated by fear of death or were they courageous enough to defy public opinion and the charge of cowardice, to give up their own liberty and happiness for conscience sake?

Take another theme, or rather angle of the same theme. Suppose a character similar to the average man: somewhat timid, careful to keep within the bounds of the law, tied to his business hand and foot, his expenses keeping neck and neck with his income, anxious to avoid publicity of an unpleasant nature. Yet he is a thoughtful man and a law-abiding one, and, therefore, opposed to all forms of mob law. Moreover, like the most of us, he shrinks from physical pain, and cannot kill a chicken without a beating of the heart. We will also suppose that he is violently opposed to war. To him comes one day another, suspected by a lawless mob doing deeds of violence in the name of "patriotism." Call it the Ku Klux Klan, the American Legion, a Law and Order League or what you will. Although trembling, in an agony of terror, fearing for his own life, yet the character we have in mind shelters the fugitive.

Here you have the opposition between physical and moral courage. The searching mob seeing him pale and fearful would know him for an arrant coward, and he himself would certainly admit himself to be that. Yet, knowing his motive, we see that he was essentially brave, since his fear was subordinated by a conscious effort to the end in view.

I believe enough has been said to show why, if you would write a short story involving the exemplification of courage, it is not at all necessary to fall back upon brute force.

It is somewhat in this connection that I would lightly sketch a talk I had with a young writer who had submitted a story in which he outlined a "brave" feminine character—a woman who had faced a little mob. I had held that the mere fact of facing a mob, when a woman did it, was no great sign of courage. But the conversation had not a single beginning. We had talked of other things, and he had objected to a scene in the novel "*Dust*" in which *Martin* had seemed to hold a light regard for woman's comfort in the chapter in which *Rose* accused him of caring more for the welfare of a fine-blooded cow than for his own wife. *Martin*, you may remember, had held that altogether too much fuss was made by women, and sometimes men, about child-bearing—that it was a natural function just as is teeth growing. My young friend held that the whole scene was derogatory to American ideals of "womanhood." Then we looped back to his short story.

It seems to me that there is a great deal

of what the English call "tosh" about "womanhood." When *Martin* compared the cow with the women to the detriment of the latter, as far as fuss in the matter of young-bearing, he was obviously right. On first reading the passage there came to my mind Whitman's poem in which he tells of his admiration for the cattle in the field because they were so "calm and self-possessed." Like *Martin*, and Whitman, I hold that both men and women have much to learn from animals.

To touch on the other, and co-lateral branch of the subject of our conversation. I held that the act of the woman who stood in front of a little mob bent on mischief was an act apparently, but not really, involving danger. The same act performed by a man most certainly would be courageous, but not in the case of the woman, because she would bank upon popular opinion as to the weakness of her sex. The opinion was her protection. She well knew that the rioters would not club her, a woman, and it was her "womanhood" that she counted on to preserve her. Hers then was a spurious bravery. So also is the man-killing woman a fake heroine. A woman may shoot a man, especially in the case of a so-called seduction, with the chances all in her favor that she will never be found guilty of murder. Pose as a heroine as she will, yet she knows perfectly well that she may rely on the support of a clamorous, sentimental and often hypocritical section of public opinion.

VII.

PLOT AND PROBABILITY.

There seems to be little to be said as to plot. I note that the books of instruction, weighty affairs some of them, more than a third of which seems to be badly assimilated from some handbook of grammar, lay great emphasis on plot. I hold that the first and most important thing is to create a character. You will naturally create secondary characters and out of them a situation will grow, and the situation is the plot. But for the rest of it, I believe that an imaginative man will find ideas for stories in all kinds of odd and unsuspected little things. H. G. Wells has told us somewhere how he saw a leaf floating on a little pool and that leaf suggested a canoe, the canoe again suggesting a lone man. From that grew the story of Epyornis Island. Turning to other of his stories, you can certainly discover for yourself what may have been the germ of the idea. There is his fine "Country of the Blind," which every ambitious writer should read. You easily see that the tale grew out of a pondering over the saying, "In the country of the blind, the one-eyed is king." Again, thousands of men have watched hens scratching in a yard and to them has come the thought of wonder as to what would happen were men creatures of but an inch in stature, with other birds and beasts their present size. But it was Wells who conceived the notion of making a story out of it, and a

gorgeous story it is, as any one who has read "The Food of the Gods" will admit.

Then there is R. B. Cunninghame Grahame, king of short story writers, as I believe. I pick up a book of his tales. It is "Brought Forward." More properly they might be called sketches. I turn to the first at which the book opens. It is "With the North-East Wind," a brief but tremendously vivid account of the funeral of Keir Hardie. I wish you would read it for yourself. Grahame is a wonder. Never did a mind figure to itself with more exact detail or greater energy all the parts and tints of a picture. Read this, which is the opening paragraph:

"A northeast haar had hung the city with a pall of gray. It gave an air of hardness to the stone-built houses, blending them with the stone-paved streets, till you could scarcely see where the houses ended and the street began. A thin gray dust hung in the air. It colored everything, and people's faces all looked pinched with the first touch of autumn cold. The wind, boisterous and gusty, whisked the soot-grimed city leaves about in the high suburb at the foot of a long range of hills, making one think it would be easy to have done with life on such an uncongenial day."

And, while I promised to refrain from long quotations, I cannot but help giving you this from the same sketch, for it seems to me a remarkable description of a crowd of men. I call your attention to Grahame's way of doing it:

"John Ferguson was there, the old time Irish leader, the friend of Davitt and of Butt. Tall and erect he stood, dressed in his long frock coat, his roll of papers in one hand, and with the other stuck in his breast, with all the air of be-

ing the last Roman left alive. Tom Mann, with his black hair, his flashing eyes, and his tumultuous speech peppered with expletives. Behind him, Sandy Haddow of Parkhead, massive and Doric in his speech, with a gray woolen comforter rolled round his neck, and hands like the panel of a door. Champion, pale, slight and interesting, still the artillery officer in spite of socialism: John Burns; and Small, the miners' agent, with his close brown beard and taste for literature. Smilie stood near, he of the seven elections, and then check weigher at a pit. There too, was silver-tongued Shaw Maxwell and Chisholm Robertson looking out darkly on the world through tinted spectacles; with him Bruce Glasier, girt with a red sash and with an aureole of fair curly hair around his head, half poet and half revolutionary."

If you do not see that what I am insisting on is, after all, the main thing, that is the portrayal of character even in those few light touches, then my time is wasted writing this essay.

I turn to another page and find the sketch, "A Minor Prophet." It is the tale of a man moved to preach his gospel of Love and Fellowship, and he preaches on, enwrapped in his subject, quite oblivious of the fact that one by one his little audience leaves, and then:

"He paused, and, looking round, saw he was all alone. The boys had stolen away, and the last workman's sturdy back could be just seen as it was vanishing towards the public house.

"The speaker sighed, and wiped the perspiration from his forehead with a soiled handkerchief.

"Then, picking up his hat and his umbrella, a far-off look came into his blue eyes as he walked homewards almost jauntily, conscious that the inner fire had got the better of the fleshly tenement, and that his work was done."

A fine ending to a fine piece of writing, indeed. Yet for "plot" the story has nothing but a man moved to preach and finding no hearers. Again, in "The Bathers," by H. G. Dwight, you have a first class piece of work, but nothing happens except a brief wrestle. Yet the story is both stirring and dramatic. A hundred delicate shades of character and temperament are shown us. But set before the reader is the invisible world of inward inclinations and dispositions.

As for probability, or, if you will, plausibility, about both of which the instructors are anxiously concerned, I do not believe that consideration of either enters into the matter of acceptance by editors. Tell a good story, and whether it deals with pterodactyls or fays, devils or angels, it will stand on its own merits as a story. You have seen Wells bringing the world to an end in many different ways: you have seen him carving animals into the shapes of men (Island of Dr. Moreau), or causing angels to be shot (The Wonderful Visit), or leaping into the Fourth Dimension (The Story of Mr. Davidson's Eyes), or travelling into the year 30,000 (Time Machine), but always there is verisimilitude. We know that it cannot be true, the tale he tells, but we are willing to believe with him that it is true. For romance is a legitimate field. If you can imagine a rattling good fairy story, go to it. Mark Twain wrote a good tale about a microbe and Verne wrote a good one about a trip on a meteor to the farthest edge of the solar system. There is plenty of room in be-

tween these for you. True, just at this present moment the pendulum swings toward realism, or, if it has not swung, at any rate there is a mountain of realistic stuff on hand, but at any moment a fantastic romance may leap into favor. So close your ears to the short story professors with their warnings against improbability and all that kind of thing. Write what you feel you must write, for if you must write, you must, and if you are not impelled to writing, not all the reading of books, nor listening to lectures will aid you one whit.

VIII.

ON SEX.

William Marion Reedy said, "In literature just now it is sex o' clock." He was deploring somewhat the insistence upon sex and sex matters that seems to be fashionable. We had a good talk on that, and, presently, that outspoken, clear-minded writer, Frank Putnam, joined in. So there were three editors, neither of whom had puritanical notions, all pretty much in accord. We came to a rough kind of conclusion that there was distortion of a kind when matters of sex occupied too prominent a place in literature. Understand me, no one of us were other than gross in part ourselves, but we knew that the part that sex played in our lives was very small as compared with other things. In some ill-defined way it seemed that in literature it should bear about the same proportion that it does in

actual life. In life, there are women who sell themselves, men who seduce, women who attract seducers, and those who get into all kinds of trouble because of sex, and that being the case, it is folly to hide it, or to pretend that things are otherwise. A writer should not be mealy mouthed. But when there is an overinsistence upon sexual appetite, we are forced to believe that it can be explained only by the aberration of a perverted fancy. There is a happy medium between monsters of virtue all correct, constrained and charming, and human billy-goats. To be sure there is an impetuosity of the senses, an upwelling of the blood, but there is something else.

Unfortunately, nationally, we are given to false modesty. Perhaps it is the revolt against that which has made for this overinsistence on sex in literature. If so, it will eventually prove to have been a most excellent thing should it succeed in bringing us to our senses. For, as matters are, and according to the accepted standard of "respectability," we would give welcome to neither a Henry Fielding with his "Tom Jones," a Smollett, a Swift, a W. L. George, a Lawrence, a George Moore nor even a Shakespeare with his Sonnets. Much less could we have a Balzac, a De Maupassant, a Murger or a Moliere. As it is, we are debarred from much that is well worth while from the pens of foreign authors, while there is a very active underground trade, as every man knows, in stuff that is frankly pornographic.

IX.

SO THEY MARRIED AND—

Just now, I turned to a pile of common novels, the sort that is here today and gone tomorrow, and opened them at the last page. Somewhere there I found that "she floated into his arms," "the strains of the Wedding March were borne on an afternoon air," "You are the only one I have lived for," or some such sentence.

I also find that of ten short stories submitted for inspection, nine deal with the problem of getting a wife.

Now, as will be clear to every thinking man, the problems of life do not end with marriage. Rather do they begin with them. Marriage is not an ideal state, the end of grief, the solution of all problems. In fact, under present economic conditions, it is exactly what has been called an *egosime a deux*. To throw two people together, in everlasting close proximity, is a dangerous thing to do at any time, and in any conditions. The only possible amelioration is a community of intellectual interests between man and wife, which, as we know, is extremely rare. Lacking that, there must be frequent discontent. The two parties to the contract are thrown too much together. The feminine "moods" get on the nerves of the man. The very fact that convention prevents the man from having other female friends, and the woman from having male friends, ex-

acerbates the trouble. The two become more or less isolated and there is revolt—perhaps openly expressed, perhaps hidden. The first fierce sexual appetite being satisfied, “love” passes into coldness and by a natural transition, coldness into dislike. Then come children perhaps, and marriage sinks into a stern, indissoluble partnership with never ending worry and fret for the man, and unending petty toil for the woman. Utter boredom is called virtue and morality. A musty, fusty old pair, yawning in each other’s faces on a front porch in utter vacuity, are pointed out by the conventional as a model of contentment. A volume would not exhaust the list of troubles that come when the marriage state is entered. So, let us in writing, paint things as they are to the end that the young shall hold no illusions. Paint no idyllic picture of love in a cottage, nor present something that has but the remotest reference to life as it is.

Edward Carpenter, in his “Love’s Coming of Age” has much to say on this subject. The little book is packed full of sound common sense. Stories on the relations of the sexes that do not touch on the triangle feature have been written in plenty, and the *Smart Set* has had many good pages on the theme. But it has been overlooked by Americans, that William Makepeace Thackeray, a satirist second only to Swift, brought a consummate cleverness to bear on the subject. His married couples pass in review before the reader like a series of warnings. We read with amusement, to recognize with seriousness, moving

among us in life the very characters he portrays. We know his *Miss Blanche*, acting the martyr, eyes ever welling with tears, trying to catch a husband who will sympathize with her sensitive heart. We have seen a *Mrs. O'Dowd*, pompous and boastful and proud, bent on marrying every bachelor she can lay her hands on. We know *Amelias*, wildly jealous, leading a husband a devil of a time. We remember many like *Helen Pendennis*, silly country prudes of no education, full of the harshness of Puritanism. We recall decent women like *Lady Castlewood* married to drunken and imbecile boors, and by contrast, high-strung fellows tied to women who have the minds and the education of a kitchen maid. There are families of *Pontos* yawning in solitude, men whose acquaintances are too vulgar for their wives, and wives who scorn their husbands. . . . Go to Thackeray if you would write, and, when tempted to dismiss your characters with the reflection that marriages are made in Heaven, bear in mind that if such was the case, Heaven was often a bad workman as far as generating earthly happiness is concerned.

XI.

SAMPLE SUBJECT SUGGESTIONS.

Whether I was born with a crooked streak, or whether much travel in odd corners of the world and living with odd people has given me a kind of twist I do not know. Some times I am very sorry for myself: but I cannot see things in the way people tell me I

should see them. The worst of it is that this disability of mine places a bar between me and my fellows more often than not. For instance, I cannot see anything very noble, elevating or inspiring in the ritual of secret societies. The "good lessons" that others tell me are to be learned in the hidden arcana, I never find. I draw the most extravagantly wrong inferences from the ritual. Whenever I hear public speakers say nice things which seem to please my neighbors, my mind goes off at a tangent in a kind of examination as it did the other day when I read a story in which much stress was laid on southern hospitality. I very much doubted that there was in the south any more hospitality than in the north, or the east, or the west. Tramping the roads of the south as I often do, I find that one autoist out of twenty-five or so will offer to carry me to the next town. That is about the proportion I found in the north. Of course, in the south, exactly as in the north, where advantages are to be gained, or where favors are to be expected, there is a rush to do honor. If I am known as a writing fellow, I am taken to see the show places, the local sights, the scenic views. But if I happen along dressed as a common laborer, I meet no more hospitality in the south than anywhere else. The watchdog south of the Mason and Dixon line is as unfriendly as his cousin in Ohio or Minnesota. I tell this, not by way of persuading you to my viewpoint, but so that you shall examine at first hand some of the notes which I have made from time to time as bases for prospec-

tive short stories. Given time, I shall make stories around them myself, but, if you beat me to it, well and good. My mental attitude in this respect is much like the hen who cackles when she has laid an egg. She has produced the potential chick, if foster mothers make it actual, well and good. So, if you make a story of any one of these, you have my benison.

First. I read a lecture by Conan Doyle in the course of which he assured us that on the other side of the veil we shall meet our soul mates. Soon after that appeared in print, I had no less than five manuscripts of stories based on the idea that although lovers were separated here, there would be a ringing of bells in heaven when they rushed together, with an eternity before them.

Now it seems to me that some of us who have had experiences, and, in the course of time have been happily delivered from our affinities, would not be elated over the prospect that Doyle sets before us. There's a story there.

Second. A fairly well-written pamphlet foretold a time when Labor, uprising in its might would put all executives to work with pick and shovel, hammer and saw, when the day of rejoicing would be at hand.

My note on this would suggest a story to the effect that a couple of dozen really first-class executives drawn from capitalistic enterprises, and paid a higher wage than they could hope for in their old jobs, would marshal the forces of Labor and win for it the victory it craves. The story would go on to show that Labor is

not willing to undertake the sacrifice that would lead to victory: that it is mistrustful and too prone to treat its own friends with coldness, denunciation, ridicule, suspicion; that it is too prone to hot air and sentimentality. The conclusion would be drawn as a salutary lesson to Labor, that while Capital measures all things by dollars and cents, it is not too stingy to pay a good price for what it wants. Consequently it wins, for money gets the man.

Third. An editorial told of the good time coming when Labor and Capital shall meet face to face.

I do not believe in any such good time, and would do all in my power to prevent such a meeting. My reasons would be that in the past, Labor and Capital have met face to face, and the clash of countenances was like unto that when two rams meet, both of whom are enamoured of the same ewe. I project a story then setting that forth, with the ultimate decision arrived at that Capital admits it must get all that it can at the lowest price, and Labor must get all it can at the least exertion cost. Under such circumstances, it is idle to hope for agreement, and my story should show both parties putting aside camouflage and agreeing on the issue.

Fourth. In a secret society, I heard a national official talk for an hour or more on the elevating influence of lodge work, praising the members present for their attention to duty.

My story would show that most men attend lodge as a refuge and a hiding place, to escape the boredom of home, wife and children and

that lodge work was really nothing but solemn play, and neither religion nor a substitute for it.

Fifth. In high wrath, a man wrote a letter to a local paper denouncing the editor for the stand he had taken. The man then felt that he had stung the editor, and imagined him squirming under the blows received.

Write a story showing that under such circumstances a newspaper editor is highly pleased, for the objecting letter shows him that for once the bombastic nonsense he has written was read.

IX.

ON STYLE.

On the subject of style, the authors of books telling how to write, flounder solemnly. They remind me very much of Van Vechten's tale of the rather massive female who tried to explain a cubistic production to an outspoken doubter and coming a cropper in the effort, proved that she knew nothing about the subject. The said doubter had declared that "There's always a lot of talk, but nothing is clear." And it is exactly so when self appointed instructors arise to explain "style" in literature.

Perhaps if you get this into your mind it will serve. To tell a story, two persons are involved—a writer and a reader. It is the business of the writer to win, *to persuade the reader*. All the rest follows. The writer must choose the clearest way, the nearest way, the

most pleasant way. His manner of doing that is his style.

Next, how shall style be attained? Take Thoreau for your teacher in this. He said: "If you have anything to say it will fall from you as a stone falls from your hand." You know that is true. Of course, different men will have different ways of expressing themselves just as they have mannerisms in their daily acts. But we must remember that one man's style will not fit another man. Imitation is idle. That is all I can tell you about style. I could wrap what I have said above into a cloak of ornamental language or cover it layer upon layer with elaborations as the layers of an onion are about a central core, but could say nothing else of value. Still, as many books have been written on the subject by master minds, and as I have those books on my shelves, I shall give you in the paragraph that follows, some idea of what stylists have to say, and, that being done, shall copy for you certain passages from books not very popular and therefore hard to get at, so that for yourself you may see the extraordinary differences in style.

Take Schopenhauer's view. It is to be found in his *Parerga*.

"Every mediocre writer tries to mask his own natural style. . . . If they would go honestly to work, and say, quite simply, the things they have really thought, and just as they have thought them, these writers would be readable and, within their own proper sphere, even instructive.

"But instead of this they try to make the reader believe that their thoughts have gone

much further and deeper than is really the case. They say what they have to say in long sentences that wind about in a forced and unnatural way; they coin new words and write prolix periods which go round and round in the thought and wrap it up in a sort of disguise. They tremble between the two separate aims of communicating what they want to say and of concealing it. Their object is to dress it up so that it may look learned and deep, in order to give people the impression that there is very much more than for the moment meets the eye." And again: "The first rule for good style is that the author should have something to say."

The English novelist, Sir Arthur Quiller-Couch, in a lecture delivered at the University of Cambridge, has this to say: "As technically manifested in literature it (style) is the power to touch with ease, grace, precision, any note in the gamut of human thought or emotion."

Next take the Frenchman, Comte de Buffon. It was he who said: "The style is the man himself." I think you will understand and enjoy the passage that follows:

"But when he has made a plan, when once he has brought together and put in order all the thoughts essential to his subject, he will see easily the instant when he ought to take up his pen, he will feel with certainty that his mind is ready to bring forth, he will be pressed to give birth to his ideas, and will find only pleasure in writing; his ideas will succeed each other easily, and the style will be natural and ready; the warmth born of this pleasure will diffuse itself everywhere and give life to each expression; the animation will become higher and higher; the tone will become exalted; objects will take on color; and feeling blended with intellect will increase the warm glow, will carry it farther, will make it pass from that which one says to that which one is about to say, and the style will become interesting and luminous."

I cull this for you from John Ruskin:

"So long as no words are uttered but in faithfulness, so long the art of language goes on exalting itself; but the moment it is shaped and chiselled on external principles, it falls into frivolity, and perishes." . . . "No noble nor right style was ever yet founded but out of a sincere heart." . . . "No man is worth reading to form your style, who does not mean what he says; nor was any great style ever invented but by some man who meant what he said."

Now here Thoreau again:

"We are often struck by the force and precision of style to which hard working men, unpracticed in writing, easily attain when required to make the effort. As if plainness and vigor and sincerity, the ornaments of style, were better learned on the farm and in the workshop than in the school."

Reading that, consider Jack London the virile, Robert Burns the boy on the stone bruised farm, John Bunyan the tinker, Masefield the sailor and bartender, W. H. Davies the hobo, Caradoc Evans the boy who was always hungry and tired. The last named mastered English through the study of the Bible. The passage below is taken from his book, "My Neighbors." Except perhaps Bunyan, no better example could be given of sheer force and precision of style.

"Our God is a big man: a tall man much higher than the highest chapel in Wales and broader than the broadest chapel. For the promised day that He comes to deliver us a sermon, we shall have made a hole in the roof and take down a wall. Our God has a long, white beard, and he is not unlike the Father Christmas of picture books. Often He lies on his stomach on the Heaven's floor, an eye at one of his myriad of peep holes watching that we keep his laws.

Our God wears a frock coat, a starched linen collar and a black necktie, and a silk hat, and on the Sabbath He preaches to the congregation of Heaven.

"Heaven is a Welsh chapel: but its pulpit is of gold, and its walls, pews, floor, roof, harmonium, and its clock—which marks the days of the month as well as the hours of the day—are glass. The inhabitants are clothed in white shirts in which they were buried and in which they arose at the Call: and the language of God and his angels and of the Company of the Prophets is Welsh, that being the language spoken in the garden of Eden and by Jacob, Moses, Abraham, and Elijah.

"It is no miracle that we are religious. Our God is just behind the preacher, and He is in the semblance of the preacher and we believe in Him truly. It is no miracle that we are prayerful. Our God is by us in our haggings and cheatings. Bacca Pehffos prays that the dealers' eyes are closed to the disease of her hen; Shon Porth asks the Big Man to destroy his pregnant sister into whose bed Satan enticed him; Ianto Tybach says: 'Give me a nice bit of haymaking weather, God bach. Strike my brother Enoch dead or blind and see I have his fields without any old bother. A champion am I in the religious and there's gifts I give the preacher. Ask Him. That's all.'

Now consider a very different style. It is from Charles Lamb who came nearer achieving perfection than anyone in literature. His art is so cunningly concealed that it has the appearance of almost careless discourse.

"I am no Quaker at my food. I confess I am not indifferent to the kinds of it. Those unctuous morsels of deer's flesh were not made to be received with dispassionate services. I hate a man who swallows it, affecting not to know what he is eating. I suspect his taste in higher matters. I shrink instinctively from one who professes to like minced veal. There is a physiological character in the tastes for food.

C— holds that a man cannot have a pure mind who refuses apple dumplings. I am not certain but he is right. With the decay of my first innocence, I confess a less and less relish daily for those innocuous cates. The whole vegetable tribe have lost their gust for me. Only I stick to asparagus, which still seems to inspire gentle thoughts."

At this point I spent a full half hour trying to hit upon a paragraph for reproduction here from Stevenson's "Virginibus Puerisque." But without success. You can no more tear a paragraph from that admirable essay than you can take a jewel from its setting and have the thing as it was. So you must turn to his essay for yourself. You should also read his "Travels with a Donkey." And, while you are about it, do not forget to read much of De Quincey, and also of Goldsmith.

X.

A NEGLECTED FIELD.

There is opportunity in full, a vast field to exploit in the writing of juveniles, to use the term applied to that branch of literature which appeals to the young. It is especially the case in stories appealing to growing girls who, having passed from the excellent *John Martin's Book* stage and into the *St. Nicholas* age, are unwilling to leap forthright into Gene Stratton Porter and Harold Bell Wright. In England, and imported into the eastern states, there used to be a well edited journal called the *Girls' Own Paper*, but it is imported no

longer. No one has quite taken the place of Louisa May Alcott, or Margaret Sidney with her Pepper Series.

Good stories for boys too are comparatively rare, though the *Youth's Companion*, leader in this field, pays well, is well edited and widely read. Lads of a past generation fared far better for reading matter than those of today. There was a border land as it were, a literature that interested men as well as boys of spirit. The work of Jules Verne, so admirably translated, is with us and our publishers, sadly neglected. His books, together with the stories of adventure by Paul de Chailu, led millions of lads to higher reading planes. Then there was Harrison Ainsworth with his semi-historical fiction, Ballantyne with his short tales of fire-fighters, sailors, lifeboat men and others in adventurous callings, and Thomas Hughes and his host of followers with bright school-boy tales. England has some good work in that direction today, especially in what is being done by Henry Newbolt who writes of old warriors and new, of deeds of derring-do and wild adventure, nor should we omit Frank T. Bullen with his "Cruise of the Cachalot" and other tales, or Basil Lubbock, fit successor to Dana. I particularly urge ambitious writers to look into this field of literature. Our lads today are fed up to nausea with tales of Boy Scouts, square-chinned lads who, single-handed, routed German regiments, captains of industry in embryo, amateur detectives and all that sort of thing. What we need, is, not to

try to rob boyhood of its golden days and to thrust ideas of business success into them, but to offer them food for lively imaginations. Give them reading for reading's sake and not for some ulterior motive. Boys do not want "lessons" in books any more than they need "lessons" in a ball game. There is where I would take issue with Franklin K. Matthews of the Boy Scout movement who, not so long ago at a publishers' convention, said that there was a great field for exploitation in the ten million boys hungry for reading matter. So far so good, but, urging publishers to cultivate this field, he quoted the wife of a college professor with approval who had expressed her desire to "do something to keep the boys sensibly occupied on Sunday afternoons" and had added that "parents do not believe in dare-devil books which would be of interest to boys."

Now I hold that if we are to raise a generation of readers, we must do exactly contrary to that which is here suggested. Consider. If you read the Matthews' quotation with care, you catch a faint and fusty flavor that recalls "best" rooms with cloth-covered round tables bearing books set at mathematically arranged distances apart, radiating from a center of imitation fruit, done in wax, covered with a glass shade. You will also get a sense of a prim lady handing you a copy of Samuel Smiles' "Self Help," with the injunction, "Be good, because it's Sunday."

With no respect whatever for anyone's opin-

ion, when Mr. Matthews and the wife of a college professor, together with the objecting parents attempt to exercise surveillance over the boy's reading, and affect the illimitable conceit that they know what is, and what is not, proper, they not only stultify themselves, but proclaim themselves the enemies of boys, and, further, take the first step towards disrupting an organization that has a power for good—an organization that so far has not been captured for ulterior motives. Frenzied with the fashionable fever for prohibition, they rush to join that

Sect whose chief devotion lies
In odd, perverse antipathies:
In falling out with that or this
And finding somewhat still amiss.

Sturdy of growth though the Boy Scout movement is, be sure that any repentant Puritanical interference will most assuredly result in labefaction.

A boy is an unspoilt man, and these are the elements that enter into his character: enthusiasm, fervor, courage and generosity. A boy is both unmoral and unreligious. He has a sublime contempt of custom and of conventionality, and is almost destitute of selfishness. Moreover, he is assured of his right to his own opinion and the correctness of his own choice. That he is a chosen instrument for the emancipation of the human race: that he, once untrammelled, can achieve the triumph of justice over centuries of oppression; that,

once attaining manhood, he will right all wrongs, he is as certain as he is of his own existence. His heroes, he insists, shall be endowed with similar qualities. Further, and this Mr. Matthews and the college professor's wife, with objecting parents, should mark well, the average, normal boy has a deep conviction that parents, preachers and teachers are narrow-minded old fogies, either eternally shamming or showing off, utterly destitute of originality, and full of silly prejudice. The boys are not far wrong. Therefore, the obnoxious officiousness—but what's the use.

As to dare devil books, can any normal, sensible man, not a *Stiggins*, a *Pecksniff*, or a *Uriah Heep*, put his finger on any book of that class, that he read when a lively boy, and say, "If I had not read this, I would have been a better, wealthier, healthier man; I would today have been saner, holier, wiser?" Can any reading man who has lived with those gallant dare-devil creations that he learned to love and admire before he knew *Becky Sharp* or *Hester Prynne*, or *Corporal Trim*, say that he would willingly obliterate the memory of any one of them? On the other hand, mentally reviewing an imaginary parade of boyhood heroes, does not one's heart beat quicker, does there not come a thrill of joy as the golden days before disillusionment are recalled?

Picture the procession! It will do you good. No Barnum and Bailey amalgamation of circuses can match, nor civic pageant pale it.

The great iron gates of the boys' Valhalla fly open with a clang, and the lank-jawed, pestiferous prohibitionist flees before the noble throng. All brave in their Lincoln green, *Robin Hood* and his merry men lead the way. You see *Friar Tuck* and *Little John*, *Will Scarlett*, and *Alan-a-Dale*. *Jack Shephard* follows, keen eyed and lithe, a merry rogue laughing at shackles and handcuffs, to whom Houdini is but a pale ghost. *Dick Turpin* too is there astride of his bonny *Black Bess*, and *Claude Duval* the gallant, with *Cartouche*, and *Monte Cristo* mysterically visible in his sack. Captain Kidd with blood stained bandage marches with Jesse James and the Younger brothers, and *Phileas Fogg* the imperturbable, unsmiling and resolute, touches elbows with John L. Sullivan and Jake Kilrain. *Quasimodo* comes, and George the runner and Beach the oarsman, *Long John Silver* and old man Pew, *Gagool* and *Natty Bumppo*, *Gordon Pym* and the Man in the Iron Mask, *Allen Quatermain* and Gaborieu's detectives. Covered with yellow dust of New Mexico, glittering with silver and gold, ride the immortal Scalp Hunters and the plainsmen of Captain Mayne Reid, while the *Iron Pirate* and *Jack Harkaway* go arm in arm. Sailors, fire fighters, cowboys, whalers, smugglers thicker throng. Spears, banners, bayonets, lassoes, boledores, battle axes and marlinspikes bristle above massed heads. Wild, strange oaths fill the air. Steel clashes on steel. Then comes a crowd of heroes so compact that with difficulty you pick out one here and there—trim *Midshipman Easy*,

Harry Lorrequer, Peter Simple, Handy Andy, Percival Keene, Baron Munchausen, Ned Kelley the iron clad Australian bush ranger, *Tracy* the outlaw, *Valentine Vox*, Peace the burglar, *Athos, Porthos, Aramis*, the *Wandering Jew*. Not a woman, not a seducer, not a pestilential prohibitionist in all that glorious, golden, glittering galaxy. Not a saint, a statesman or an uplifter there. Not one could you find to be accused of injustice, of prejudice, of narrow mindedness. Not one but would leap to quarter-staff, to bow, to mace, to dirk, to pistol or musket in defense of liberty and freedom. Not a solitary religious character would you find, except it be Sampson, admitted by reason of his house-wrecking activities.

By all the gods, if this little book shall result in but one rattling good short story, one real good tale of adventure, just one good story for boys that are boys, and not tight fisted men before their time, the writing of it shall have been well worth the while and Mr. Halde-man-Julius will have conferred a benefit on his generation by publishing this. So go to it if you can. Forget "moral lessons," "improvement of the juvenile mind" and all that nonsense and give the best that is in you.

YOUR MARKET.

Use common sense when sending your manuscript. Read the magazines and mark the kind of story they use. For example, should you have a story dealing with the *egoism a deux* called marriage, it would be of no use to send

it to the *Saturday Evening Post*. Similarly, a tale of business success would find no friendly reception in the office of the *Dial*.

There are many magazines, especially the younger ventures, exceedingly hospitable to unknown writers. I name the *Double Dealer*, Vincent Starret's *Wave*, the *Reviewer*, and *Broom*.

For established magazines with editors very much on the *qui vive* for good work, watch the *Century*, *Smart Set*, *Little Review*, *Freeman* and *Midland*. There are probably many others, but I'm speaking from my own experience.

I would advise you to read the editorials and literary criticisms of H. L. Mencken in the *Smart Set*, Glen Frank in the *Century*, and if you care for this, my own periodical "*All's Well*."

There follows a very complete list giving the addresses of magazines using short stories.

Adventure, Spring and Macdougall Sts., New York City.

Ainslee's Magazine, 79 7th Ave., New York City.

All's Well, Fayetteville, Ark.

American Boy, 142 Lafayette Blvd., Detroit, Mich.

American Magazine, 381 Fourth Ave., New York City.

Argosy All-Story, 280 Broadway, New York City.

Asia, 627 Lexington Ave., New York City.

Atlantic Monthly, 8 Arlington St., Boston, Mass.

Black Cat, 229 West 28th St., New York City.

Broom, 3 East 9th St., New York City.

Catholic World, 120 West 60th St., New York City.

Century, 353 4th Ave., New York City.

Collier's Weekly, 416 West 13th St., New York City.

Cosmopolitan Magazine, 119 West 40th St., New York City.

Dial, 152 West 13th St., New York City.

Double Dealer, 204 Baronne St., New Orleans, La.

Everybody's Magazine, Spring and Macdougall Sts., New York City.

Freeman, 32 West 58th St., New York City.

Good Housekeeping, 119 West 40th St., New York City.

Harper's Bazaar, 119 West 40th St., New York City.

Harper's Magazine, Franklin Square, New York City.

Hearst's Magazine, 119 West 40th St., New York City.

Holland's Magazine, Dallas, Tex.

Ladies' Home Journal, Independence Square, Philadelphia, Pa.

Liberator, 34 Union Square East, New York City.

Little Review, 24 West 16th St., New York City.

Little Story Magazine, 714 Drexel Bldg., Philadelphia, Pa.

Live Stories, 35 West 39th St., New York City.

McCall's Magazine, 236 West 37th St., New York City.

McClure's Magazine, 76 Fifth Ave., New York City.

Magnificent, Manchester, N. H.

Metropolitan, 432 4th Ave., New York City.

Midland, Glennie, Alcona County, Mich.

Munsey's Magazine, 280 Broadway, New York City.

Outlook, 381 5th Ave., New York City.

Pagan, 7 East 15th St., New York City.

Parisienne, 25 West 45th St., New York City.

People's Favorite Magazine, 79 7th Ave., New York City.

Pictorial Review, 216 West 39th St., New York City.

Popular Magazine, 79 West 39th Ave., New York City.

Queen's Work, 626 North Vandeventer Ave., St. Louis, Mo.

Reviewer, 809½ Floyd Ave., Richmond, Va.

Saturday Evening Post, Independence Square, Philadelphia, Pa.

The Red Book Magazine, North American Bldg., Chicago, Ill.

Scribner's Magazine, 597 5th Ave., New York City.

Short Stories, Garden City, Long Island, New York City.

Smart Set, 25 West 45th St., New York City.

Snappy Stories, 35 West 39th St., New York City.

Sunset, 460 Fourth St., San Francisco, Calif.

Today's Housewife, Coopertown, N. Y.

Top-Notch Magazine, 79 West 47th Ave., New York City.

Toutchstone, 1 West 47th St., New York City.

The Woman's Home Companion, 381 4th Ave., New York City.

Woman's World, 107 South Clinton St., Chicago, Ill.

A word in conclusion. Keep your ears open as well as your eyes. You will find it pays to be somewhat of what Shakespeare called a "snapper up of unconsidered trifles." On every side of us, good things are being said, characters are being revealed. It was but last week when saying something to a lad who was plowing, I being sorry for what I took to be very hard work, he said:

"Why, I love it—turning up the sod, seeing the different things coming up all the time, the smell of the earth, hearing the purr of the plow and the little grunts of the horses—it's fun."

If you do not see strength and ecstasy and philosophy in that, you are hopeless.

At a meeting, I heard a business man say:

"Although there was a talkative crowd there, I ate silently, revolving plans."

The five words "I ate silently, revolving plans" presents a picture. An inexperienced writer might waste words in vain putting the idea across to a reader that a man engrossed in his business withdrew from the confusion about him. Observe, the conversation of men is not often clear cut, sharp chiseled. Too often it is a macedoine of tautologies, contradictions, slang and inaccuracy, but let a man think strongly on any one thing, and ten to one what he has to say comes out clear cut. It is the flake of gold in the midst of much gravel that you must learn to catch.

I find this again in my notebook. Two girls were talking in a street car and I could not but help overhear. It was poor stuff and uninteresting, with much of "I says" and "says he to me" and "I says, says I" but in one place this came like a bright light:

"I did not hear the reply, because of the faint rustle of my own movements."

The sentence stands perfect. What it conveys could not be better put.

Once I heard an old sailor telling a tale. He was full of oaths and obscenities and he wandered in the telling of it. Then this came:

"As the sun sank, a patch of trees on the point stood out against the light and it seemed that they had come by magic."

A Texas freighter I heard say of a man:

"He had the gift of friendship."

This was said by a child of seven years: "She was so proud, that she became white and tight lipped."

If you will examine the examples given, you will see that each speaker had something to express, and expressed it directly. There was no stuffing, no padding.

As an example of positive flash of insight, I copy this from the story "Villette" by Currer Bell:

"The cook, in a jacket, a short petticoat, and sabots, brought me supper, to wit, some meat, nature unknown, served in an odd and acid but pleasant sauce; some chopped potatoes made savory with I know not what, vinegar and sugar, I think; a tartarine or slice of bread and butter and a baked pear. Being hungry, I ate and was grateful."

The passage that next follows, I find in my scrap book clipped from *T. P.'s Weekly*. It is the opinion of an old grayheaded man at Rydal Mount who remembered Wordsworth and who, in spite of the evidence of many poems, held that the Lake poet had no interest in children.

"He never cared for childer, however; yan may be cartain of that, for didn't I have to pass him four times in t' week, up to the door wi' meat: and he niver onest said owt. Ye're well aware if he'd been fond of children, he 'ud 'a spoke."

Now watch how Mark Twain does things. His Huckleberry Finn talks as the boys that you know talk, and, like so many of the unlearned, he supports his views with a phil-

osophical tag. He is giving his opinion of the *King* and the *Duke*, two rascallions who were parasites on the lads.

"It didn't take me long to make up my mind that these liars wasn't no kings and dukes at all, but just low down humbugs and frauds. But I never said nothing, never let on; kept it to myself. It's the best way; then you don't have no quarrels and don't get into no trouble."

And this, for scenic description in miniature, with a record of personal impression is hard to beat:

"It was a-kind of solemn, drifting down the big, still river, laying on our backs looking up at the stars; and we didn't feel like talkin' loud and it wasn't often that we laughed, only a little kind of a low chuckle."

One more passage I must quote from *Huckleberry*. Compare it with the brief remark of the plowboy I copied for you, for Huck might have said what that lad said, or that lad might have talked as did Huck:

"Not a sound anywheres—perfectly still—just like the whole world was asleep, only sometimes the bullfrogs a-clattering maybe. The first thing to see, looking away over the water, was a kind of dull line—that was the woods on t'other side—you couldn't make nothing else out; then a pale place in the sky; then more paleness; spreading around; then the river softened up, away off, and warn't black any more, but gray; you could see little dark spots driftin' along, ever so far away—tradin' scows an' such things; and long black streaks—rafts; sometimes you could hear a sweep

screaking; or jumbled up voices, it was so still, and sounds come so far; and by and by you could see a streak on the water which you know by the look of the streak that there's a snag there in the swift current which breaks on it and makes that streak look that way."

Perhaps, if you have never tried to write a story, you will think that it is an easy task to put into the words of an unlettered lad a description such as that. But try. If you can come anything near it you will do well. If you can do as well as that your future as a writer is assured. Doubtless, you as a boy loved the still and solemn night, the creatures in the woods—squirrels, turtles, snakes. Doubtless, you too looked with indignation upon the things men did around you. If so, you have the foundation for a story within you. All that remains to be done then is to set down your own experiences without holding back, without exaggeration—to set down the things as they were in simple, plain words; to remember, all the time, that truth is the final test of literature.

THE FAMOUS EXAMINATION OF BRYAN AT THE SCOPES EVOLUTION TRIAL

FOREWORD

The state of Tennessee passed an anti-evolution law, forbidding teaching in public schools that man is descended or has evolved from lower forms of life. John Thomas Scopes, a teacher, was accused of violating this law, and was tried; ultimately he was found guilty and fined \$100. He was guilty, that is, of violation of the law in its literal sense, which was not concerned with the scientific truth or untruth of evolution.

The trial took place in Dayton, Tenn., from July 10 to July 21, 1925. The eyes of the world were fixed upon the Dayton courthouse for those twelve days. Attorneys for the defense were the eminent Clarence Darrow, Arthur Garfield Hays, and Dudley Field Malone. The judge who tried the case was John T. Raulston. William Jennings Bryan was present, as a devout element in the prosecution. It was on July 20th that Clarence Darrow put Mr. Bryan on the witness stand, and cross-examined him: a cross-examination that went down in legal history as one of the most remarkable ever conducted, and which made Bryan the laughing-stock of every educated person. So alluring was the scene of the trial that many famous people were present besides those taking part, including H. L. Mencken and E. Haldeman-Julius.

Attorney-General Stewart, prosecuting the

4 FAMOUS EXAMINATION OF BRYAN

case for the state, was assisted by Gen. B. G. McKenzie, his son, J. G. McKenzie, and several other lawyers. A preacher opened each day's session with prayer—a procedure which was a point of controversy during the trial.

The cross-examination of William Jennings Bryan—which was not before the jury, since the Court (Judge Raulston) ruled that the evidence was not relevant, but allowed it to be written into the record—was intended to show that the Bible was open to wide and liberal interpretation. Darrow's entire effort was directed to show that the Bible was not accepted literally even by the Fundamentalist Bryan. This point was important, since the anti-evolution law was based on a literal interpretation of the Bible, word for word, as in the accepted (usually King James) version. The day following the cross-examination of Bryan, Judge Raulston, a pious Fundamentalist, reconsidered his action in permitting the examination to go on. He came to the conclusion that the cross-examination was improper evidence to go into the record, and ruled that it should be expunged.

A complete picture of the Scopes trial, and Clarence Darrow's part in it, is given in *Clarence Darrow's Two Great Trials*, by Marcet Haldeman-Julius (Big Blue Book No. B-29). The life of Bryan is available, also, in the Little Blue Book entitled *The Truth About William Jennings Bryan* (Little Blue Book No. 1072). The scientific facts about evolution are available in several Little Blue Books, listed in any catalog.

THE EXAMINATION

Mr. Darrow: Your honor, before you send for the jury, I think it my duty to make this motion. Off to the left of where the jury sits a little bit and about ten feet in front of them is a large sign about ten feet long reading, "Read-Your Bible," and a hand pointing to it. The word "Bible" is in large letters. I move that it be removed.

Gen. McKenzie: If your honor please, why should it be removed? It is their defense and stated before the court, that they do not deny the Bible, that they expected to introduce proof to make it harmonize. Why should we remove the sign cautioning people to read the Word of God to satisfy the others in the case?

J. G. McKenzie: If your honor please, I believe in the Bible as strong as anybody else here but if that sign is objectionable to the attorneys for the defense, and they do not want to be repeatedly reminded of the fact that they should read their Bible, I think this court ought to remove it.

Mr. Malone: Your honor, I do not think that is the statement of the position of the attorneys for the defense. We are trying a case here which we believe has very definite issues and aspects; we believe even though the court has moved downstairs for safety and comfort, that everything which might possibly prejudice the jury along religious lines, for or against the defense, should be removed from in front of the jury. The opinions of the mem-

6 FAMOUS EXAMINATION OF BRYAN

bers of the counsel for the defense, our religious beliefs, or Mr. Darrow's nonbelief, are none of the business of counsel for the prosecution. We do not wish that referred to again. The counsel for the defense are not on trial here. Mr. Scopes here is on trial and we are merely asking this court to remove anything of a prejudicial nature that we may try these issues, and, so the court will be taken out of a prejudicial atmosphere. (*Applause.*)

Mr. Bryan: If the court, please—

The Court: Col. Bryan, I will hear you.

Mr. Bryan: May it please the court, very often in the course of a trial, questions come up which may be decided on one of several grounds. One is the ground as to what is right. There are certain technicalities that are sometimes observed, and then there are decisions made in the spirit of accommodation. I cannot see that there is any inconsistency, even subtechnically, about taking that "Bible" up there off for the defense, if the defense insists that there is nothing in evolution that is contrary to it. (*Applause.*) If their arguments are sound and sincere, that the Bible can be construed so as to recognize evolution, I cannot see why "Read Your Bible" would necessarily mean partiality toward our side. It seems to me that both of us would want to read the Bible if both of us find in it the basis of our belief. I am going to quote the Bible in defense of our position, and I am going to hold the Bible as safe, though they try to discard it from our wall. Paul said: "If eating meat maketh my brother to offend,

AT THE SCOPES EVOLUTION TRIAL

I shall eat no meat while the world lasts." I would not go that far—that is, I would not say while the world lasts, but if leaving that up there during the trial makes our brother to offend I would take it down during trial.

Mr. Darrow: Let me say something. Your honor, I just want to make this suggestion. Mr. Bryan says the Bible and evolution conflict. Well, I do not know, I am for evolution, anyway. We might agree to get up a sign of equal size on the other side and in the same position reading, "Hunter's Biology," or "Read your evolution." This sign is not here for no purpose, and it can have no effect but to influence this case, and I read the Bible myself—more or less—and it is pretty good reading in places. But this case has been made a case where it is to be the Bible or evolution, and we have been informed by Mr. Bryan, who, himself a profound Bible student, has an essay every Sunday as to what it means. We have been informed that a Tennessee jury who are not especially educated are better judges of the Bible than all of the scholars in the world, and when they see that sign, it means to them their construction of the Bible. It is pretty obvious that it is not fair, your honor, and we object to it.

Mr. Bryan: I am sure the gentleman does not mean to misrepresent me, but if he will get the record he will find that he has misquoted me.

Mr. Darrow: I am sorry if I did. Perhaps I did.

Mr. Bryan: I said any of the scholars whom

the defense could or would call—that is different from the statement as made by the gentleman. Besides, the gentleman's statement is not pertinent. He said he would put up "Hunter's Biology." We are not both swearing by Hunter's Biology. We are swearing by the Bible, if we can accept in good faith what the defendant has said.

Mr. Darrow: Oh, no, there is a variance.

The Court: The issues in this case, as they have been finally determined by this court, is whether or not it is unlawful to teach that man descended from a lower order of animals. I do not understand that that issue involves the Bible. If the Bible is involved, I believe in it and am always on its side, but it is not for me to decide in this case. If the presence of the sign irritates anyone, or if anyone thinks it might influence the jury in any way, I have no purpose except to give both sides a fair trial in this case. Feeling that way about it, I will let the sign come down. (*The sign was removed.*)

Mr. Hays: Your honor will remember that in my argument the other day I insisted there was no such thing as the Bible, that there are many bibles; but the court took judicial notice that the King James' version was the Bible. The court has the right to take judicial notice of other bibles, and I will ask the court to admit in evidence a translation of the Holy Bible from the Vulgate, which I understand is the Catholic Bible, as evidence in this case.

The Court: Let it be filed.

Mr. Hays: Your honor, we wish to introduce as evidence, likewise, the Hebrew Bible; and

we are going to ask that the first two chapters, likewise, be regarded as in evidence. And we believe we can show, through these translations we wish read into the record, that the Bible was not accurately translated into English, and of particular interest on the question of evolution. We have a right to do so to this extent: That if it should appear that the Catholic Bible is different in any part from the King James version, or that the Hebrew Bible is different in any part from the King James version, we have a right to show it. We should be permitted, in our argument, to show that there is a difference, and that it is not merely interpretative.

The Court: The question is whether or not Mr. Scopes taught men descended from the lower order of animals.

Mr. Hays: And whether or not that is contrary to the theory in the St. James version.

The Court: No, not—

Mr. Hays: The defense desires to call Mr. Bryan as a witness, and, of course, since the only question here is whether Mr. Scopes taught what these children said he taught, we recognize what Mr. Bryan says as a witness would not be very valuable. We think there are other questions involved, and we should want to take Mr. Bryan's testimony for the purposes of our record, even if your honor thinks it is not admissible in general, so we wish to call him now.

The Court: If you ask him about any confidential matter, I will protect him, of course.

Mr. Darrow: I do not intend to do that.

The Court: On scientific matters, Col. Bryan can speak for himself.

10 FAMOUS EXAMINATION OF BRYAN

Mr. Bryan: If your honor please, I insist that Mr. Darrow can be put on the stand, and Mr. Malone and Mr. Hays.

The Court: Call anybody you desire. Ask them any questions you wish.

Mr. Bryan: Then, we will call all three of them.

Mr. Darrow: Not at once?

Mr. Bryan: Where do you want me to sit?

The Court: Mr. Bryan, you are not objecting to going on the stand?

Mr. Bryan: Not at all.

The Court: Do you want Mr. Bryan sworn?

Mr. Darrow: No.

Mr. Bryan: I can make affirmation; I can say "So help me God, I will tell the truth."

Mr. Darrow: No, I take it you will tell the truth, Mr. Bryan. You have given considerable study to the Bible, haven't you, Mr. Bryan?

Mr. Bryan: Yes, sir, I have tried to.

Q—Well, we all know you have; we are not going to dispute that at all. But you have written and published articles almost weekly, and sometimes have made interpretations of various things?

A—I would not say interpretations, Mr. Darrow, but comments on the lesson.

Q—If you comment to any extent these comments have been interpretations.

A—I presume that my discussion might be to some extent interpretations, but they have not been primarily intended as interpretations.

Q—But you have studied that question, of course?

A—Of what?

Q—Interpretation of the Bible.

A—On this particular question?

Q—Yes, sir.

A—Yes, sir.

Q.—Then you have made a general study of it?

A—Yes, I have; I have studied the Bible for about fifty years, or something more than that, but, of course, I have studied it more as I have become older than when I was but a boy.

Q—Do you claim that everything in the Bible should be literally interpreted?

A—I believe everything in the Bible should be accepted as it is given there; some of the Bible is given illustratively. For instance: "Ye are the salt of the earth." I would not insist that man was actually salt, or that he had flesh of salt, but it is used in the sense of salt as saving God's people.

Q—But when you read that Jonah swallowed the whale—or that the whale swallowed Jonah—excuse me, please—how do you literally interpret that?

A—When I read that a big fish swallowed Jonah—it does not say whale.

Q—Doesn't it? Are you sure?

A—That is my recollection of it. A big fish, and I believe it, and I believe in a God who can make a whale and can make a man and make both do what He pleases.

Q—Mr. Bryan, doesn't the New Testament say whale?

A—I am not sure. My impression is that it says fish; but it does not make so much difference; I merely called your attention to

12 FAMOUS EXAMINATION OF BRYAN

where it says fish—it does not say whale.

Q—But in the New Testament it says whale, doesn't it?

A—That may be true; I cannot remember in my own mind what I read about it.

Q—Now, you say, the big fish swallowed Jonah, and he there remained how long—three days—and then he spewed him upon the land. You believe that the big fish was made to swallow Jonah?

A—I am not prepared to say that; the Bible merely says it was done.

Q—You don't know whether it was the ordinary run of fish, or made for that purpose?

A—You may guess; you evolutionists guess.

Q—But when we do guess, we have a sense to guess right.

A—But do not do it often.

Q—You are not prepared to say whether that fish was made especially to swallow a man or not?

A—The Bible doesn't say, so I am not prepared to say.

Q—You don't know whether that was fixed up specially for the purpose?

A—No, the Bible doesn't say.

Q—But do you believe He made them—that He made such a fish and that it was big enough to swallow Jonah?

A—Yes, sir. Let me add: One miracle is just as easy to believe as another.

Q—It is for you.

A—It is for me.

Q—Just as hard?

A—It is hard to believe for you, but easy

for me. A miracle is a thing performed beyond what man can perform. When you get beyond what man can do, you get within the realm of miracles; and it is just as easy to believe the miracle of Jonah as any other miracle in the Bible.

Q—Perfectly easy to believe that Jonah swallowed the whale?

A—If the Bible said so; the Bible doesn't make as extreme statements as evolutionists do.

Q—That may be a question, Mr. Bryan, about some of those you have known?

A—The only thing is, you have a definition of fact that includes imagination.

Q—And you have a definition that excludes everything but imagination?

Gen. Stewart: I object to that as argumentative.

The Witness: You—

Mr. Darrow: The witness must not argue with me, either.

Q—Do you consider the story of Jonah and the whale a miracle?

A—I think it is.

Q—Do you believe Joshua made the sun stand still?

A—I believe what the Bible says. I suppose you mean that the earth stood still?

Q—I don't know. I am talking about the Bible now.

A—I accept the Bible absolutely.

Q—The Bible says Joshua commanded the sun to stand still for the purpose of lengthening the day, doesn't it, and you believe it?

A—I do.

14 FAMOUS EXAMINATION OF BRYAN

Q—Do you believe at that time the sun went around the earth?

A—No, I believe that the earth goes around the sun.

Q—Do you believe that the men who wrote it thought that the day could be lengthened or that the sun could be stopped?

A—I don't know what they thought.

Q—You don't know?

A—I think they wrote the fact without expressing their own thoughts.

Q—Have you an opinion as to whether or not the men who wrote that thought—

Gen. Stewart: I want to object, your honor; it has gone beyond the pale of any issue that could possibly be injected into this lawsuit, except by imagination. I do not think the defendant has a right to conduct the examination any further and I ask your honor to exclude it.

The Court: I will hear Mr. Bryan.

The Witness: It seems to me it would be too exacting to confine the defense to the facts; if they are not allowed to get away from the facts, what have they to deal with?

The Court: Mr. Bryan is willing to be examined. Go ahead.

Mr. Darrow: Have you an opinion as to whether—whoever wrote the book, I believe Joshua, the Book of Joshua, thought the sun went around the earth or not?

A—I believe that he was inspired.

Q—Can you answer my question?

A—When you let me finish the statement.

Q—It is a simple question, but finish it.

A—You cannot measure the length of my answer by the length of your question. (*Laughter in the courtyard.*)

Q—No, except that the answer be longer. (*Laughter in the courtyard.*)

A—I believe that the Bible is inspired, with an inspired author. Whether one who wrote as he was directed to write understood the things he was writing about, I don't know.

Q—Whoever inspired it? Do you think whoever inspired it believed that the sun went around the earth?

A—I believe it was inspired by the Almighty, and He may have used language that could be understood at that time.

Q—Was—

A—Instead of using language that could not be understood until Darrow was born. (*Laughter and applause in the courtyard.*)

Q—So, it might have been subject to construction, might it not?

A—It might have been phrased in language that could be understood then.

Q—That means it is subject to construction?

A—That is your construction. I am answering your question.

Q—Is that correct?

A—That is my answer to it.

Q—Can you answer?

A—I might say, Isaiah spoke of God sitting upon the circle of the earth.

Q—I am not talking about Isaiah.

The Court: Let him illustrate, if he wants to.

16 FAMOUS EXAMINATION OF BRYAN

Q—Is it your opinion that passage was subject to construction?

A—Well, I think anybody can put his own construction upon it, but I do not mean that necessarily that is a correct construction. I have answered the question.

Q—Don't you believe that in order to lengthen the day it would have been construed that the earth stood still?

A—I would not attempt to say what would have been necessary, but I know this, that I can take a glass of water that would fall to the ground without the strength of my hand and to the extent of the glass of water I can overcome the law of gravitation and lift it up. Whereas without my hand it would fall to the ground. If my puny hand can overcome the law of gravitation, the most universally understood, to that extent, I would not set power to the hand of Almighty God that made the universe.

Q—I read that years ago. Can you answer my question directly? If the day was lengthened by stopping either the earth or the sun, it must have been the earth?

A—Well, I should say so.

Q—Yes? But it was language that was understood at that time, and we now know that the sun stood still as it was with the earth.

A—Well, no—

Q—We know also the sun does not stand still?

A—Well, it is relatively so, as Mr. Einstein would say.

Q—I ask you if it does stand still?

A—You know as well as I know.

Q—Better. You have no doubt about it?

A—No. And the earth moves around.

Q—Yes?

A—But I think there is nothing improper if you will protect the Lord against your criticism.

Q—I suppose He needs it?

A—He was using language at that time the people understood.

Q—And that you call “interpretation?”

A—No, sir; I would not call it interpretation.

Q—I say, you would call it interpretation at this time, to say it meant something then?

A—You may use your own language to describe what I have to say, and I will use mine in answering.

Q—Now, Mr. Bryan, have you ever pondered what would have happened to the earth if it had stood still?

A—No.

Q—You have not?

A—No; the God I believe in could have taken care of that, Mr. Darrow.

Q—I see. Have you ever pondered what would naturally happen to the earth if it stood still suddenly?

A—No.

Q—Don't you know it would have been converted into a molten mass of matter?

A—You testify to that when you get on the stand. I will give you a chance.

Q—Don't you believe it?

A—I would want to hear expert testimony on that.

Q—You have never investigated that subject?

A—I don't think I have ever had the question asked.

Q—Or ever thought of it?

A—I have been too busy on things that I thought were of more importance than that.

Q—You believe the story of the flood to be a literal interpretation?

A—Yes, sir.

Q—When was that flood?

A—I would not attempt to fix the date. The date is fixed, as suggested this morning.

Q—About 4004 B. C.?

A—That has been the estimate of a man that is accepted today. I would not say it is accurate.

Q—That estimate is printed in the Bible?

A—Everybody knows, at least, I think most of the people know, that was the estimate given.

Q—But what do you think that the Bible, itself, says? Don't you know how it was arrived at?

A—I never made a calculation.

Q—A calculation from what?

A—I could not say.

Q—From the generations of man?

A—I would not want to say that.

Q—What do you think?

A—I do not think about things I don't think about.

Q—Do you think about things you do think about?

A—Well, sometimes. (*Laughter in the court-yard.*)

The Policeman: Let us have order.

Mr. Darrow: Mr. Bryan, you have read these dates over and over again?

A—Not very accurately, I turn back sometimes to see what the time was.

Q—You want to say now you have no idea how these dates were computed?

A—No, I don't say, but I have told you what my idea was. I said I don't know how accurate it was.

Q—You say from the generation of man—

Gen. Stewart: I am objecting to his cross-examining his own witness.

Mr. Darrow: He is a hostile witness.

The Court: I am going to let Mr. Bryan control—

The Witness: I want him to have all the latitude he wants. For I am going to have some latitude when he gets through.

Mr. Darrow: You can have latitude and longitude. (*Laughter.*)

The Court: Order.

Gen. Stewart: The witness is entitled to be examined as to the legal evidence of it. We were supposed to go into the origin of the case, and we have nearly lost the day, your honor.

Mr. McKenzie: I object to it.

Gen. Stewart: Your honor, he is perfectly able to take care of this, but we are attaining no evidence. This is not competent evidence.

The Witness: These gentlemen have not had much chance—they did not come here to try this case. They came here to try revealed reli-

gion. I am here to defend it, and they can ask me any question they please.

The Court: All right. (*Applause from the court yard.*)

Mr. Darrow: Great applause from the bleachers.

The Witness: From those whom you call "yokels."

Mr. Darrow: I have never called them yokels.

The Witness: That is the ignorance of Tennessee, the bigotry.

Mr. Darrow: You mean who are applauding you? (*Applause.*)

The Witness: Those are the people whom you insult.

Mr. Darrow: You insult every man of science and learning in the world because he does not believe in your fool religion.

The Court: I will not stand for that.

Mr. Darrow: For what he is doing?

The Court: I am talking to both of you.

Gen. Stewart: This has gone beyond the pale of a lawsuit, your honor. I have a public duty to perform, under my oath and I ask the court to stop it. Mr. Darrow is making an effort to insult the gentleman on the witness stand, and I ask that it be stopped, for it has gone beyond the pale of a lawsuit.

The Court: To stop it now would not be just to Mr. Bryan. He wants to ask the other gentleman questions along the same line.

Gen. Stewart: It will all be incompetent.

The Witness: The jury is not here.

The Court: I do not want to be strictly technical.

Mr. Darrow: Then your honor rules, and I accept.

Gen. Stewart: The jury is not here.

Mr. Darrow: How long ago was the flood, Mr. Bryan?

A—Let me see Usher's calculation about it?

Mr. Darrow: Surely. (*Hands a Bible to the witness.*)

A—I think this does not give it.

Q—It gives an account of Noah. Where is the one in evidence? I am quite certain it is there.

A—Oh, I would put the estimate where it is, because I have no reason to vary it. But I would have to look at it to give you the exact date.

Q—I would too. Do you remember what book the account is in?

A—Genesis.

Mr. Hays: Is that the one in evidence?

Mr. Neal: That will have it; that is the King James' version.

Mr. Darrow: The one in evidence has it.

The Witness: It is given here, as 2,348 years B. C.

Q—Well, 2,348 years B. C. You believe that all the living things that were not contained in the ark were destroyed.

A—I think the fish may have lived.

Q—Outside of the fish?

A—I cannot say.

Q—You cannot say?

A—No, except that just as it is, I have no proof to the contrary.

Q—I am asking you whether you believe?

A—I do.

Q—That all living things outside of the fish were destroyed?

A—What I say about the fish is merely a matter of humor.

Q—I understand.

A—Due to the fact a man wrote up here the other day to ask whether all the fish were destroyed, and the gentleman who received the letter told him the fish may have lived.

Q—I am referring to the fish, too.

A—I accept that, as the Bible gives it and I have never found any reason for denying, disputing, or rejecting it.

Q—Let us make it definite, 2,348 years?

A—I didn't say that. That is the time given there (*indicating a Bible*) but I don't pretend to say that is exact.

Q—You never figured it out, these generations, yourself?

A—No, sir; not myself.

Q—But the Bible you have offered in evidence, says 2,340, something, so that 4,200 years ago there was not a living thing on the earth, excepting the people on the ark and the animals in the ark and the fishes?

A—There have been living things before that.

Q—I mean at that time?

A—After that.

Q—Don't you know there are any number of civilizations that are traced back to more than 5,000 years?

A—I know we have people who trace things back according to the number of ciphers they have. But I am not satisfied they are accurate.

Q—You are not satisfied there is any civilization that can be traced back 5,000 years?

A—I would not want to say there is because I have no evidence of it that is satisfactory.

Q—Would you say there is not?

A—Well, so far as I know, but when the scientists differ, from 24,000,000 to 306,000,000 in their opinion, as to how long ago life came here, I want them nearer, to come nearer together before they demand of me to give up my belief in the Bible.

Q—Do you say that you do not believe that there were any civilizations on this earth that reach back beyond 5,000 years?

A—I am not satisfied by any evidence that I have seen.

Q—I didn't ask you what you are satisfied with. I asked you if you believe it?

The Witness: Will you let me answer it?

The Court: Go right on.

The Witness: I am satisfied by no evidence that I have found, that would justify me in accepting the opinions of these men against what I believe to be the inspired Word of God.

Q—And you believe every nation, every organization of men, every animal, in the world outside of the fishes—

A—The fish, I want you to understand, is merely a matter of humor.

Q—I believe the Bible says so. Take the fishes in?

A—Let us get together and look over this.

Q—Probably we would better; we will after

we get through. You believe that all the various human races on the earth have come into being in the last 4,000 years or 4,200 years, whatever it is?

A—No, it would be more than that.

Q—1,927?

A—Some time after creation, before the flood.

Q—1,927 added to it?

A—The flood is 2,300 and something, and creation, according to the estimate there, is further back than that.

Q—Then you don't understand me. If we don't get together on it, look at the book. This is the year of grace 1925, isn't it? Let us put down 1,925. Have you a pencil? (*One of the defense attorneys hands Mr. Darrow a pencil.*)

The Witness: Add to that 4,004?

Mr. Darrow: Yes.

A—That is the date (referring to the Bible) given here on the first page, according to Bishop Usher, which I say I only accept because I have no reason to doubt it. On that page he gives it.

Q—1,925 plus 4,004 is 5,929 years, if a fallible person is right in his addition. Now, then, what do you subtract from that?

A—That is the beginning.

Q—I was talking about the flood.

A—2,348 on that, we said.

Q—Less than that?

A—No; subtract that from 4,000; it would be about 1,700 years.

Q—That is the same thing?

A—No; subtracted it is 2,300 and something

before the beginning of the Christian era, about 1,700 years after the creation.

The Policeman: Let us have order.

Mr. Darrow: If I add 2,300 years, that is the beginning of the Christian era?

A—Yes, sir.

Q—If I add 1,925 to that I will get it, won't I?

A—Yes, sir.

Q—That makes 4,262 years. If it is not correct, we can correct it.

A—According to the Bible there was a civilization before that, destroyed by the flood.

Q—Let me make this definite. You believe that every civilization on the earth and every living thing, except possibly fishes, that came out of the ark were wiped out by the flood?

A—At that time.

Q—At that time. And then, whatever human beings, including all the tribes, that inhabited the world, and have inhabited the world, and who run their pedigree straight back, and all the animals, have come onto the earth since the flood?

A—Yes.

Q—Within 4,200 years. Do you know a scientific man on the face of the earth that believes any such thing?

A—I cannot say, but I know some scientific men who dispute entirely the antiquity of man as testified to by other scientific men.

Q—Oh, that does not answer the question. Do you know of a single scientific man on the face of the earth that believes any such thing as you stated, about the antiquity of man?

A—I don't think I have ever asked one the direct question.

Q—Quite important, isn't it?

A—Well, I don't know as it is.

Q—It might not be?

A—If I had nothing else to do except speculate on what our remote ancestors were and what our remote descendants have been—but I have been more interested in Christians living right now, to make it much more important than speculation on either the past or the future.

Q—You have never had any interest in the age of the various races and people and civilization and animals that exist upon the earth today? Is that right?

A—I have never felt a great deal of interest in the effort that has been made to dispute the Bible by the speculations of men, or the investigations of men.

Q—Are you the only human being on earth who knows what the Bible means?

Gen. Stewart: I object.

The Court: Sustained.

Mr. Darrow: You do know that there are thousands of people who profess to be Christians who believe the earth is much more ancient and that the human race is much more ancient?

A—I think there may be.

Q—And you never have investigated to find out how long man has been on the earth?

A—I have never found it necessary.

Q—For any reason, whatever it is?

A—To examine every speculation; but if I

had done it I never would have done anything else.

Q—I ask for a direct answer.

A—I do not expect to find out all those things, and I do not expect to find out about races.

Q—I didn't ask you that. Now, I ask you if you know if it was interesting enough, or important enough for you to try to find out about how old these ancient civilizations were?

A—No; I have not made a study of it.

Q—Don't you know that the ancient civilizations of China are 6,000 or 7,000 years old, at the very least?

A—No; they would not run back beyond the creation, according to the Bible, 6,000 years.

Q—you don't know how old they are, is that right?

A—I don't know how old they are, but probably you do. (*Laughter in the courtyard.*) I think you would give the preference to anybody who opposed the Bible, and I give the preference to the Bible.

Q—I see. Well, you are welcome to your opinion. Have you any idea how old the Egyptian civilization is?

A—No.

Q—Do you know of any record in the world, outside of the story of the Bible, which conforms to any statement that it is 4,200 years ago or thereabouts that all life was wiped off the face of the earth?

A—I think they have found records.

Q—Do you know of any?

A—Records reciting the flood, but I am not an authority on the subject.

Q—Now, Mr. Bryan, will you say if you know of any record, or have ever heard of any records, that describe that a flood existed 4,200 years ago, or about that time, which wiped all life off the earth?

A—The recollection of what I have read on that subject is not distinct enough to say whether the records attempted to fix a time, but I have seen in the discoveries of archeologists where they have found records that described the flood.

Q—Mr. Bryan, don't you know that there are many old religions that describe the flood?

A—No, I don't know.

Q—You know there are others besides the Jewish?

A—I don't know whether there are records of any other religion which refer to this flood.

Q—Don't you ever examine religion so far as to know that?

A—Outside of the Bible?

Q—Yes.

A—No; I have not examined to know that, generally.

Q—You have never examined any other religions?

A—Yes, sir.

Q—Have you ever read anything about the origins of religions?

A—Not a great deal.

Q—You have never examined any other religion?

A—Yes, sir.

Q—And you don't know whether any other religion ever gave a similar account of the destruction of the earth by the flood?

A—The Christian religion has satisfied me, and I have never felt it necessary to look up some competing religions.

Q—Do you consider that every religion on earth competes with the Christian religion?

A—I think everybody who does not believe in the Christian religion believes so—

Q—I am asking what you think.

A—I do not regard them as competitive because I do not think they have the same source as we have.

Q—You are wrong in saying “competitive.”

A—I would not say competitive, but the religious unbelievers.

Q—Unbelievers of what?

A—In the Christian religion.

Q—What about the religion of Buddha?

A—I can tell you something about that, if you want to know.

Q—What about the religion of Confucius or Buddha?

A—Well, I can tell you something about that, if you would like to know.

Q—Did you ever investigate them?

A—Somewhat.

Q—Do you regard them as competitive?

A—No, I think they are very inferior. Would you like for me to tell you what I know about it.

Q—No.

A—Well, I shall insist on giving it to you.

Q—You won't talk about free silver, will you?

A—Not at all.

Gen. Stewart: I object to him—counsel—going any further with this examination and cross-examining his own witness. He is your own witness.

Mr. Darrow: Well, now, general, you understand we are making up a record, and I assume that every lawyer knows perfectly well that we have a right to cross-examine a hostile witness. Is there any doubt about that?

Gen. Stewart: Under the law in Tennessee if you put a witness on and he proves to be hostile to you, the law provides the method by which you may cross-examine him. You will have to make an affidavit that you are surprised at his statement, and you may do that.

Mr. Bryan: Is there any way by which a witness can make an affidavit that the attorney is also hostile?

Mr. Darrow: I am not hostile you you. I am hostile to your views, and I suppose that runs with me, too.

Mr. Bryan: But I think when the gentleman asked me about Confucius I ought to be allowed to answer his question.

Mr. Darrow: Oh, tell it, Mr. Bryan, I won't object to it.

Mr. Bryan: I had occasion to study Confucianism when I went to China. I got all I could find about what Confucius said, and then I bought a book that told us what Menches said about what Confucius said, and I found that there were several direct and strong contrasts between the teachings of Jesus and the teachings of Confucius. In the first place, one of his followers asked if there was any word that

would express all that was necessary to know in the relations of life, and he said, "Isn't *reciprocity* such a word?" I know of no better illustration of the difference between Christianity and Confucianism than the contrast that is brought out there. Reciprocity is a calculating selfishness. If a person does something for you, you do something for him and keep it even. That is the basis of the philosophy of Confucius. Christ's doctrine was not reciprocity. We were told to help people not in proportion as they had helped us—not in proportion as they might have helped us, but in proportion to their needs, and there is all the difference in the world between a religion that teaches you just to keep even with other people and the religion that teaches you to spend yourself for other people and to help them as they need help.

Q—There is no doubt about that; I haven't asked you that.

A—That is one of the differences between the two.

Q—Do you know how old the Confucian religion is?

A—I can't give you the exact date of it.

Q—Did you ever investigate to find out?

A—Not to be able to speak definitely as to date, but I can tell you something I read, and will tell you.

Q—Wouldn't you just as soon answer my questions? And get along?

A—Yes, sir.

Q—Of course, if I take any advantage of misquoting you, I don't object to being stopped.

Do you know how old the religion of Zoroaster is?

A—No, sir.

Q—Do you know they are both more ancient than the Christian religion?

A—I am not willing to take the opinion of people who are trying to find excuses for rejecting the Christian religion when they attempt to give dates and hours and minutes, and they will have to get together and be more exact than they have yet been able, to compel me to accept just what they say as if it were absolutely true.

A—Are you familiar with James Clark's book on the ten great religions?

A—No.

Q—He was a Unitarian minister, wasn't he? You don't think he was trying to find fault, do you?

A—I am not speaking of the motives of men.

Q—You don't know how old they are, all these other religions?

A—I wouldn't attempt to speak correctly, but I think it is much more important to know the difference between them than to know the age.

Q—Not for the purpose of this inquiry, Mr. Bryan. Do you know about how many people there were on this earth at the beginning of the Christian era?

A—No, I don't think I ever saw a census on that subject.

Q—Do you know about how many people there were on this earth 3,000 years ago?

A—No.

Q—Did you ever try to find out?

A—When you display my ignorance, could you not give me the facts so I would not be ignorant any longer? Can you tell me how many people there were when Christ was born?

Q—You know, some of us might get the facts and still be ignorant.

A—Will you please give me that? You ought not to ask me a question when you don't know the answer to it.

Q—I can make an estimate.

A—What is your estimate?

Q—Wait until you get to me. Do you know anything about how many people there were in Egypt 3,500 years ago, or how many people there were in China 5,000 years ago?

A—No.

Q—Have you ever tried to find out?

A—No, sir. You are the first man I ever heard of who has been interested in it. (*Laughter.*)

Q—Mr. Bryan, am I the first man you ever heard of who has been interested in the age of human societies and primitive man?

A—You are the first man I ever heard speak of the number of people at those different periods.

Q—Where have you lived all your life?

A—Not near you. (*Laughter and applause.*)

Q—Nor near anybody of learning?

A—Oh, don't assume you know it all.

Q—Do you know there are thousands of books in our libraries on all those subjects I have been asking you about?

A—I couldn't say, but I will take your word for it.

Q—Did you ever read a book on primitive man? Like Tyler's "Primitive Culture," or Boaz, or any of the great authorities?

A—I don't think I ever read the ones you have mentioned.

Q—Have you read any?

A—Well I have read a little from time to time. But I didn't pursue it, because I didn't know I was to be called as a witness.

Q—You have never in all your life made any attempt to find out about the other peoples of the earth—how old their civilizations are—how long they had existed on the earth, have you?

A—No, sir, I have been so well satisfied with the Christian religion that I have spent no time trying to find arguments against it.

Q—Were you afraid you might find some?

A—No, sir; I am not afraid now that you will show me any.

Q—You remember that man who said—I am not quoting literally—that one could not be content though he rose from the dead—you suppose you could be content?

A—Well, will you give the rest of it, Mr. Darrow?

Q—No.

A—Why not?

Q—I am not interested.

A—Why scrap the Bible—"they have Moses and the prophets"?

Q—Who has?

A—That is the rest of the quotation you didn't finish.

Q—And so you think if they have Moses and the prophets they don't need to find out anything else?

A—That was the answer that was made there.

Q—And you follow the same rule?

A—I have all the information I want to live by and to die by.

Q—And that's all you are interested in?

A—I am not looking for any more on religion.

Q—You don't care how old the earth is, how old man is and how long the animals have been here?

A—I am not so much interested in that.

Q—You have never made any investigation to find out?

A—No, sir, I have never.

Q—All right.

A—Now, will you let me finish the question.

Q—What question was that? If there is anything more you want to say about Confucius I don't object.

A—Oh, yes, I have got two more things.

Mr. Darrow: If your honor please I don't object, but his speeches are not germane to my question.

Mr. Hicks (Sue K.): Your honor, he put him on.

The Court: You went into it and I will let him explain.

Mr. Darrow: I asked him certain specific questions about Confucius.

Mr. Hicks (Sue K.): The questions he is asking are not germane, either.

Mr. Darrow: I think they are.

The Witness: I mentioned the word *reci-*

procity to show the difference between Christ's teachings in that respect and the teachings of Confucius. I call your attention to another difference. One of the followers of Confucius asked him "what do you think of the doctrine that you should reward evil with good?" and the answer of Confucius was "reward evil with justice and reward good with good. Love your enemies. Overcome evil with good," and there is a difference between the two teachings—a difference incalculable in its effect and in—The third difference—people who scoff at religion and try to make it appear that Jesus brought nothing into the world, talk about the Golden Rule of Confucius. Confucius said "do not unto others what you would not have others do unto you." It was purely negative. Jesus taught "do unto others as you would have others do unto you." There is all the difference in the world between a negative harmlessness and a positive helpfulness and the Christian religion is a religion of helpfulness, of service, embodied in the language of Jesus when he said "let him who would be chiefest among you be the servant of all." Those are the three differences between the teachings of Jesus and the teachings of Confucius, and they are very strong differences on very important questions. Now, Mr. Darrow, you asked me if I knew anything about Buddha.

Q—You want to make a speech on Buddha, too?

A—No, sir; I want to answer your question on Buddha.

Q—I asked you if you knew anything about him.

A—I do.

Q—Well, that's answered, then.

A—Buddha—

Q—Well, wait a minute, you answered the questions—

The Court: I will let him tell what he knows.

Mr. Darrow: All he knows?

The Court: Well, I don't know about that.

The Witness: I won't insist in telling all I know. I will tell more than Mr. Darrow wants told.

Mr. Darrow: Well, all right, tell it, I don't care.

The Witness: Buddhism is an agnostic religion.

Q—To what?—what do you mean by agnostic?

A—I don't know.

Q—You don't know what you mean?

A—That is, what "agnosticism" is—I don't know. When I was in Rangoon, Burma, one of the Buddhists told me that they were going to send a delegation to an agnostic congress that was to be held soon at Rome and I read in an official document—

Q—Do you remember his name?

A—No, sir, I don't.

Q—What did he look like; how tall was he?

A—I think he was about as tall as you, but not so crooked.

Q—Do you know about how old a man he

was—do you know whether he was old enough to know what he was talking about?

A—He seemed to be old enough to know what he was talking about. (*Laughter.*)

Mr. Darrow: If your honor please, instead of answering plain specific questions we are permitting the witness to regale the crowd with what some black man said to him when he was traveling in Rang—who, India?

The Witness: He was dark-colored, but not black.

The Court: I will let him go ahead and answer.

The Witness: I wanted to say that I then read a paper that he gave me, an official paper of the Buddhist church, and it advocated the sending of delegates to that agnostic congress at Rome, arguing that it was an agnostic religion, and I will give you other evidence of it. I went to call on a Buddhist teacher.

Mr. Darrow: I object to Mr. Bryan making a speech every time I ask him a question.

The Court: Let him finish this answer and then you can go ahead.

The Witness: I went to call on a Buddhist priest and found him at his noon meal, and there was an Englishman there who was also a Buddhist. He went over as ship's carpenter and became a Buddhist and had been for about six years and while I waited for the Buddhist priest I talked to the Englishman and I asked him what was the most important thing in Buddhism and he said the most important thing was you didn't have to believe to be a Buddhist.

Q—You know the name of the Englishman?

A—No, sir; I don't know his name.

Q—What did he look like?

A—He was what I would call an average looking man.

Q—How could you tell he was an Englishman?

A—He told me so.

Q—Do you know whether he was truthful or not?

A—No, sir, but I took his word for it.

The Court: Well, get along, Mr. Darrow, with your examination.

Mr. Darrow: Mr. Bryan ought to get along.

Q—You have heard of the Tower of Babel haven't you?

A—Yes, sir.

Q—That tower was built under the ambition that they could build a tower up to heaven, wasn't it? And God saw what they were at and to prevent their getting into heaven he confused their tongues?

A—Something like that—I wouldn't say to prevent their getting into heaven. I don't think it is necessary to believe that God was afraid they would get to heaven—

Q—I mean that way?

A—I think it was a rebuke to them.

Q—A rebuke to them trying to go that way?

A—To build that tower for that purpose.

Q—Take that short cut?

A—That is your language, not mine.

Q—Now when was that?

A—Give us the Bible.

Q—Yes, we will have strict authority on it—scientific authority?

A—That was about 100 years before the flood, Mr. Darrow, according to this chronology. It is 2247—the date on one page is 2218 and on the other 2247 and it is described in here—

Q—That is the year 2247?

A—2218 B. C. is at the top of one page and 2247 at the other and there is nothing in here to indicate the change.

Q—Well, make it 2230 then?

A—All right—about.

Q—Then you add 1500 to that—

A—No, 1925.

Q—Add 1925 to that, that would be 4,155 years ago. Up to 4,155 years ago every human being on earth spoke the same language?

A—Yes, sir, I think that is the inference that could be drawn from that.

Q—All the different languages of the earth date from the Tower of Babel, is that right? Do you know how many languages are spoken on the face of the earth?

A—No, I know the Bible has been translated into 500 and no other book has been translated into anything like that many.

Q—That is interesting, if true. Do you know all the languages there are?

A—No, sir, I can't tell you. There may be many dialects besides that and some languages, but those are all the principal languages.

Q—There are a great many that are not principal languages?

A—Yes, sir.

Q—You haven't any idea how many there are?

A—No, sir.

Q—How many people have spoken all those various languages?

A—I don't know.

Q—And you say that all those languages of all the sons of men have come on the earth not over 4,150 years ago?

A—I have seen no evidence that would lead me to put it any further back than that.

Q—That is your belief anyway—that that was due to the confusion of tongues at the tower of Babel. Did you ever study philology at all?

A—No, I have never made a study of it—not in the sense in which you speak of it.

Q—You have used language all your life?

A—Well, hardly all my life—ever since I was about a year old.

Q—And good language, too; and you have never taken any pains to find anything about the origin of languages?

A—I have never studied it as a science.

Q—Have you ever by any chance read Max Mueller?

A—No.

Q—The great German philologist?

A—No.

Q—Or any book on that subject?

A—I don't remember to have read a book on that subject, especially, but I have read extracts, of course, and articles on philology.

Q—Mr. Bryan, could you tell me how old the earth is?

A—No, sir, I couldn't.

Q—Could you come anywhere near it?

A—I wouldn't attempt to. I could possibly

come as near as the scientists do, but I had rather be more accurate before I give a guess.

Q—You don't think much of scientists, do you?

A—Yes, sir, I do, sir.

Q—Is there any scientists in the world you think much of?

A—I do.

Q—Who?

A—Well, I think the bulk of the scientists—

Q—I don't want that kind of an answer, Mr. Bryan. Who are they?

A—I will give you George M. Price, for instance.

Q—Who is he?

A—Professor of geology in a college.

Q—Where?

A—He was out near Lincoln, Neb.

Q—How close to Lincoln, Neb.?

A—About three or four miles. He is now in a college out in California.

Q—Where is the college?

A—At Lodi.

Q—That is a small college?

A—I didn't know you had to judge a man by the size of the college—I thought you judged him by the size of the man.

Q—I thought the size of the college made some difference?

A—It might raise a presumption in the minds of some, but I think I would rather find out what he believed.

Q—You would rather find out whether his belief corresponds with your views or prejudices

or whatever they are before you said how good he was?

A—Well, you know the word "prejudice" is—

Q—Well, belief, then.

A—I don't think I am any more prejudiced for the Bible than you are against it.

Q—Well, I don't know.

A—Well, I don't know either. It is my guess.

Q—You mentioned Price because he is the only human being in the world so far as you know that signs his name as geologist that believes like you do?

A—No, there is a man named Wright, who taught at Oberlin.

Q—I will get to Mr. Wright in a moment. Who publishes his book?

A—I can't tell you. I can get you the book.

Q—Don't you know? Don't you know it is Revell & Co., Chicago?

A—I couldn't say.

Q—He publishes yours, doesn't he?

A—Yes, sir.

Gen. Stewart: Will you let me make an exception. I don't think it is pertinent about who publishes a book.

Mr. Darrow: He has quoted a man that every scientist in this country knows is a mountebank and a pretender and not a geologist at all.

The Court: You can ask him about the man, but don't ask him about who publishes the book.

Q—Do you know anything about the college he is in?

A—No, I can't tell you.

44 FAMOUS EXAMINATION OF BRYAN

Q—Do you know how old his book is?

A—No, sir; it is a recent book.

Q—Do you know anything about his training?

A—No, I can't say on that.

Q—Do you know of any geologist on the face of the earth who ever recognized him?

A—I couldn't say.

Q—Do you think he is all right? How old does he say the earth is?

A—I am not sure that I would insist on some particular geologist that you picked out recognizing him before I would consider him worthy if he agreed with your views.

Q—You would consider him worthy if he agreed with your views?

A—Well, I think his argument is very good.

Q—How old does Mr. Price say the earth is?

A—I haven't examined the book in order to answer questions on it.

Q—Then you don't know anything about how old he says it is?

A—He speaks of the layers that are supposed to measure age and points out that they are not uniform and not always the same and that attempts to measure age by those layers where they are not in the order in which they are usually found makes it difficult to fix the exact age.

Q—Does he say anything whatever about the age of the earth?

A—I wouldn't be able to testify.

Q—You didn't get anything about the age from him?

A—Well, I know he disputes what you say

and has very good evidence to dispute it—what some others say about the age.

Q—Where did you get your information about the age of the earth?

A—I am not attempting to give you information about the age of the earth.

Q—Then you say there was Mr. Wright, of Oberlin?

A—That was rather I think on the age of man than upon the age of the earth.

Q—There are two Mr. Wrights, of Oberlin?

A—I couldn't say.

Q—Both of them geologists. Do you know how long Mr. Wright says man has been on the earth?

A—Well, he gives the estimates of different people.

Q—Does he give any opinion of his own?

A—I think he does.

Q—What is it?

A—I am not sure.

Q—What is it?

A—It was based upon the last glacial age—that man has appeared since the last glacial age.

Q—Did he say there was no man on earth before the last glacial age?

A—I think he disputes the finding of any proof—where the proof is authentic—but I had rather read him than quote him. I don't like to run the risk of quoting from memory.

Q—You couldn't say then how long Mr. Wright places it?

A—I don't attempt to tell you.

Q—When was the last glacial age?

A—I wouldn't attempt to tell you that.

Q—Have you any idea?

A—I wouldn't want to fix it without looking at some of the figures.

Q—That was since the tower of Babel, wasn't it?

A—Well, I wouldn't want to fix it. I think it was before the time given in here, and that was only given as the possible appearance of man and not the actual.

Q—Have you any idea how far back the last glacial age was?

A—No, sir.

Q—Do you know whether it was more than 6,000 years ago?

A—I think it was more than 6,000 years.

Q—Have you any idea how old the earth is?

A—No.

Q—The book you have introduced in evidence tells you, doesn't it?

A—I don't think it does, Mr. Darrow.

Q—Let's see whether it does; is this the one?

A—That is the one, I think.

Q—It says B. C. 4004.

A—That is Bishop Usher's calculation.

Q—That is printed in the Bible you introduced?

A—Yes, sir.

Q—And numerous other Bibles?

A—Yes, sir.

Q—Printed in the Bible in general use in Tennessee?

A—I couldn't say.

Q—And Scofield's Bible?

A—I couldn't say about that.

Q—You have seen it somewhere else?

A—I think that is the chronology usually used.

Q—Does the Bible you have introduced for the jury's consideration say that?

A—Well, you will have to ask those who introduced that.

Q—You haven't practiced law for a long time, so I will ask you if that is the King James version that was introduced? That is your marking, and I assume it is?

A—I think that is the same one.

Mr. Darrow: There is no doubt about it, is there, gentlemen?

Mr. Stewart: That is the same one.

Q—Would you say that the earth was only 4,000 years old?

A—Oh, no; I think it is much older than that.

Q—How much?

A—I couldn't say.

Q—Do you say whether the Bible itself says it is older than that?

A—I don't think the Bible says itself whether it is older or not.

Q—Do you think the earth was made in six days?

A—Not six days of twenty-four hours.

Q—Doesn't it say so?

A—No, sir.

Gen. Stewart: I want to interpose another objection. What is the purpose of this examination?

Mr. Bryan: The purpose is to cast ridicule on everybody who believes in the Bible, and I am perfectly willing that the world shall know

48 FAMOUS EXAMINATION OF BRYAN

that these gentlemen have no other purpose than ridiculing every Christian who believes in the Bible.

Mr. Darrow: We have the purpose of preventing bigots and ignoramuses from controlling the education of the United States and you know it, and that is all.

Mr. Bryan: I am glad to bring out that statement. I want the world to know that this evidence is not for the view Mr. Darrow and his associates have filed affidavits here stating, the purpose of which, I understand, is to show that the Bible story is not true.

Mr. Malone: Mr. Bryan seems anxious to get some evidence in the record that would tend to show that those affidavits are not true.

Mr. Bryan: I am not trying to get anything into the record. I am simply trying to protect the word of God against the greatest atheist or agnostic in the United States. (*Prolonged applause.*) I want the papers to know I am not afraid to get on the stand in front of him and let him do his worst. I want the world to know. (*Prolonged applause.*)

Mr. Darrow: I wish I could get a picture of these clackers.

Gen. Stewart: I am not afraid of Mr. Bryan being perfectly able to take care of himself, but this examination cannot be a legal examination and it cannot be worth a thing in the world, and, your honor, I respectfully except to it, and call on your honor, in the name of all that is legal, to stop this examination and stop it here.

Mr. Hays: I rather sympathize with the gen-

eral, but Mr. Bryan is produced as a witness because he is a student of the Bible and he presumably understands what the Bible means. He is one of the foremost students in the United States, and we hope to show Mr. Bryan, who is a student of the Bible, what the Bible really means in connection with evolution. Mr. Bryan has already stated that the world is not merely 6,000 years old and that is very helpful to us, and where your evidence is coming from, this Bible, which goes to the jury, is that the world started in 4004 B. C.

Mr. Bryan: You think the Bible says that?

Mr. Hays: The one you have taken in evidence says that.

Mr. Bryan: I don't concede that it does.

Mr. Hays: You know that that chronology is made up by adding together all of the ages of the people in the Bible, counting their ages; and now then, let us show the next stage from a Bible student, that these things are not to be taken literally, but that each man is entitled to his own interpretation.

Gen. Stewart: The court makes the interpretation.

Mr. Hays: But the court is entitled to information on what is the interpretation of an expert Bible student.

Gen. Stewart: This is resulting in a harangue and nothing else.

Mr. Darrow: I didn't do any of the haranguing; Mr. Bryan has been doing that.

Gen. Stewart: You know absolutely you have done it.

Mr. Darrow: Oh, all right.

Mr. Malone: Mr. Bryan doesn't need any support.

Gen. Stewart: Certainly he doesn't need any support, but I am doing what I conceive my duty to be, and I don't need any advice, if you please, sir. (*Applause.*)

The Court: That would be irrelevant testimony if it was going to the jury. Of course, it is excluded from the jury on the point it is not competent testimony, on the same ground as the affidaviting.

Mr. Hicks: Your honor, let me say a word right there. It is in the discretion of the court how long you will allow them to question witnesses for the purpose of taking testimony to the supreme court. Now, we as taxpayers of this county, feel that this has gone beyond reason.

The Court: Well, now, that taxpayers' complaint doesn't appeal to me so much, when it is only fifteen or twenty minutes time.

Mr. Darrow: I would have been through in half an hour if Mr. Bryan had answered my questions.

Gen. Stewart: They want to put in affidavits as to what other witnesses would swear, why not let them put in affidavits as to what Mr. Bryan would swear?

Mr. Bryan: God forbid.

Mr. Malone: I will just make this suggestion.

Gen. Stewart: It is not worth anything to them, if your honor please, even for the record in the supreme court.

Mr. Hays: Is not it worth anything to us if Mr. Bryan will accept the story of creation in detail, and if Mr. Bryan, as a Bible student, states you cannot take the Bible necessarily as literally true?

Mr. Stewart: The Bible speaks for itself.

Mr. Hays: You mean to say the Bible itself tells whether these are parables? Does it?

Gen. Stewart: We have left all annals of procedure behind. This is a harangue between Col. Darrow and his witness. He makes so many statements that he is forced to defend himself.

Mr. Darrow: I do not do that.

Gen. Stewart: I except to that as not pertinent to this lawsuit.

The Court: Of course, it is not pertinent, or it would be before the jury.

Gen. Stewart: It is not worth anything before a jury.

The Court: Are you about through, Mr. Darrow?

Mr. Darrow: I want to ask a few more questions about the creation.

The Court: I know. We are going to adjourn when Mr. Bryan comes off the stand for the day. Be very brief, Mr. Darrow. Of course, I believe I will make myself clearer. Of course, it is incompetent testimony before the jury. The only reason I am allowing this to go in at all is that they may have it in the appellate courts, as showing what the affidavit would be.

Mr. Bryan: The reason I am answering is not for the benefit of the superior court. It is

to keep these gentlemen from saying I was afraid to meet them and let them question me, and I want the Christian world to know that any atheist, agnostic, or unbeliever, can question me any time as to my belief in God, and I will answer him.

Mr. Darrow: I want to take an exception to this conduct of this witness. He may be very popular down here in the hills. I do not need to have his explanation for his answer.

The Court: Yes.

Mr. Bryan: If I had not, I would not have answered the question.

Mr. Hays: May I be heard? I do not want your honor to think we are asking questions of Mr. Bryan with the expectation that the higher court will not say that those questions are proper testimony. The reason I state this is this: your law speaks for the Bible. Your law does not say the literal interpretation of the Bible. If Mr. Bryan, who is a student of the Bible, will state that everything in the Bible need not be interpreted literally, that each man must judge for himself; if he will state that, of course, then your honor would charge the jury. We are not bound by a literal interpretation of the Bible. If I have made my argument clear enough for the attorney-general to understand, I will retire.

Gen. Stewart: I will admit you have frequently been difficult of comprehension, and I think you are as much to blame as I am.

Mr. Hays: I know I am.

Gen. Stewart: I think this is not legal evidence for the record in the appellate courts.

King James' versions of the Bible, as your honor says—

The Court: I cannot say that.

Gen. Stewart: Your honor has held the court takes judicial knowledge of King James' version of the Bible.

The Court: No, sir; I did not do that.

Gen. Stewart: Your honor charged the grand jury and read from that.

The Court: I happened to have the Bible in my hand, it happened to be a King James' edition, but I will charge the jury, gentlemen, the Bible generally used in Tennessee, as the book ordinarily understood in Tennessee, as the Bible, I do not think it is proper for us to say to the jury what Bible.

Gen. Stewart: Of course, that is all we could ask of your honor. This investigation or interrogation, of Mr. Bryan as a witness, Mr. Bryan is called to testify, was of the counsel for the prosecution in this case, and has been asked something, perhaps less than a thousand questions, of course, not personal to this case, and it has resulted in an argument, an argument about every other question cannot be avoided. I submit your honor, it is not worth anything in the record at all, if it is not legal testimony. Mr. Bryan is willing to testify and is able to defend himself. I except it, if the court please, and ask your honor to stop it.

Mr. Hays: May I ask a question? If your contention is correct that this law does not necessarily mean that the Bible is to be taken literally, word for word, is not this competent evidence?

Gen. Stewart: Why could you not prove it by your scientists.

Mr. Darrow: We are calling one of the foremost Bible students. You vouch for him.

Mr. Malone: We are offering the best evidence.

Gen. McKenzie: Do you think this evidence is competent before a jury?

Mr. Darrow: I think so.

The Court: It is not competent evidence for the jury.

Gen. McKenzie: Nor is it competent in the appellate courts, and these gentlemen would no more file the testimony of Col. Bryan as a part of the record in this case than they would file a rattlesnake and handle it themselves.

Messrs. Darrow, Hays and Malone (in unison): We will file it. We will file it. File every word of it.

Mr. Bryan: Your honor, they have not asked a question legally, and the only reason they have asked any question is for the purpose, as the question about Jonah was asked, for a chance to give this agnostic an opportunity to criticize a believer in the word of God; and I answered the question in order to shut his mouth so that he cannot go out and tell his atheistic friends that I would not answer his question. That is the only reason, no more reason in the world.

Mr. Malone: Your honor, on this very subject, I would like to say that I would have asked Mr. Bryan—and I consider myself as good a Christian as he is—every question that

Mr. Darrow has asked him for the purpose of bringing out whether or not there is to be taken in this court only a literal interpretation of the Bible, or whether, obviously, as these questions indicate, if a general and liberal construction cannot be put upon the parts of the Bible which have been covered by Mr. Darrow's questions. I hope for the last time no further attempt will be made by counsel on the other side of the case, or Mr. Bryan, to say the defense is concerned at all with Mr. Darrow's particular religious views or lack of religious views. We are here as lawyers with the same right to our views. I have the same right to mine as a Christian as Mr. Bryan has to his, and we do not intend to have this case charged by Mr. Darrow's agnosticism or Mr. Bryan's brand of Christianity. (*A great applause.*)

The Court: I will pass on each question as asked, if it is objected to.

Mr. Darrow: Mr. Bryan, do you believe that the first woman was Eve?

A—Yes.

Q—Do you believe she was literally made out of Adam's rib?

A—I do.

Q—Did you ever discover where Cain got his wife?

A—No, sir; I leave the agnostics to hunt for her.

Q—You have never found out?

A—I have never tried to find out.

Q—You have never tried to find out?

A—No.

Q—The Bible says he got one, doesn't it? Were there other people on the earth at that time?

A—I cannot say.

Q—You cannot say. Did that ever enter your consideration?

A—Never bothered me.

Q—There were no others recorded, but Cain got a wife.

A—That is what the Bible says.

Q—Where she came from you do not know. All right. Does the statement, "The morning and the evening were the first day," and "The morning and the evening were the second day," mean anything to you?

A—I do not think it necessarily means a twenty-four hour day.

Q—You do not?

A—No.

Q—What do you consider it to be?

A—I have not attempted to explain it. If you will take the second chapter—let me have the book. (*Examines Bible.*) The fourth verse of the second chapter says: "These are the generations of the heavens and of the earth, when they were created in the day that the Lord God made the earth and the heavens," The word "day" there in the very next chapter is used to describe a period. I do not see that there is any necessity for construing the words, "the evening and the morning," as meaning necessarily a twenty-four hour day, "in the day when the Lord made the heaven and the earth."

Q—Then, when the Bible said, for instance, "and God called the firmament heaven. And the evening and the morning were the second day," that does not necessarily mean twenty-four hours?

A—I do not think it necessarily does.

Q—Do you think it does or does not?

A—I know a great many think so.

Q—What do you think?

A—I do not think it does.

Q—You think those were not literal days?

A—I do not think they were twenty-four-hour days.

Q—What do you think about it?

A—That is my opinion—I do not know that my opinion is better on that subject than those who think it does.

Q—You do not think that?

A—No. But I think it would be just as easy for the kind of God we believe in to make the earth in six days as in six years or in 6,000,000 years or in 600,000,000 years. I do not think it important whether we believe one or the other.

Q—Do you think those were literal days?

A—My impression is they were periods, but I would not attempt to argue as against anybody who wanted to believe in literal days.

Q—Have you any idea of the length of the periods?

A—No; I don't.

Q—Do you think the sun was made on the fourth day?

A—Yes.

Q—And they had evening and morning without the sun?

A—I am simply saying it is a period.

Q—They had evening and morning for four periods without the sun, do you think?

A—I believe in creation as there told, and if I am not able to explain it I will accept it. Then you can explain it to suit yourself.

Q—Mr. Bryan, what I want to know is, do you believe the sun was made on the fourth day?

A—I believe just as it says there.

Q—Do you believe the sun was made on the fourth day?

A—Read it.

Q—I am very sorry; you have read it so many times you would know, but I will read it again:

And God, said, let there be lights in the firmament of the heaven, to divide the day from the night; and let them be for signs, and for seasons, and for days, and years. And let them be for lights in the firmament of the heaven, to give light upon the earth; and it was so. And God made two great lights; the greater light to rule the day, and the lesser light to rule the night; He made the stars also. And God set them in the firmament of the heaven, to give light upon the earth, and to rule over the day and over the night, and to divide the light from the darkness; and God saw that it was good. And the evening and the morning were the fourth day.

Do you believe, whether it was a literal day or a period, the sun and the moon were not made until the fourth day?

A—I believe they were made in the order in which they were given there, and I think in the dispute with Gladstone and Huxley on that point—

Q—Cannot you answer my question?

A—I prefer to agree with Gladstone.

Q—I do not care about Gladstone.

A—Then prefer to agree with whoever you please.

Q—Cannot you answer my question?

A—I have answered it. I believe that it was made on the fourth day, in the fourth day.

Q—And they had the evening and the morning before that time for three days or three periods. All right, that settles it. Now, if you call those periods, they may have been a very long time.

A—They might have been.

Q—The creation might have been going on for a very long time?

A—It might have continued for millions of years.

Q—Yes. All right. Do you believe the story of the temptation of Eve by the serpent?

A—I do.

Q—Do you believe that after Eve ate the apple, or gave it to Adam, whichever way it was, that God cursed Eve, and at that time decreed that all womankind thenceforth and forever should suffer the pains of childbirth in the reproduction of the earth?

A—I believe what it says, and I believe the fact as fully——

Q—That is what it says, doesn't it?

A—Yes.

Q—And for that reason. every woman born of woman, who has to carry on the race. has childbirth pains because Eve tempted Adam in the Garden of Eden?

A—I will believe just what the Bible says. I ask to put that in the language of the Bible, for I prefer that to your language. Read the Bible and I will answer.

Q—All right, I will do that: “And I will put enmity between thee and the woman”—that is referring to the serpent?

A—The serpent.

Q—(*Reading*):

and between thy seed and her seed; it shall bruise thy head, and thou shalt bruise his heel. Unto the woman he said, I will greatly multiply thy sorrow and thy conception; in sorrow thou shalt bring forth children; and thy desire shall be to thy husband, and he shall rule over thee.

That is right, is it?

A—I accept it as it is.

Q—And you believe that came about because Eve tempted Adam to eat the fruit?

A—Just as it says.

Q—And you believe that is the reason that God made the serpent to go on his belly after he tempted Eve?

A—I believe the Bible as it is, and I do not permit you to put your language in the place of the language of the Almighty. You read that Bible and ask me questions, and I will answer them. I will not answer your questions

Q—I will read it to you from the Bible: in your language.

And the Lord God said unto the serpent, because thou hast done this, thou art cursed above all cattle, and above every beast of the field; upon thy belly shalt thou go and dust shalt thou eat all the days of thy life.

Do you think that is why the serpent is compelled to crawl upon his belly?

A—I believe that.

Q—Have you any idea how the snake went before that time?

A—No, sir.

Q—Do you know whether he walked on his tail or not?

A—No, sir. I have no way to know. (*Laughter in audience.*)

Q—Now, you refer to the cloud that was put in the heaven after the flood as the rainbow. Do you believe in that?

A—Read it.

Q—All right, Mr. Bryan, I will read it for you.

Mr. Bryan: Your honor, I think I can shorten this testimony. The only purpose Mr. Darrow has is to slur at the Bible, but I will answer his question. I will answer it all at once, and I have no objection in the world, I want the world to know that this man, who does not believe in a God, is trying to use a court in Tennessee—

Mr. Darrow: I object to that.

Mr. Bryan (continuing): —to slur at it, and while it will require time, I am willing to take it.

Mr. Darrow: I object to your statement. I am examining you on your fool ideas that no intelligent Christian on earth believes.

(*The court is adjourned. On the following day Bryan's testimony is struck from the records.*)

CURIOUS AND UNUSUAL DEATHS

INTRODUCTION

To Mark Twain is attributed the unusual discovery that more persons die in bed than from riding on trains. However, one is interested in deaths from train wrecks for that is an unusual way to have one's life end. Our interest is centered about curious things. The more unusual it is the longer it is remembered.

The following pages contain a discussion of about 75 detailed cases and brief mention of nearly 170 other deaths and several close shaves. There are many celebrated examples that have been purposely omitted because they are probably already known to the reader or they are mentioned in other Little Blue Books. An example is "Jack the Ripper" and his victims, discussed in "Historic Crimes and Criminals."

These are the stories one reads with interest in the daily newspapers. In several cases they are "the inside story" that was not printed in the papers. The author of this Little Blue Book personally investigated some of the deaths as a newspaper reporter. Others were given publicity in various newspapers and periodicals.

A FEW CURIOUS INCIDENTS

One need not fear death from most of the causes mentioned under this head. They form but a microscopic minority of fatalities. Most of us, being orderly, will die in an orderly way. *It looked like murder.* Early one morning

4 CURIOUS AND UNUSUAL DEATHS

near a suburb of Chicago a youth was found in a field fatally wounded. He had been shot through the head by a .22 caliber rifle lying several feet from the body. He died without regaining consciousness and nothing was found about the body by which to identify him.

The wounded man lay near a fence and the soft plowed ground torn up about him led the authorities to suspect that there had been a struggle and that the young man might have been slain or accidentally killed in a scuffle over the gun.

A companion was sought. Upon re-examining the young man's clothing a telephone number was found written on his hat-band, although it was nearly obliterated by bloodstains. The number, a Chicago exchange, was called and it was found to be the home of a boy who had been missing overnight. The mother identified the body as that of her son. She said that he had left home early the morning before to go job hunting. But the gun was not his—the mother said her son had never owned a rifle.

When the newspapers published the story the owner of the gun, a friend of the dead youth, appeared before the police and explained that the gun had been borrowed by the young man who had decided to go rabbit hunting the afternoon before his death.

The death was then explained as an accidental discharge of the gun as the youth was dragging or pulling it through the fence. He had lain unconscious on the ground overnight. The

torn up ground was caused, it was thought, by the threshing about of the wounded man.

The Unidentified Man. Early one summer in a Kansas town the body of a man was found floating on the river. He was identified as a man who had applied at the government employment bureau for work a few days before. The father of this man was notified.

When the father arrived he was surprised to find his son, whom he believed to be dead, loafing about the railroad station. Upon hearing the story, the son decided that it might have been a second son who was found. A telegram to the second son's last address brought a response, however, and the authorities were forced to take another look at the body.

The corpse was badly decomposed, but still the authorities thought they recognized it as that of another man known to the police. He was buried in Potter's Field. Two months later the "dead" man was picked up by the police for vagrancy. Now the authorities do not know whom they buried.

The Clock That Never Ran Down. An interesting coincidence which has never been printed happened in a western town. A prominent citizen owned a clock which was highly prized by him as an antique. For years he took care of the clock, winding it himself and allowing no other hands to touch it. To the knowledge of his family the clock had not stopped in many years.

In his declining years he took sick and as he lay on his death bed the clock ran down.

Of his wife, children and all of his relatives assembled, no one knew how to wind the clock.

Finally a local jeweler was summoned who mastered the intricate mechanism of the old time piece and started the clock going again. Soon after the clock was wound, the first time by hands other than its owner's since it came into the family, the sick man died.

Swimming With a Corpse. - A rather gruesome episode happened in another town at a municipal swimming pool. A young man and a friend were swimming one hot summer afternoon when they heard a little girl say, "A boy dived in and didn't come up!"

A score of persons were swimming at the time and one might easily have lost track of a boy in the continually diving and splashing crowd in the small pool. But the girl insisted and about an hour after her first remark the words were carried to the manager of the pool.

The young man and his friend were in the dressing room but the manager approached them and asked if they would again don their bathing suits and search the pool for the body. He had no life guard on duty.

"There's a white saddle horse outside," the manager said, "and it might belong to someone who is in there—dead!"

The young man plunged into the pool, thinking that it was all nonsense. To his surprise he swam directly into the cold body.

Perhaps thirty or more people had been in and out of the pool during the time since the little girl's first remark and not one of them

had knowingly touched the drowned boy, nor knew they were swimming with a dead person.

Six Inches From Saving a Life. In the spring one year when waters were high a young man and two companions went canoeing. While they were in the middle of the river the canoe suddenly upset.

One of the young men, an expert swimmer, followed behind his two companions as they struck out for shore. When he arrived within a few yards of the shore he turned about and struck out after the canoe, to save it, his friends thought.

The swift current had carried the boat far down the river and when the young man reached the center of the stream, his companions observed that he was evidently in distress.

They secured a rope from a nearby house and rushed to a long bridge which crossed the river several hundred yards below where their companion was struggling. This they dropped down from the bridge.

The young man was nearly exhausted by the time the current carried him to the bridge and he extended his hand to grasp the rope. But it was six inches too short and the youth sank to his death.

Murders His Chum. Two youths at a southern university were close friends. One of them was in financial difficulties and he determined to turn bandit in order to secure enough money to continue school. He purchased a gun and

waited on a dark street for a victim to approach.

A man came along.

"Stick 'em up!" commanded the youth.

A struggle followed. Two shots were fired.

When the robber was captured he learned that he had slain his chum.

Feuds. Feuds are not uncommon, even in this day and age. A quarrel which had lasted for generations between the Lovato and Medina families at Dixon, New Mexico, flared up when the two families met at a country wedding dance. In a gun battle three of the Medina brothers were fatally wounded. Their victors, three Lovato brothers, were held on a murder charge.

In Crossett, Arkansas, two well known and highly respected citizens settled their differences in the good old southern way, by shooting it out at close range. The duel occurred in the heart of the city. Both men were killed and a bystander wounded in the neck. One man was said to have been paying too much attention to the wife of the other.

Miscellaneous Deaths and Escapes. In a southern town a youth became exhausted while swimming in a large pool. He sank to the bottom where he gave himself a push to the surface with his feet. When he reached the top he would shout, "Help!" and take a deep breath and repeat the process. After doing this several times he attracted the attention of the life guard who rescued him. His presence of mind saved his life.

A woman, 78 years old, wandered into a river one night and died of the shock. It was believed that she fell asleep while sitting on her front porch and was sleepwalking. She was found by a searching party.

At the Indianapolis speedway a man was once fatally injured in a race without knowing that he was seriously hurt. The timing wire which automatically registered the cars as they sped over it was broken by a car as it sped by the judges stand. The loose end flew up and slashed the neck of the driver of another car closely following the first. The intense excitement of the race caused the driver not to notice his injury until he was nearly exhausted from loss of blood. He died before aid could be administered.

A curious will was left by a woman of Los Angeles, California, bequeathing all her possessions to her dog. The strange document, containing many misspelled words, ran as follows:

Los Angeles, Cal.
Nov. 1, 1925.

In case of my death I leave all I possess or oghn, both real and persnel, to my dog, Dick, a lleuim setter, black and white. I naim Mrs. Ema Foster of 60 and Monte Viste as guardine and care taker of my dog dick, cats and chickens to be humanely disposed of.

In Dubuque, Iowa, a man 101 years old, died jumping after a toy balloon. He gave the balloon to his grandson as a Christmas gift. One afternoon the boy let it get away from him and the aged gentleman died from over-exertion as he jumped after it.

SOME MARTYRS

There has been a good deal of controversy as to the justification of dying for a cause. Robert Ingersoll once said that in preference to burning at the stake he would admit belief in any God. It is true that many lives have been sacrificed in the furthering of useless and trivial causes. For every martyr who has really contributed to the welfare of mankind there have been many who have given their lives for false ideals and in vain.

Martyrs to Science. Here listed are the names of men whose contributions to the human race are priceless and who died in learning the secrets of nature—they are the self-sacrificing research workers of medical science. The most important martyrs on the records of the New York Academy of Medicine and the Bureau of Medical Information will be given.

It has been at a great cost that science has enabled mankind to battle the parasites that cause fevers and plagues. Knowing that death was approaching many of these heroes continued their work until they were overcome. In 1900 Jesse W. Lazear, a member of the United States army yellow fever commission, volunteered to allow himself to be bitten by a mosquito to test the transmission of the disease. Dr. Lazear told of his symptoms on his death bed. James Carroll also subjected himself to the bite of the yellow fever mosquitoes in 1900 in Cuba. He died seven years later from lesions of the heart which were believed to have been induced from the disease.

In 1928 Hideyo Noguchi of Japan, a member of the Rockefeller foundation, died a martyr to his experimenting with yellow fever in Africa. He discovered the parasite of yellow fever and later contracted the disease.

Dr. Howard Taylor Ricketts of Chicago and Philadelphia died in Mexico from an attack of typhus fever in 1910. He was studying the disease and while in Mexico he proved that tabardillo, a Mexican fever was a manifestation of typhus fever and that it was transmitted by the body louse.

In 1927 Dr. Adrian Stokes of Ireland died in West Africa from the yellow fever while attached to the Rockefeller foundation and while studying the disease.

Two other fever victims were Thomas B. McClintock who died in Washington, D. C., of Rocky Mountain fever, a disease which he had been studying, in 1915, and Dr. Tito Carbone of Italy who died in 1904 of Maltese fever, the germ of which he had been studying.

Dr. William S. Halstead, an American surgeon, died from undermined health, the result of making tests on himself by injecting cocaine to demonstrate the principle of nerve blocking. He became addicted to the drug and ruined his health in breaking himself of the habit. Halstead was the creator of the modern method of local anesthesia. He died in 1922.

The most recent victim of his own experimenting was Dr. Joseph Goldberger, who died in January, 1929, of an unknown affliction. He had suffered from typhus fever, yellow fever

and dengue fever at various times while experimenting with these diseases. He was studying the dietary cause of pellagra when he died.

Roentgen or X-ray and radium experimenters have paid heavy toll with their lives for their research. In 1910 Mihran Krikar Kassablan of Philadelphia died from constant exposure to Roentgen-rays. Walter James Dodd of Boston, a pioneer Roentgenologist, died in 1916 of burns.

The inventor of the Caldwell liquid interrupter and other X-ray appliances, Dr. Eugene Wilson Caldwell of Savannah, Missouri, died in 1918 from repeated burns. M. Demenitroux, former aid of Professor and Mme. Curie, died in 1925 of the tortures of a disease contracted through radium experiments.

One of the most plucky X-ray surgeons who ever lived was Professor J. Bergonne of France, who died in 1925 of burns received in his Roentgen-ray experiments. Although the professor had both his right arm and left hand amputated at different times because of burns, he continued his experiments until he died. Bergonne invented the magnet which was used to extract bullets and shell fragments from wounded soldiers during the World War. He also was the inventor of an electric vibrator which was used with some success in treating shell-shocked veterans.

Negro Lynchings. It is undoubtedly true that innocent men have been victims of race hatred. These men are in a way unwilling martyrs. There is on record a case of a woman who deliberately made up a story that a Negro at-

tacked her, and identified an innocent man as the one who committed the imaginary crime.

The innocent Negro was transferred to the city jail, where he awaited trial. A mob was formed which stormed the jail and abducted him. The leaders of the mob, in order to inspire terror in the hearts of the black citizens of the community, suggested that the man be hung in front of a hotel in the very heart of the business district.

The Negro was saved by one of the sane individuals of the town, a judge, who arrived on the scene with three or four other men who were opposed to mob violence, just as the rope was being placed about the trembling Negro's neck.

The judge argued with the mob while his friends strategically surrounded the Negro. At a given signal the friends of the judge cut the rope and rushed the Negro into the hotel and out the back door. The judge and one or two others blocked the entrance until the escape had been made.

Later the Negro was taken secretly to another town. A few years later the woman's story was openly discredited and the Negro returned and lived the rest of his days unmolested among those who once threatened his life.

At the time, however, the sparks of race hatred so ignited the spirit of mob violence that race rioting was barely avoided and it did lead to the lynching of another Negro.

Two days after the attempted lynching a white janitor at a railroad station discovered a colored hobo sleeping early one morning in

the waiting room. The white man ordered him out. The Negro was an ugly character and he drew a razor and slashed the janitor several times about the neck and shoulders. The police arrested the Negro and took him to jail.

Although the white man's wounds were not serious, a jury was hastily paneled and a trial held that morning so that the Negro could be taken out of town before a mob could be assembled. By afternoon the Negro was sentenced to a term in the state penitentiary. He was taken to the railroad station and placed on a train.

The mob, hearing of the law's quick action, assembled and ran to the station. There they overpowered the deputies and the engineer of the train and dragged the Negro out of the coach. He was hanged on a telegraph pole in front of the station.

It is curious, that although the leaders of the mob could have been easily identified, no action was ever taken against them outside of the usual half-hearted "investigation." This happened more than 35 years ago.

Martyrs to Sport. There are other cases of unwilling, and perhaps foolish, martyrs. At the close of the Michigan deer hunting season in 1928 eight hunters had sacrificed their lives so that 4,000 deer could be killed.

The realm of sport has claimed other martyrs. Football and baseball casualties and deaths from over-exertion occur every year. An article in *Plain Talk* in 1928 declared that of 50 bare-knuckle prize fighters of by-gone years, 23 were champions, the average age of

death was 43.24 years—a time when most men are in their prime. The deaths of 35 could be traced either to punishment in the ring, excessive training or dissipation. Only two of these prize fighters died wealthy and six well-to-do, while 32 were poverty stricken at the time of their death.

In a list of 50 glove fighters, including 15 champions, the average age of death was 39.12 years. Two were wealthy and two died well-to-do, while 32 went to their graves penniless. Thirty-five died as a result of punishment in the ring, excessive training or dissipation.

A Near Martyr and a Peacemaker. A near martyr was the mayor of Cicero, Illinois, the home of gangsters and gunmen. Imagine his varied feelings one night when he found 12 sticks of dynamite planted under his front porch. A fuse an inch long was connected to the explosives. It had evidently spluttered out just before it reached the charge, thus saving the mayor and his family from death or serious injury.

Also in the category of curious martyrs was a mother of Ashland, Kentucky, who rushed out of her house to stop a quarrel between her two daughters and some of the neighbor's children. She dropped dead from heart trouble during the excitement.

SELF DESTRUCTION

Edgar Allan Poe deplored the fact that there was little originality shown by self-destructionists of his time. There are very few unusual methods of suicide. In America shooting one's

self is the favorite method, hanging is second and poisoning runs third. Jumping from high places and drowning are also common methods of those who take their own lives.

More men kill themselves than women. Men die violently by shooting or hanging. Poisoning is the favorite method used by women. As a rule, women select methods that will not mar their features.

Student Suicides. During the winter and spring of 1927 America was startled by an epidemic of a score of suicides among high school and college students in prominent institutions. Men and women, attending Princeton, Yale, University of Chicago, University of Illinois, and University of Wisconsin joined in the latest college craze of dying by their own hands.

Many newspapers attributed the suicides to "the growth of modern materialism." Education was decried but it cannot be said that education has been the cause of the somewhat common epidemics of suicides among Chinese and Japanese girls. It is also interesting to note that philosophers and scientists who are most pessimistic about a hereafter and who are the most materialistic do not contemplate self destruction.

One student found life not worth living, hollow, tawdry, a snare and a delusion. Another announced that he had done everything possible on this earth and he could see no reason for living longer. A third was interested in spiritualism, curious about the possibility of

communicating from "beyond." Three others simply killed themselves without telling why.

One of the latter three, a youth who wrapped a rope around his neck and hanged himself, had received a note from his parents that day taking him to task for overdrawing his bank account. In the other two cases it is presumed that curiosity played a large part—they wanted to know "what death was like."

A high school boy of Oakland, California, killed himself with a rifle. His mother ascribed the act to a mild reproof for a bad grade in deportment at school. He left an incoherent and muddled note which said he was shooting himself "to save his mother and sister from humiliation."

A sixteen-year-old student in a Washington, D. C., high school shot himself with a revolver. He was walking through the corridors of the school while classes were in session. A friend seeing him stopped him.

"Where are you going?" the friend asked.

"I'm going to hell!" the boy answered nonchalantly, drawing the revolver out of his pocket and blowing his brains out. His mother, teaching in a room nearby, heard the shot.

The United Press carried a dispatch to the effect that "the American student suicide movement has reached England," and cited the case of a Cambridge undergraduate who had hanged himself.

Figures compiled by the Metropolitan Life Insurance Company showed that suicide among minors was not on the increase during the winter and spring of 1927. in spite of the suicide

epidemic. Two percent of the suicides during this time were among minors, while in 1926 the rate was five percent. The rate had been on a downward trend since 1900.

Between 15 and 20 years is the common age for minors to take their lives, according to the figures. The rate for girls is usually higher than for boys. During 1921, 1924, 1925 and 1926 the rate among boys was the highest.

However, there are still more suicides than murders in the United States. Even in the large cities, those of more than 100,000 population, in spite of gangsters and thugs, there were 16.3 suicides to 10.4 homicides in 1927 per 100,000 population. The moral of this is—watch yourself closer than you watch your neighbor if you expect to be murdered.

A Negro Suicide. Self destruction is an interesting phenomena of human nature. It is not common among other living animals. It is true that some insects practice it, but here it is a means of preservation of the species, It is martyrdom, rather than suicide.

Colored people declare that their race does not often indulge in self destruction. The writer recollects a case of a colored man's death that had all the earmarks of a suicide, although the coroner's jury didn't exactly call it such.

Stabbing and slashing one's throat is an unusual method of suicide in the present day. Leaving on the gas and drowning is far more common, even the rare occasion that someone throws himself in front of a train is more common than stabbing one's self. However, a cer-

tain colored man was found one morning in the basement of the store in which he had been working, half undressed lying in a pool of his own blood. His razor was clasped in his hand, indicating that he had cut his own throat.

His employer said that the man had been suffering from ill health and had been feeling downcast and despondent for several days. His colored friends insisted that the man did not commit suicide.

"Colored people never commit suicide," they declared.

So the coroner's jury obligingly turned in a verdict of: "Killed by hand or hands unknown."

Odd Cases of Suicide. Reasons for committing suicide are often most trivial. A man in Groveville, New Jersey, killed himself because his radio wouldn't function properly. He worked on it until late at night, then in disgust, he quit suddenly, ran out into his back yard and hanged himself.

On January 4, 1919, a disappointed lover ran amuck near Little Sioux, Iowa, and shot himself and five others to death in a farmhouse.

On March 14 of the same year a man, 46 years old, ended his life by leaping from the New York City side of the Manhattan Bridge. His suicide followed the unsuccessful attempt on January 23 of a sailor who jumped from the same bridge. The sailor suffered from immersion and a bruised back. New York prosecutes attempted suicide as a crime.

One winter a woman of the streets in a western town went to the river for the dreadful

purpose of committing suicide. Imagine her chagrin when, after having jumped in, she found the water only knee deep. She waded out and it is presumed that she is still managing to struggle along without dying.

In another town a parachute jumper who was barnstorming in that vicinity got acquainted with a young woman on Friday evening. The next day the two were married. On Sunday he was killed jumping from a plane. His "chute" was left dangling on the wing of the plane. A few days later a woman turned up who claimed to be his first wife. This made him a bigamist. Then another wife was heard from. This made the man a polygamist. One of the airplane mechanics then offered the suggestion that it might have been a suicide.

Disfiguring One's Self. We have mentioned above that women commit suicide by methods that will not spoil their looks. While it does not come under the heading of suicide there is an example of a young man who disfigured himself to avoid suspicion of a crime falling on him.

One morning his foster parents were made violently ill after eating oatmeal. The boy was not taken sick. The incident was reported to the police as an attempt upon the lives of the family.

The youth was questioned closely but nothing was learned that might have led the police to believe he was guilty of the poisoning.

A few weeks later the boy came home nearly blinded and his face badly burned with acid which he claimed was thrown by a man who

had passed him in another automobile as he drove the family car home from school.

This time the police questioned the youth more fully and the boy finally confessed that he had been experimenting with some chemicals. He decided to try a mild poison on his foster parents and he had placed it in the oatmeal.

When the police questioned him the first time he feared that he was suspected and so he had thrown the acid on himself to avert suspicion.

NEWSPAPER SENSATIONS

Hardly a fortnight goes by without a new sensation in the columns of the newspapers. Only a few of the more classical examples will be cited here and of these, only those dealing with death.

Famous Murders. The famous murders of recent years must only be mentioned briefly. To go into the subject in detail would require many volumes by itself.

The newspaper space given to murders and murder trials is tremendous. Concerning the Hall-Mills trial alone 5,000,000 words were written and sent from Somerville during the first eleven days of the trial. More than 200 newspapermen and newspaperwomen were interned in the New Jersey village for the duration of the trial.

On the first day 130,175 words were telegraphed in eight hours. Twenty-eight Western Union operators, sixty leased wires and the largest portable telegraph switchboard in the

world were used in the transmission of the news to papers. On the third floor of the courthouse an electric typewriter animated many others in newspaper offices all over the country.

Eight daily newspapers leased houses for the use of their "Somerville staffs." The *New York Daily News* had 16 men on the job and the *Daily Mirror* had 13. Both are tabloid newspapers.

Ten photographers, all that were allowed, were in the front line of the court room with their flashlights and cameras. Two motorcycles rushed the plates from the scene of the trial to the nearest rapid transit station to be carried to newspaper and syndicate offices in New York City.

It is estimated that 60,000,000 persons followed the trial through the news columns. Yes, the public is interested in murder.

A brief summary of some of the most sensational trials of the last decade will be given here.

Leopold-Loeb. Nathan Leopold and Richard Loeb confessed to the slaying of Bobby Franks "for a thrill." They were given a life sentence in the Illinois state penitentiary.

The Shepherd Case. William D. Shepherd was accused of killing his ward, W. N. McClintock, by means of typhoid germs. He was acquitted.

Sacco-Vanzetti. Nicola Sacco and Bartolomeo Vanzetti were executed on August 23, 1927. They had been sentenced on scanty evidence in a muddled trial for a murder and holdup at South Braintree, Massachusetts. There was consider-

able agitation throughout the world at the time, as it was claimed that the men were being executed because they were "radicals." Sacco was an anarchist. The October 31, 1928, issue of *The Outlook* offers testimony which if true (and it appears quite authentic) would clear Vanzetti for one of the crimes for which he was convicted.

Snyder-Gray. Ruth Brown Snyder and Henry Judd Gray were executed for the killing of Mrs. Snyder's husband, Albert Snyder, editor of *Motorboating*.

Gerald Chapman. A "master mind" type of criminal executed for the murder of James Skelly during a mail robbery in New Britain, Connecticut. At one time he escaped from the federal penitentiary at Atlanta, Georgia.

Hickman. A youth who kidnapped Marian Parker, 12 years old, and secured \$1,500 ransom from her father, a Los Angeles banker. Then he fiendishly murdered her, hacked off her legs and delivered the dead body to her parent. He was captured, he confessed and he was executed.

Hall-Mills. A mystery murder in which a minister, Mr. Hall, was killed in company with Mrs. Mills, a choir leader. The minister's wife was suspected. No one was convicted but the case was filled with details not often found outside the most thrilling detective stories.

Witches Make Whoopee. We will cite, also, a well known trial that had an odd background. It is the story of the murder, rather than the

trial itself which deserves mention in a collection of "Curious and Unusual Deaths."

This particular case is the "witch murder," as the papers called it, of York, Pennsylvania. It was interesting in that it throws light on superstitious practices which exist in a modern world.

The story of the murder was related by Wilbert Hess, who with John Blymyer and John Curry, was held for the slaying of Nelson D. Rehmeier.

The three men went to the home of Rehmeier who had been credited with practicing witchcraft, for the purpose of securing a lock of his hair with which to break a "spell" it was alleged he had cast over them.

Rehmeier appeared at a window in response to a knock at the door. Blymyer, who was also said to be a "witch," asked for a book, "My Lost Friend." When Rehmeier came to the door Blymyer seized him and hit him over the head with a piece of wood.

Blymyer then handed the block of wood to Hess who hit Rehmeier twice again. Curry took a halter that was nearby and tied the legs of the "witch" so that they could cut a lock of his hair. Rehmeier continued to struggle and so Blymyer, who must have been a tenderhearted person, floored him with a chair. Curry tied a rope around Rehmeier's neck.

"After the rope was pulled tight he stopped breathing," Hess said in his confession. "I guess he was dead."

The murderers set fire to the body and fled.

Trapped in a Cave. Another famous death in recent years, which was not a murder and yet was a newspaper sensation, was that of Floyd Collins, a cave explorer who was imprisoned in a Kentucky cave.

Collins was caught in Sand Cave, near Cave City, Kentucky, when a heavy boulder fell on his foot January 30, 1925. He was searching for a way into Mammoth Cave. All efforts to release him failed. He was dead when his body was reached on February 16. The remains were removed on April 23.

This chapter takes us into deep water. While speaking of newspaper sensations we might go on telling of marine disasters, deaths of trans-oceanic fliers, dirigible explosions, earthquakes, fire, flood, tornadoes and other occurrences (including husband killing) without end that have occupied newspaper headlines in years past. A line must be drawn somewhere.

FAMOUS LAST WORDS

The reputed last words of noted men and women must be taken with a grain of salt. In many cases the men and women who uttered them have become so idealized in history that it is quite possible that they said nothing of the kind. The words may only be what a witness "thought" was said—or what someone else "thought" ought to be said. One can hardly believe all of them are true, but who is to say which ones are and which are not?

Dying Words of Brave Men and Women. In some cases, such as that of Sir Philip Sidney,

an English soldier, we have two "last words." Sir Sidney fell mortally wounded on the battlefield. He asked for a drink. As a soldier handed him a bottle of water, Sir Sidney's eyes fell on a comrade who was also dying. The man's eyes looked longingly at the water bottle. Sir Sidney handed the flask to his dying comrade with the words: "Thy necessity is greater than mine."

In another place we read that Sir Sidney's last words were: "I would not change my joy for the empire of the world!" Perhaps he said both. Such a man deserves credit for both of them.

No one has tried to speak humorously at death. At least no dying words of exactly humorous content have come down to us. Many of them have a tinge of the ludicrous and have a certain extravagance which is akin to humor, a few are attempts at bravado, but no one has conscientiously attempted to create belly-laughter among those who watched him die. No one wants to have people laughing at him when he is dying.

Sir Walter Raleigh's remarks as he was about to be beheaded comes the closest to being genuinely humorous. But they are only the words of a debonair man of the world and they are not an attempt to be funny, nor is it spontaneous humor. He said: "It matters little how the head lieth."

There are several similar examples given in the list below.

The bloody sixteenth, seventeenth and eight-

eenth centuries gave the world the best dying words. A few Roman emperors also contributed to our list.

Statesmen, Patriots and Others

"It is well."—George Washington.

"Then I am safe."—Oliver Cromwell.

"Independence forever."—John Adams.

"Long live anarchy! Farewell, mother!"—Nicola Sacco.

"It is the last of earth."—John Quincy Adams.

"I have endeavored to do my duty."—Taylor.

"Gentlemen of the jury, you will now consider your verdict!"—Lord Tenterden.

"To die for liberty is a pleasure and not a pain."—Marco Bozzaris.

"Let me die to the sounds of delicious music."—Mirabeau.

"Remorse! Remorse! Write it! Write it! Larger! Larger!"—John Randolph.

"Give Dayrolles a chair."—Lord Chesterfield.

Philosophers and Scientists.

"The artery ceases to beat."—Albrecht von Haller (a Swiss anatomist).

"Let the light enter."—Goethe.

"Refresh me with great thought."—Johann von Herder (German critic and poet).

"Taking a leap in the dark. O, mystery!"—Thomas Paine.

"I am taking a fearful leap in the dark."—Thomas Hobbes.

Preachers and Heretics.

"I have peace."—Charles Henry Parkhurst.

"I shall be happy."—Archbishop Sharp.

"What! Is there no bribing death?"—Cardinal Beaufort.

"My days are past as a shadow that returns not."—Richard Hooker.

"I want nothing and I am looking for nothing, but Heaven."—Philip Melanchthon.

"Be of good comfort, brother, for we shall this day light such a candle in England as shall never be put out."—Hugh Latimer to Nicholas Ridley (both burned at the stake as heretics).

Poets, Artists, Musicians and Writers.

"I must sleep now."—Lord Byron.

"I am about to die."—Samuel Johnson.

"I feel as if I were myself again."—Sir Walter Scott.

"Clasp my hand, my dear friend; I die!"—Count Vittorio Alfieri (Piedmontese poet).

"A dying man can do nothing easy."—Benjamin Franklin.

"My beautiful flowers, my lovely flowers."—Richter.

"I feel the desire growing over me."—John Keats.

"Let me hear those notes so long my solace and delight."—Mozart.

"We are all going to Heaven, and Van Dyke is of the company."—Thomas Gainsborough.

Kings and Emperors.

"Is this your fidelity?"—Nero to his servant.

"And this is death?"—George IV.

"An emperor should die standing."—Vespasian.

"Don't let poor Nellie starve."—Charles II.

"I thought that dying had been more difficult."—Louis XIV.

"Farewell, Livia, and ever remember our long union."—Augustus Caesar.

"I have seen all things, and all things are of little value."—Alexander Severus.

"*Et tu Brute?*"—(And you Brutus?)—Julius Caesar.

Soldiers and Sailors

"Don't give up the ship!"—James Lawrence.

"I would not change my joy for the empire of the world."—Sir Philip Sidney.

"I thank God I have done my duty."—Lord Nelson (killed in action at Trafalgar).

"It matters little how the head lieth."—Sir Walter Raleigh.

"James, take good care of the horse."—General Winfield Scott.

"We are as near Heaven by sea as by land."—Sir Humphrey Gilbert.

"This is the last flickering of a lamp that has long been burning."—General John Ellis Wool.

"Let us cross over the river and rest under the shade of the trees."—Stonewall Jackson.

"I regret that I have but one life to give for my country."—Nathan Hale.

Brave Women

"I die through you!"—Joan of Arc to Pierre Cauchon of Beauvais.

"It is small, very small."—Anne Boleyn (alluding to her neck).

"I do not sleep. I wish to meet death awake."—Maria Teresa.

"O Liberty, Liberty! How many crimes are committed in thy name!"—Madam Roland (executed).

There is a story behind each one of those utterances. Those people died well, all of them.

The Raymond Schoolhouse. While we are on the subject of last words it might be well to mention the episode concerning S. N. Wood, one of the most conspicuous characters in the territorial history of Kansas, and the schoolhouse at Raymond, Kansas. It was one of the huge jokes of the day.

The Santa Fe railroad reached Hutchinson June 10, 1872, and from there it crossed the prairies to Great Bend and reached that town during July, 1872. Midway between Hutchinson and Great Bend is the site of Raymond, which was a town while the railroad was there.

Gamblers, dance hall girls and the riff-raff of the frontier settled at Raymond. Possibly a dozen persons really had legitimate businesses in the place while it was a town.

One morning a notice was placed (at the railroad station, presumably) in S. N. Wood's handwriting calling for an election of school bonds to build a schoolhouse!

On July 30, when the election was held there were about 300 persons in Raymond. On August 26, when 20 bonds of \$500 each were issued as a result of the election, the population of Raymond had dwindled to S. N. Wood and 24 others.

After a time Wood sold the bonds for \$750

each and, since he had the contract to build the schoolhouse, he pocketed the whole amount.

The contract called for a school with a "belfry and a good bell that could be heard for two miles." The records of the superintendent of Rice County schools are incomplete before 1885. However, the episode is mentioned in a footnote of Kansas Historical Collections, Volume XII, which declares that the district was 12 miles long and six miles wide—and the bell was good for only a two-mile radius.

The state legislature investigated the case in 1876 and found that no school had been built. Suit was brought against Wood and two banks which were used by Wood in disposing of the bonds, but the money was never procured.

Wood was killed in a gun battle over the location of a county-seat at Hugoton, Kansas, on June 23, 1891. His dying words were said to be: "I bind myself to build Raymond School District a house for school purposes, and I will place on it a bell which can be heard two miles down the Arkansas." It was quite a speech for a dying man to make.

MELODRAMA IN REAL LIFE—CONCLUSION

Perhaps the most melodramatic death in this entire collection is the one we have saved for the last. It is the tale of a girl in her teens who was madly in love with a railroad engineer.

They had gone together for two years. On days when he was away she would eagerly wait beside the tracks and watch for his return. As he passed by she would wave her handkerchief at him.

One day they had a quarrel, such as all lovers have. The engineer refused to make up with his sweetheart.

She waited by the tracks again for his return. The engineer saw her as he sped toward the town. But she did not wave her handkerchief at him this time. She had thrown herself in front of his train.

Conclusion. This, of course, is not an exhaustive study of interesting, unusual and curious deaths. Each day brings new and unusual tales of loss of life. The undertaker and the newspapers have an eye on all of us, for we may be the source of their next piece of merchandise.

We have omitted several cases of members of faith healing cults who died when they might have been saved, had they had a doctor. "What did people do before they had doctors?" the cultists inquire. Why, they died then, too.

Only a few conclusions may be made from the details gathered here. Unusual deaths are violent deaths (murders and suicides), as a rule, and they are deaths that might have been avoided. Of those mentioned in detail in this book about 50 percent are the fault of the person who died; about 40 percent are the result of someone else's carelessness or intention; about 10 percent were unavoidable.

Revoltng, disgusting and horrible deaths have been omitted. Only the most morbid persons would care to read them.

We might tell about the flour miller whose overalls caught in the machinery of his elevator—but we won't, we'll quit.

FOREWORD

Alfred A. Asgis (Temporary Chairman):
Ladies and Gentlemen. It gives me great pleasure to welcome you. It is indeed unique that in this age of money, movies, murder, and—mellowed moistures—that we should find so large an audience gathering to listen to what we are sure will be a philosophical debate on that much-talked-of subject, Man. As further evidence of an overwhelming interest in this topic, I am informed there are about 2000 persons outside who cannot gain admission to this hall.

I shall fulfill my function as temporary chairman and introduce the permanent chairman, a man who has won, by his experiments at Johns Hopkins, recognition for his new approach in the field of psychology, a man whom many consider as America's foremost scientist in psychological research. It may be said that, with the exception of Sigmund Freud in psychoanalysis, his approach has caused more intense discussion in the field of psychology, because of its revolutionary conclusions. I take great pleasure in introducing the permanent chairman of the evening, Dr. John B. Watson. (Applause).

ARE WE MACHINES?

INTRODUCTION

John B. Watson (Chairman): Ladies and Gentlemen. It is a little hard for me to see why a mere mortal should be put in as chairman, considering the interest in this subject and the brilliant men who are to speak to you this evening. I suppose I was chosen because I am a behaviorist (and, therefore, an objectionist), so that I would be an impartial chairman. Those of you who understand behaviorism will know how impartial a chairman I shall be. (Laughter.)

May I say, in passing, that I think this debate will unquestionably go down in history as one of the great debates of all time. The subject, "Is Man a Machine?" is more than a mere topic for discussion. It is a matter of vital interest to all of us; it is a matter which concerns our daily conduct.

You know, the behaviorist has a theory that language is merely a substitute for objects and for actions. Consequently, words spoken by others, and words that we speak ourselves, are just as potent in guiding our conduct as stick

and stone. Hence, these verbal concepts that we will get this evening will unquestionably change us. They are going to give us stimuli inside our environment, even though it be an internal environment in terms of words that you speak to yourself, which will unquestionably affect your actions.

After all, these verbal formulations, "Is Man a Machine?" ; "Man is a mere machine"; "Man is more than clay"; "He has a spark of the divine within him"—all of these verbal formulations, and many like them, are, unfortunately, gotten in childhood and never further scrutinized. So that the debate has practical significance in our daily life.

Again, this debate has a marvelous setting in the history of philosophy and in the history of psychology. Psychology has taken a rather peculiar position with respect to this question. It has been too bitter a controversy for psychologists to take the affirmative out and out, and when I speak of psychology now I mean since the early history of modern psychology beginning with Wundt and others. So you will find Wundt really straddling the question in his laboratory with a so-called psycho-physical parallelism. We have the machine, the body, and the central nervous system, and we have

also something that we wouldn't call mind or spirit, but something that he called consciousness. Now, these two things are unrelated, but they parallel one another so that when the body moves you have some kind of movement in consciousness.

Now, tonight one affects the other. You can see what an unsatisfactory hypothesis that is. You can see that it is a hypothesis which came from the history of philosophy which, after all, is a history of religion, and it was to satisfy those religious principles within some of us which made us adopt the idea of consciousness in place of the soul and to adopt psychophysical parallelism in place of mechanism.

I do feel that the speakers tonight should take this question rather logically, should give us some hard facts, should give us some kind of definitions. I have been struggling for a long time so far as I am concerned to find out what a man is, and yet, we glibly say, "Is Man a Machine?" I am sure our speakers will tell us a little bit about man. Is he just a group of ordinary chemicals put together in some kind of a happy but fortuitous way—put or got together in such a way that he could grow and reproduce his kind, could eat food and eliminate waste product? Or is man

something more than this happy conglomeration of chemicals worth, I believe, 98 cents, and if so, just what is it that comes in somewhere in this evolutionary scale? Is it some kind of spirit from the outside? Does somebody come in and breathe something upon this clay in order to make a man of it? Then again, the question of the machine is a very vital one. Ordinarily we define a machine as something that man made and that definition usually is thought to settle the question. Therefore, man is not a machine. I am sure you are too logically sophisticated ever to accept any such definition as that, but the speaker who affirms that we are machines will have to tell us just how complicated a machine can be.

Can we think logically of a machine which can observe that it has moved one of its members up or down or to the right or the left, a machine which can speak, a machine which can react the same to different stimuli at times, a machine which can act differently to the same stimuli at times? In other words, how complicated a machine can we conceive of as being in existence? The most complicated machine we know of today probably is the linotype machine or some of the radio

devices, but they are far, far off, of course, from reaching that complication that we find even in an amoeba.

Now, the question comes up, it seems to me, what are the logical implications of these two positions? If man is a machine, can we punish him? Can he be naughty? Can he be nice? Have we any right to force him into any kind of conduct either good or bad? If so, what justification have we then for any kind of a punishment theory whatsoever?

Well, I must leave the question at this point. I am sure I leave it in better hands. We must be on the lookout, though, for this. We must judge on the basis of logic. Both these gentlemen are eloquent. Both of these gentlemen know how to arouse the last spark of emotion within us, and when they arouse those emotions within us we lose our ability to judge. We want to keep our common sense because we feel that we are able to judge facts and, at any rate, to scrutinize their logical positions. It is my great pleasure to introduce the speaker who takes the negative on this side first, a gentleman who needs no introduction to this audience, who has written one of the most popular books, is one of America's most popular lecturers, Dr. Will Durant. (Applause.)

NEGATIVE PRESENTATION ADDRESS

Dr. Will Durant

Dr. Will Durant: Mr. Chairman, Mr. Darrow, Ladies and Gentlemen, I am glad that we are met in this historic hall, dedicated by Tschaikowsky a generation ago, and ennobled since by a hundred geniuses—I am glad that we are met here to consider the most far-reaching question in philosophy. That you are here is a sign that philosophy has undergone a resurrection, that it has escaped from the dead hand of scholasticism, and has made its re-entry into the living world.

Our question, like most debatable questions, is ambiguous. I take it for granted first that our question does not concern materialism, that we are discussing this evening not the constituents of the universe, but the methods and processes of the world. Further, I shall interpret the term machine, or (as the theory of living machines is called in philosophy) the theory of mechanism, as meaning that man and all living things are mechanical in the sense that their behavior can be entirely explained in mechanical terms, on the principles

that seem to hold good in industry, in physics, and in chemistry. That is the sense in which the word "mechanism" is used in philosophy, and it is to that aspect of the question that I shall confine myself in this first period.

But it is possible that our beloved machine here may choose to adopt the other slant of this question, the theory of determinism, that man in all his actions and all his thoughts is irrevocably determined and compelled by conditions over which he has no control, and to which he contributes nothing. If Mr. Darrow chooses to exhume that almost extinct debate from the cemetery of dead problems, I shall be glad in the second round to follow him there and explain to him why I believe not only that he is something far subtler and livelier than a machine, but there is in him a spark of spontaneity and initiative which has contributed a considerable share to his adventurous and generous life.

It was the Industrial Revolution that filled the world with the strange notion that man is a machine. For first of all it accustomed the mind to dealing with machines and induced it more and more to think of causes not as biological, but as mechanical. The worker within factory wall, seeing the busy activity slip about

him on pulleys and revolve on wheels, forgot that older existence in which life had seemed to be a matter of seeds spontaneously sprouting from the soil, responding eagerly to every encouragement, and multiplying with an astounding and bountiful fertility. The world, which had once been a picture of growing plants and wilful children, of loving mothers and ambitious men, became for the modern mind a vast array of mechanisms, from the planets that circled mechanically around the sun to the crowds that flocked mechanically to be in at the death of a moving-picture star. Science was sure now that it had at last been admitted behind the curtains of the cosmic drama. It marveled at the unsuspected machinery which had shifted a thousand scenes and created a million delusions. It concluded in modest admiration that the property man was the real dramatist and that the wires were the play.

But again, the Industrial Revolution made cities, and cities made crowds, and crowds unmade men. Once again in the modern metropolis those conditions appeared which in the ancient Orient had shorn the individual of personality, reduced him to insignificance, and led him to a similar philosophy of fatalism

and despair. In this teeming welter of city population one became a number or a hand; the mind became an instrument for measuring, for weighing, for counting. A man became part of the machines he fed with fuel. Democracy, which had proposed to liberate the individual, became itself a mechanism, an enslaving chain of machines leading mindless masses to the ballot box. It was as useless for the individual to rebel against this system of wires and pulls and pushes as it had been for the individual to assert himself against the crushing conformities and crowds of the distant East. Even the leaders became a half-inanimate portion of the new contraption, almost as will-less and blind as the deluded people whose noses were quadrennially counted (or not counted) at the polls.

This abdication of personality is partly the cause of the secret sadness that lurks beneath the glitter and wit of the modern mind. To any one who had read his essay called "What is Man?" the pessimism of Mark Twain can no longer be mysterious or strange. For that unhappy humorist considered that all his joyous quips were the chemical result of the constitution of the primeval nebula (for what sins has it not been blamed?); and he believed

that the exuberant vitality of Tom Sawyer was simply the effervescence of a carbon compound. A little philosophy is a dangerous thing, and inclineth a man's mind to pessimism. It is said that the hilarious machine that created Huckleberry Finn had some trouble with his wife. But what woman could peaceably share her bed and board with an ebullient mechanism that looked upon her as a set of wheels wound up in the infancy of time and now unwinding itself, with superfluous sound and fury, to eternal impotence—and silence?

Doubtless the loss of our childhood faith has saddened us; and the double bereavement of every mature mind, that must lose the theological ideals of its infancy and then the political ideals of its youth, leaves the heart a little heavier with the weary weight of this unintelligible world. But part of the somber undertone beneath our superficial gayety is the result of the childish and culpable precipitancy of our own thought. It was not demanded of us that we should fly from a theology that scorned the natural basis of mind to a philosophy that ignored the mental developments of nature. It was not demanded of us that having abandoned our puerile pretense

at being the center and summit of the universe we should then prostrate ourselves before the machines in our factories and accept them as the Platonic ideas upon whose august models fortuitous variation had fashioned our souls. It was not required of us that we should abandon our share in the vitality of the world, in the undiscourageable expansiveness of life, in the persistent constructiveness of thought. But defeated on one part of the battle front, we retreated from the field in abject surrender and despair.

Was it necessary to yield so utterly? Is human behavior of the same order as the erosion of the hills, or the flight of the winds, or the obstinate tides of the sea? Is the inexhaustible solicitude of motherhood, the eager ambition of youth, the quiet tenderness of love merely a mechanical redistribution of physical force? Are the power and exuberance of life an appearance only? Is the passionate striving for beauty and perfection only a blind and fatal compulsion? Is the efficacy of consciousness only a delusion? Is the reality of will only a dream? Is man only a machine?

That is our question. It may comfort you to know that at the very moment when the theory of mechanism has reached down into

popular favor, it is being abandoned in a great many of the sciences, in biology (not in psychology), in physiology, even in physics itself. Lucien Poincare, one of the leading scientists of France, writes revealingly: "Today," he says, "the idea that all phenomena are capable of mechanical explanation is generally abandoned." The German scientist Cassiver says: "In modern physics the mechanical view of the world has been more and more superseded by the dynamic view." Le Bon, one of the founders of the atomic physics writes, "In spite of the efforts of thousands of workers, physiology has been able to tell us nothing of the nature of the forces that produce the phenomena of life. They have no analogy with those that are studied in physics."

Among the biologists the rejection of mechanism has become a common thing. Pavlow, the great Russian originator of the studies of conditioned reflexes, Driesch, the German embryologist, Haldane, professor of physiological chemistry in the University of Oxford—these are names that might make any mechanist pause. "The mechanistic theory," says Haldane, "has broken down. It no longer helps us in our physiological research. I should as soon think of going back to the mechani-

cal theory as I would of returning to the mythology of my Anglo-Saxon forefathers."

It is significant that Schopenhauer and Nietzsche, with all their hostility to traditional theology, rejected mechanism scornfully. Nietzsche asks the mechanist, "Is that world-interpretation alone right by which *you* maintain your position, by which investigation and work can go on scientifically in *your* sense? Do you really mean mechanical? Such an idea is a piece of grossness, provided it is not lunacy and idiocy. I say this in confidence to my friends the mechanists, who today like to hobnob with philosophers, and believe that mechanics is the teaching of the first and last laws upon which all existence must be built."

You perceive that it is possible for a man to be one of the most heretical rebels that the world has ever known, and yet to see that this ridiculous conception of vital behavior is a process of the same kind as those which we call mechanical, is a conception that comes to one only in an effort to leap back as far as possible from the theological hobgoblins of our youth. It is a defense-reaction, and once we have ceased to fear the recrudescence of theology in our own souls we shall be freer and

clearer in recognizing the shortcomings of this mechanical theory.

Yet, don't imagine for a moment that I wish to rest my case on authorities. Let us do our own thinking and face the phenomena directly for ourselves. Let us observe the unmechanical spontaneity, and purposiveness and selectiveness of life in locomotion, in digestion, in growth, in regeneration, in reproduction, in consciousness, and in genius.

Consider locomotion. Take some mechanism, say a toy automobile which will run resolutely enough when its spring has been wound and released by a human hand. Set it upon a smooth floor directly facing a slightly distant wall. Wind the spring, and release it. The car plunges forward against the wall. If the conditions are perfect it will rebound in the same line by which it advanced. It will stop for a moment and it will advance again and rebound in that same straight line, and continue forward and back in the same straight line until its artificial energy is completely spent.

By contrast let us perform in imagination an experiment that has been repeated time and again in biological laboratories. Take a glass bowl and fill it with water. Across the center

put a perfectly transparent glass partition just short enough to leave a narrow slit at either side. Into one half drop food. Into the other half drop some lowly organism, as simple as possible. Observe it under the microscope. It moves directly forward toward the food. It does not see the glass. It strikes the glass and rebounds in a straight line: apparently it is a machine. But suddenly it veers about, to the left or the right, and moves forward now at an angle, strikes the glass, rebounds. It veers again in the same direction. If it veered left the first time, it veers left again. It moves forward, strikes the glass, rebounds, again goes forward, goes through the partition, and finds the food. I ask you, can you conceive of a mechanical contraption of any kind that could possibly rival that judicious veering about, this appearance of self-directive purpose in the lowliest organism known to man?

Consider digestion. Some sensitive plants, like the *Dionaea* and the *Drosera*, close upon and absorb particles of food placed on the tissues. But when inedible substances are placed on those same leaves in the same way, even with the same form, the leaves do not respond. The amoeba normally rejects any-

thing that cannot serve for its nourishment. The cells of the human intestine show the same selectivity in their action. Each group of cells acts upon just one class of food and no other. Every cell in the human body chooses out of the blood stream the different and specific materials which it needs, and pours back into the blood the products of its own metabolic waste. Even at this lowly level you discover that remarkable ability to select which distinguishes the vital from the mechanical and which becomes ever more conscious and intelligent at each advance in evolution.

Consider growth. How could a machine grow? Why should it wish to grow? Was there ever a mechanism so marvelous that it might offer an analogy to the astounding self-development of life? Consider the lilies of the field: what enchanting power is it that frees them from their prison in the soil and lifts them, slowly, longingly toward the sun? Behold the swallows of the air: there are no cogs in them, no pulleys, and no wheels, and yet, we might say with Shelley:

If we could scorn hate, and pride and fear,
If we were things born not to shed a tear,
I know not why thy joy we ever should come near.

Here is a child. Why does it hunger and thirst for nourishment? Why does it reach

out with its soft hands to possess the world? See it grow. Out of simple food it makes dimples and curls and laughing eyes. See it for the first time fearfully and bravely trying to rise to a vertical dignity. Why should it long to stand and walk? Why should it tremble with perpetual curiosity, with fearless and insatiable ambition, watching and listening, touching and tasting, manipulating, and experimenting, observing and pondering, thinking, growing—until it weighs the earth and charts and measures the stars! What is this magic transfiguration of puberty that takes the boy and quiets and deepens him into a man?—that takes the girl and fashions her into a gentle beauty fairer than any art? Is it mechanical?

Consider regeneration. Cut off one ray of starfish and the center will regrow it. Cut off all of them, and the center will regrow them all. Cut out the center and the rays will regrow it. A machine out of order cannot repair its parts; it waits stupidly and senselessly for some living hand to come and restore it to order and efficacy. But these larger phenomena have been adequately described by Bergson: we set them aside. The simplest healing of the slightest wound is unmechanical and

marvelous enough for me. With what artistry the new cells fling themselves over the gap in the wound as if some cellular intelligence were guiding the beneficent work! We offer mechanical or chemical aids to these vital processes, but we know that they have the same relation to nature's healing power that marble or clay has to the sculptor's hand. We know that in some way which mechanism will never illuminate the energy and impetus of life will bear us on and through a thousand battles and through a thousand injuries until that divine vitality is spent and finds for itself another and a younger form.

Therefore consider reproduction. Here is a little ovum, invisible to the eye. Here is a restless sperm, moving about in worlds unrealized. Each of these microscopic cells is rich with the heredity of a thousand generations; each carries within it unique and subtle qualities of body and mind, impulses and dispositions and aptitudes, hunger and eagerness and love, perhaps in their plasm already lie the passion and patience of genius. Well, let that ovum and that sperm unite. Suddenly these possibilities become realities. The miracle of a new life begins. The fertilized cell, spurred on by some internal urgency, divides into two,

into four, into eight, into a hundred million cells that grow in unity even as their number mounts. A heart forms and begins to beat; a brain forms and begins to think; tiny hands and feet bud forth and stir in the womb. And then the little marvel matures and enters the world. Air and sound and cold and light impinge upon it. Its ears and eyes, and lips open; all its nerves tingle with sensation. Life has broken through death again, and pours itself lavishly into its new mould, joyous and young and strong once more.

Is it mechanical? Jacques Loeb thought he had proved that reproduction is mechanical by showing that he could take the unfertilized egg of a female sea urchin and cause it to develop to a certain point by stimulating it with the prick of a pin or shaking it in a salt solution. He concludes hilariously that reproduction was mechanical. No wonder Cicero said, "There is nothing so absurd but that it can be found in the book of some philosopher, or some scientist." (Laughter) Poor Jacques Loeb forgot that he had started with a living thing, the female's ovum. He forgot that she was not a machine, or at least, that he hadn't proved that she was. He forgot that he already had that divine urgency and vitality in the little egg.

If it developed of its own self, so much the more marvelous and unmechanical was it. The behavior of that unaided female in producing offspring without even the casual and undignified assistance to which Nature ungraciously limits the male was all the more astounding, and indicates, I suppose, that the emancipation of the female sex will in the coming century proceed to an unpleasant extreme.

Far more revealing than the experiments of Loeb were those of Hans Driesch. Driesch had been brought up in the laboratory of Ernst Haeckel at Jena. He had every inducement there to be a mechanist, but he discovered phenomena undreamed of in his master's philosophy. He took the fertilized ovum and cut it in half; the parts grew together and the ovum developed normally as if nothing had happened. Imagine what would have happened to a mechanical arrangement subjected to the same experiment—instead of the potency of life for growth and healing and self-repair and self-development!

But Driesch went further. He waited until that fertilized ovum had divided into two and then into four cells. He dragged apart the four cells, bloodily separated them, and then threw them together haphazard. They grew

into a normal being. He took another ovum and waited until the third division when it consisted of eight cells. He dragged them apart again and put them together with deliberate mal-adjustment; and they found a way to grow into a normal organism just the same.

Now, ladies and gentlemen, imagine a machine that cohabits with another machine to produce a third machine. Imagine that each machine is composed of millions of parts, each of which has the power of reproduction, and divides and multiplies and grows. Imagine that each machine separates one special part of itself to coalesce with a special part of another machine to form the model of a new machine. Imagine then that some gigantic Driesch comes along and cuts that model in half, and slaps the pieces together, and it develops unperturbed. Imagine that after it has gone on to some degree of development all the parts are taken asunder and then put together into deliberate chaos, and imagine that the machine goes on undisturbed in its operation as if nothing had happened—like a good Ford car! (Laughter) I ask you; was there ever a jollier hoax in science or philosophy? Was there ever in any religion, ancient, medieval or American,

any miracle that could compare with this majestic and monstrous myth?

We must omit the discussion of consciousness. Dr. Watson tells me that I have only five minutes. It is lucky for him. I was just about to show that consciousness is not mechanical and even that it exists. We will do that too perhaps, before the night is over.

Let us in conclusion consider genius. Here is the creative power of life in its clearest and highest form. Here is the last product of that glorious vitality which dances in the atom and fills the soil and the sea and the air with living and growing things. Here, in genius, mind turns around and remoulds the environment in which it grew. Man, the supposed machine, invents and operates machines, and craves beauty, and seeks truth, and creates social order, and rises to the loftiest reaches of morality and love. And I am asked to believe that the philosophic frenzy of Plato, the fine passion of Beethoven or Shakespeare, the divine intoxication of Spinoza, the godlike grandeur of Leonardo da Vinci's mind are mechanical processes, that the thoughts and the aspirations of these men were put into them with some mysterious time attachment by that mythical nebula a million millennia ago!

Well, I refuse to believe it. I cannot understand how any cautious and skeptical mind can so far forget itself as to accept so ridiculous a fairy story; and I wonder does Mr. Darrow realize how much credulity lies behind his unbelief, how much simple faith in untested and fallible authority? I do not believe that Chicago's leading citizen is a machine mechanically meditating upon its own machinery, an automaton automatically reflecting upon its own automatism. If I could believe that I could accept every fairy story ever told and every legend in every Bible ever written. After escaping from the infallibility of a church and from the infallibility of a book I refuse to surrender to the infallibility of a physicist who tries to squeeze into his test tubes and his narrow formulae all this budding and teeming world. It is time we should put an end to this new age of faith, and come to doubt even our scientists when they speak to us of miracles in terms of a childish mythology.

Biology is at a standstill today because it has been dealing with death rather than with life, with butterflies not on the wing, but on the pin, with preparations of dead tissues for microscopic slides, with specimens preserved

in alcohol. I look for the time biology will rebel against its domination by the narrow concepts of physics, when it will understand that the life which it is privileged to study and immediately feel comes far nearer to the basis of reality than the unseen molecules and atoms of natural science. And when biology is at last free from the dead hand of the mechanistic method it will come out of the laboratory into the world; it will transform human purposes and human conduct as physics has remade the face of the earth. And by holding life and growth as fundamental and sacred it will bring to an end the brutal tyranny of machinery over mankind. Slowly as we move out of the age of physics into the age of biology we shall come to see under these superficial mechanisms the throbbing and struggling life beneath. We shall come to understand that in some modest measure we may participate in what Whitman called "the procreant urge of the world," that we may write some lines at least in the drama of creation. Or as I phrased it fourteen years ago in a youthful escapade in poetry:

Through my window the voices of children playing,
Voices that drown the wisdom of my books
Stirring me strangely.

I sit compelled by the throbbing melody
Of their songs and their laughter.

My still body moves to the rhythm of their play;
I know that the holiness of life is within them,
That their play is the groping of Deity
And the overture of persistent creation.

I utter no sound, but my throat aches with the
longing.

O, God! to be with them, to laugh and to sing
And to play!

Softly now through the din of the voices
I hear tramping quietly the strong music of the
eternal.

I am filled with the mystical movement of life;
I am warm with the fever of currents that begin
not and end not;

I am merged with the river of leaping reality;
I am one with the riotous surge of sea,
And the madness of thunder, and the glory that
illuminates the sky.

Sweeps through me onward the resistless power of
all things,

Burns in me the hot breath of the forward flux of
the world;

Through me, if I will, creation;

In me—oh, in me!—God.

AFFIRMATIVE PRESENTATION ADDRESS

Clarence Darrow

Chairman Watson: You have heard the negative, pleasing, convincing, logical, scholarly. Let us keep our minds open until the affirmative facts are in.

I have to be very careful in introducing the affirmative speaker. I think already Dr. Durant suspects a little collusion between the Chairman and the next speaker. May I say this about him, that he is the world's greatest student of law, and if I may say it in one way, that he is the world's most terrible speaker—terrible, that is, to the man who has to answer him. Mr. Clarence Darrow. (Applause).

Mr. Clarence Darrow: I am sorry the Chairman couldn't make this reply instead of me. He knows a good deal more about the subject than I do or than both of us do. (Laughter).

My friend over here has been talking for forty minutes telling us what life is not, but not uttering a single word as to what it is. He has in the last analysis quoted Walt Whitman as the champion scientist of the world. Now, I read Walt Whitman when I don't care to think but just want to feel, and when he says that "Holiness is life," it reminds me of Mary Baker Eddy when she said, "God is love and love is God." (Laughter). No use of having two words for the same thing. Is holiness

life? Bunk! It may sound good, but it has nothing whatever to do with this subject.

Also Whitman says, "I am a groping of Deity." Well, perhaps it would have been in order, if he believes it, to tell us what he means by Deity. If one seriously does not believe that man is a machine, then it is up to him as a matter of fairness to tell us what man is—if he can—which he can't. I will be honest with you in this matter. I cannot prove to you that man is a machine. I cannot demonstrate to you just what process makes life. I cannot demonstrate to you as a mathematician would demonstrate a problem just what process of mechanism brings consciousness, if there be such a thing, which is very doubtful.

What I do contend is this: That the manifestation of the human machine and of living organisms is very like unto what we know as a machine, and that if we could find it all out we would probably find that everything had a mechanistic origin.

If I were on the other side, I would not be satisfied to belittle biology and say that the persecutors of the Middle Ages were wiser than modern scientists. If I did, I'd join the most medieval church in the city and I'd say goodbye to science.

Science cannot solve every problem, but it at least tries, and I think it has come very close to the solution of this old, old problem of what is man.

Now, what is a machine, first? I will not especially quarrel with my friend's definition of

a machine, for I never deal in technicalities, and I have no short cut in this question. I am here to learn. I only wish I had a chance! (Laughter.) One definition of a machine which appeals to me as pretty good is this: "An apparatus so designed that it can change one kind of energy to another for a purpose." Coal may be taken out of a mine and fed into a machine and it may produce power in the shape of steam or electricity. It was all in the coal before, but it has been transferred to something else. Nothing is lost, no forces, no power of any sort is lost, no matter is lost. It is simply changed into something else.

Is man this sort of a machine? Let's examine it. I don't know so much about the nobility and grandeur of man as my friend seemed to think perhaps he knows. I do not think that I am degrading him when I place him in the category of machines. If anybody complains it ought to be the machine!

What do we know about the human machine? We know that it takes one form of energy and transposes it into another. We know that we give it food which in the human system is broken up and the energy that results is transferred into something else. Let us look at the process that the human machine goes through in this transformation of energy and see whether it resembles any other machine, and if it doesn't, then what? Is there some mysterious thing about man which for lack of some other word, or for lack of any word that any human being can understand, we call a soul?

Does he stand out here separated from nature, and stand alone? Let us see what man does.

We feed him, or he can't live and he can't work. We place food in his mouth. What happens to it? It is digested. The energy in the food is released and goes into the body just exactly the same as the energy placed in the coal box of an engine is released and makes steam. How does it go? It is first taken care of by certain juices and is digested. It passes into the intestine. Then what happens? This digested food is power, just like the coal; it is energy. If a man is to work, if the body is to live, this energy must become a part of him. It must go to his brain, if he has any, to his feet, to every part of him. How does it get there? Man has a circulatory system made of arteries and blood-vessels. The artery at the intestine is separated by only a very small lining from the intestine. The juices of the intestine pass into the blood, some of the blood to the intestines. As it goes by these juices are absorbed; this food is absorbed; this energy is absorbed; the power is absorbed—a simple, plain obviously mechanical process.

Then what happens? These arteries and blood vessels reach every part of the body. They carry to every part of the body the strength that it needs and the power that it needs.

But the system must have oxygen just exactly the same as an engine must have oxygen for combustion. One thing is turned into another. This food is turned into starch, sugar,

and one or two other things and consumed to produce this power. The blood is pumped by the heart. We call it pumped; that isn't exactly the process. I don't need to describe the process—in fact, I can't. But for all conveniences everybody calls the heart a pump. Anyhow, by its constant action it pushes the blood out and in. It is carried to the lungs. As it passes through the lungs just for a brief second it comes in contact with the air, which is necessary to complete the fuel. The power is carried to every part of the human body; perfectly mechanical, like an engine, like a machine that a man has built—the whole process the same.

Scientists have made investigations upon this subject and no scientist claims that he has found the ultimate facts. Perhaps he never will, but he has found enough to justify the conclusion that man more nearly resembles a machine than he resembles a ghost carrying around a body for a time, much more nearly than he resembles something that no scientist even dares to talk about, because when he talks about it he can no longer be a scientist.

Mr. Durant talks about this reaction against religion. What does he mean by religion? Does he mean that the Lord took a perfectly good rib out of a man to make a woman? Is that what he means by religion? Has he given us one single conception of what he thinks man is? Is it more reasonable to suppose that man has come as everything else has come, that he is built upon the same pattern that everything else is built upon, that he is a ma-

chine who must take in new fuel to be transferred into power, that sooner or later the works run down and he dies just like any other machine? Now, if he isn't that, what is he?

Let's see what happens to man. Well, you take a man who loses a large part of his blood. You can put salt water in the place of it and the pump goes along until he recovers and begins making blood again. His leg, his arm, his finger are levers operating just like any other levers, built upon the same plan, all of it mechanistic. There is not a single thing upon which you can lay your hand excepting this "spirit" which is the same as the "infinite." I guess it is. I don't know what either word means. They are words that scientists do not use, although they may think there may be something in them, but they are not scientific terms, at least.

Is there anything that a man presents in his conduct, in his actions, in the uses of his abilities, that isn't performed in exactly the same way as a machine? I think there is not.

Now, let's see how far my friend has to go to say that man is not a machine. Why not? Because I can't explain and because no man can explain every process? That hasn't much to do with it. It might be more satisfactory if you could. But men have been working upon that problem, and they have gotten much further along than they were a few years ago, and they are getting further along every day.

I don't say I am sure that there is nothing

in man but a mechanism in the same sense that I am sure that two and two make four. There are very few things in the world of which I am as sure as that, and I am not sure of that. It would depend upon what the two things and the other two things were, perhaps, before I'd be sure they would make four. Two philosophers and two religionists wouldn't make four anything. They'd make two philosophers and two religionists. That's all.

I am not sure of it to a mathematical demonstration. But I am fairly sure of enough things which to me warrant the inference that when the story is all told, if it ever is told, this will be the conclusion. And I am fairly sure that no fact has so far been discovered that proves anything else.

My friend talks about the absurdity of a machine writing poetry. Well now, I think that is just what machines do, as a rule. Nothing but a machine can turn out the metrical stuff that passes as poetry.

But I was talking about man. If man is a machine, or if he is a superhuman, whatever that is, if he is a part of the infinite, so is a fly. Can you explain a fly any better than a man? We can't explain him quite as well as we can man, because we don't understand his way of buzzing, that's all! (Laughter) But flies beget, which isn't the only sign of spirituality, whatever that may be.

I might call my friend's attention to the fact that life existed before it was produced as it is today, and it may exist after it is produced

in some other way. Begetting is only one method that nature has taken for passing to a certain stage. That is all. But it isn't universal, never was, and perhaps it never will be. I don't want to discourage my friend, but it probably never will be universal. That is only one method.

Now, the fly doesn't belong with the machine. The fly has free will. It knows what it wants when it flies into the butter. It has what my friend calls free will, just as much as he has, just as much as I have, just as much as anybody has. It is governed by exactly the same laws.

If we were standing somewhere out in space and saw this planet moving as if it was in a devil of a hurry to get along with its journey, we'd say it had free will and knew where it was going. Of course, we'd say it, because we don't know any better, and somebody standing out somewhere and watching all the automobiles come into New York in the morning and go out at night would say the drivers have free will, too. They have neither freedom nor will, or they wouldn't do it. (Laughter.)

But has the fly free will? My friend says so. He talks about some of these animals that after long trial and error, bumping up against something, will find food. They don't all find it. Some of them die. And those who do find the way are preserved.

Let's see about an animal. Let's take a little animal, the plant louse. I use that for two reasons, first because I know something about

the investigation and secondly, I want to get something as close to man as I can. They catch these little fellows in a test tube, and they let a little ray of light shine on one end of the tube, and what happens? They immediately all start for that end of the tube. Why? Free will? They want to get where they can look out? Oh, no, nothing doing. They turn the tube a little, and they all run over each other to get to the other end of the tube because there is light there at that end. You see? The bugs (I don't mean humans, I mean the other bugs) hang around the electric light on a hot summer evening. What do they come there for? Of their own free will, to get scorched? Oh, no. They come there because of the effect of light upon their organism. It is a simple tropism, like hitting someone with a hammer. They are compelled to go there. They are brought there by the action of the light upon their structure; nothing else.

Does it help this situation any to say that everything that is self-perpetuating has a soul or is one with God, or two with God or whatever it might be? You must include, then, every animal—more than that, every plant is made the same way. Might the plant not say, "I am green; I am one with God. I am a creator. I take 'inorganic' matter and make 'organic' matter out of it. I have a soul." These silly scientists who are sillier than any religionists ever were, say, "I am a machine, but I am one with God." The plant can reach down into the earth and the rocks and send a root out into the moist ground and bring it

all together and make a plant. And some of us higher organisms can eat the plant so that we can write poetry.

All of these plants and all of these animals have the same basis of life as man. My friend says that a human being can grow, and a machine can't grow. A mechanistic organism can grow. Every plant grows; all animal life grows and decays. It is born and it dies. It lives its time and goes on its way. Now, what is the difference? If a man is made differently from a machine, then a tree is. A tree is a collection of cells, always growing, always dying. Man is the same; other animals are the same. Probably the cell is the furthest down you can get to the foundation of life, so far. Life probably comes from protoplasm. But that isn't saying much. It was once supposed to be saying a great deal. It is only a statement of the substance that it comes from. There is no mystery in it. Take any one of us and have us analyzed by the chemist. If you want it done, why you can have it done. You can find out everything that is in you excepting your oneness with God. You will have to go to the theologian for that.

When it comes to man you can find out every single thing that is in him. There isn't a single thing in him you can't buy at the drug store for about ninety-five cents, and a good many of them aren't worth it at that! (Laughter.) Why is it, pray tell me, that all the investigation, with closed eyes, that theologians have always given these problems, with all the thought and all the speculation, down through

all the ages they have never found a single thing that isn't mechanical, never found a single thing in man, or the manifestation of a single thing, that isn't a mechanism? And when we get to man and understand him, we understand what the mechanism is. It is man's body.

Of course, man is a little more complex organism than an amoeba, which has one cell. But there isn't so much difference at that. A man is a combination of cells like everything else. A man has more cells. An amoeba has one cell. Man is a little more complex than the early organism. We talk about the man who writes a poem. Why, they didn't begin by writing poems. Man began even lower than that! (Laughter.) He began by picking up worms and bugs and eating them—and enjoyed it. He began way down with a different form, different organs, came through almost every form, even the simplest, up to his present estate. I don't know what that is. People that have any estate always brag about it. That means that he has got more nerves to bother him, and there are more ways that he can die. But he began simpler than he is today. Not even as a writer of poetry, an organism that reached around to avoid pain and seek pleasure, looked for the sun just like the plant louse, looked for light the same as the potato, having some emotions which are in a rude way life-sustaining probably, the emotion for food and the emotion to keep his fool species going along.

His body isn't a perfect thing in any way.

It is full of mal-adjustments. No two bodies are equally good, but no two are perfect. Even his eyes are a botched job. His nervous system is a bad job. His whole internal organism is bad. At that, it is better than most machines, perhaps than any. But why? Why is it bad? I will tell you why. Let me give you a few simple illustrations. Men get varicose veins in their legs. Why? Because the small veins in the legs won't hold up all the blood of the body and they were made as they are when he walked on all fours. The veins didn't need to hold up any such weight of blood. His whole apparatus goes back to a primitive time and more simple arrangement. He used what he could use of the old while he was getting the new. How long has he been doing this? Nobody knows. As a human being he has been here at least a half million years. As a descendant of earlier organisms he has been here since the earth was cool enough for life to exist. He is constantly changing.

Is there anybody who can tell us where the first form of life began, or how it began? If he can, he ought to. It would be very interesting. Can you tell when or where or how? Nobody knows. They don't know when or where or how, but they do know this. We read it in the rocks, we read it in man; we read it in all animal life that this first was an inorganic world floating in space, made for nobody so far as we can see, unless someone was playing football with it, and it was hardly large enough for that, or interesting

enough. It circulated in space for millions of ages without any form of what we call life, and gradually, as it cooled, and probably through heat and moisture, vegetable life appeared. Vegetable life had the field alone for ages. Vegetable life created inorganic matter into organic matter. How? Because it had a soul? Nobody knows anything about the soul of a cabbage, although they think they know about the soul of a cabbagehead! I can't see any difference. Nobody knows a thing about it. Animals came, and they lived upon vegetable life, more primitive forms first. Man is the last and perhaps the most complex of all. We know enough about the past, we know enough about evolution, we know enough about man himself, we know enough about the mechanical constructions of things to be warranted in believing that when we have all the facts and are wise enough we will find that all is of one pattern. (Applause.)

NEGATIVE REFUTATION

Dr. Will Durant

CHAIRMAN WATSON: The amenities are all over, the compliments are all passed, and the fur will now begin to fly. We will now have fifteen minutes refutation by Dr. Will Durant. (Applause.)

DR. WILL DURANT: I don't like the rather harsh things that my dear enemy said about me in the beginning of his address. They hurt me a little (because I am not entirely a machine), but I shall try to forget them. I didn't know that I had said nothing, and if that is true, it is utterly absurd for me to try again. I resent, too, the effort to drag religion into the debate and to compel me to defend things which are not at issue! (Applause.) I said nothing about religion except perhaps in that little poetical flight at the end, which I presume even a machine would understand was meant as poetry. And I thought that I had put as much science into that first talk as could be digested in forty minutes.

I am astounded to learn also, that my task tonight is not merely to show that man is not a machine, but to show various other things. The gentleman expects me tonight to solve problems that no philosopher has ever been able to solve, and he seems to assume that unless I can answer to his satisfaction and to everybody's satisfaction the old problems as

to what is life, what is man, and what is mind, I have not done my task. That is a ridiculous demand upon me. I came here tonight to try to show the absurdity of a certain theory. I submit that that is absolutely all that I am required to do. I refuse to give Mr. Darrow more than he deserves for one evening! (Applause.) Some other time.

If a man comes to me and says that two times three are nine, when I prove to him that he is wrong, it has nothing to do at all with the question as to whether I can say what two times three are. I may be able to demonstrate that his answer is incorrect. If I can show that the mechanical theory of life runs counter to evident facts, it is absolutely all I have to do tonight. Probably I could do more, but not just now.

Mr. Darrow tells me that no fact has been discovered that proves anything except that all life is mechanical. Well, I can only believe that he had a good nap while I was talking. I thought I had loaded the atmosphere down with facts about locomotion and digestion and growth and almost everything conceivable. I observed the care with which he avoided touching upon the facts that I had enumerated! (Applause.)

I don't remember his attempting to meet any one of the points made, but I have hopes that an attempt will be made before the night is over. He says with the audacity of a young student that we have never found a single thing that isn't a mechanism. Well, of course,

that is the begging of a question. We are discussing that question, we are not assuming it. He tells us there is not a single thing in you that cannot be bought in a drug store. I don't think you could buy the raw materials that would make a Clarence Darrow unless you had some life potency to work upon those materials and build them up! (Applause.)

He tells me that a machine is something that transforms energy—yes, when you guide it, when you feed it, when a living being helps it, and even in that famous furnace of his that he talked about, the coal is put in by a human hand, and the coal itself was a living thing, and the wood that you put in is a living thing! (Applause.)

This childish comparison of the body to a machine is useful in textbooks of physiology where we have to introduce the young student to the superficial phenomena of a tremendously complicated situation. But to presume that that is anything more than a little helpful analogy is a youthful presumption. Would this circulatory mechanism, this respiratory mechanism, work without the vitality in the heart, and in the living tissues of that body? Take that vitality away, take that heart away, and then put all your oxygen in and all your hydrogen in, and all the materials that you wish. What happens to them? Are they built up into life? Not at all. The comparison with a machine is worthless! (Applause.) Of course, Mr. Darrow never thought of that! (Laughter.)

He tells me, with that same blithe assumption of the question under discussion: "A mechanistic organism can grow." What an absurdity! The whole question in discussion is whether it is possible for a mechanism to be an organism or for an organism to be a mechanism. That is the thing we are discussing. For a man to assume that there is anything, any such thing in the world as a mechanistic organism, when that is the thing he has to prove, is delightful; it is even more close to poetry than any effort of mine! (Laughter.)

I was interested to learn about this gentleman that Mr. Darrow spoke of who lost some blood and who was given salt water into his veins. Mr. Darrow gave himself away when he said that after a while the man began to make blood for himself again. That is a queer thing to do, isn't it? The living organism does it through that living power in it, which is there, which lies under your nose, though you may not be able to give a chemical analysis of it. That is the trouble, you see, with Mr. Darrow. He thinks that because I can't give him a physical and chemical explanation of what this living vitality in me is, that therefore it doesn't exist, or therefore it is mechanical. If we can't explain it in mechanical terms, therefore, it is mechanical. Do you see the argument? (Applause.)

Why, I submit that the merest sensation going on in these living organisms here tonight is something that Mr. Darrow has not begun to reduce to a mechanical process. A machine doesn't repair itself that way, never could pos-

sibly begin to create blood in itself. Always that power of life is there in a living thing, which distinguishes it from mechanisms.

I sometimes suspect that all the mechanisms in the world, not only those that we make, but all the things that we think are mechanical, are simply the superficial relic of what once was life. I feel that when life passes away, or takes some other form, it leaves these excretions, so to speak, of mechanism behind, as some day this exuberant vitality of mine will no doubt be gone from the bones that hold it together now, and in my grave there will be mechanical processes—perhaps. So it may be that all the mechanisms that we see are the left-behind remnants of life that has passed on. That is just a suggestion that would have to be considered at great length to amount to anything.

Now, when I speak of this power of life, it is in that sense that I consider myself free. I do not say I have free will. I submit that I never used that phrase, except to ridicule it in my first address. I quite recognize that my will is the sum total of my desires, my aptitude, my dispositions, my tendencies. I recognize that I was subjected to thousands of molding forces even before I was born. But there is that thing, that quota, that iota, that particle of life that is subjected to these things. It is a neglected part of the determining conditions. That is the whole point. It is not merely a passive wax upon which experience writes. Surely Dr. Watson will bear me out when I say that this view of mind is simply a passive

thing upon which sensations work their will unresisted, that it is very antiquated psychology.

We even select what our sensations will be. There are thousands of audible things which you do not hear at this moment because it is not to your purpose to hear them. You select what you shall hear, what you shall see (within limits, of course). The mind is a selective and reacting thing. It is a molding thing.

Mr. Darrow, of course, is still living in the age of Herbert Spencer: his philosophy and science have not, perhaps, come down from that mid-Victorian age. He would think as Spencer did of the mind as simply a readjustment to external things, of education as an adjustment of the individual to the environment.

We understand today that the mind is not only adjusted to its environment, but it adjusts the environment to itself. It molds and creates. We understand that education does not or should not merely fit the individual for his environment. It should fit him to fit his environment to his own will and purposes and desires. Only in a non-mechanical philosophy could you conceive such an education. I am determined, I am compelled, I am molded, but there is something in me that struggles, that has some inexplicable but visible and actual energy. Now that must be considered. It is the most immediately known thing in the world, this vital force that exists in our human behavior, this consciousness.

I am told that there is no consciousness.

In one minute can I show you that there is? Consciousness is the theater of imagined responses, enabling us to select which of the imagined responses we perceive will be the most successful. Here is a situation, a problem for me to face. A purely mechanical organism would react at once; why should it hesitate? I say to myself, "Now, I could do this." I imagine what would happen if I did this. I see in imagination that that result would be unpleasant. I do not do that. I imagine another possibility. I rehearse, so to speak, various possible responses. That is the function, the efficacy, the meaning of consciousness. And then I choose; and in the degree in which I have knowledge of my many possible responses, in the degree in which my knowledge enables me to perceive and understand that variety of possible reactions, that which in my foresight seems most beneficial to me. I act then, for all the world, unlike a machine. That is the meaning of consciousness in this world.

AFFIRMATIVE REFUTATION

Clarence Darrow

CHAIRMAN WATSON: Mr. Darrow now has twenty minutes in refutation. (Applause.)

MR. CLARENCE DARROW: I am really sorry if I said anything that was at all rough to my friend. Perhaps I did. There are few people, few men whom I have ever known for whom I have a higher regard and a greater appreciation. I'd rather have written his book on philosophy than to have done anything or everything that I ever did. (Applause.) And I only wish he was as philosophical in his debate as he is in his book! (Laughter.)

Now, let me see. I told you that you could buy everything in a man in a drug store for about ninety cents if you want to fool away your money. You can't. We don't know how to do that, perhaps never will know. But we do know that every man acts as a mechanism, or I think we know it. He says my illustration of the blood and the action of the heart and all that was primary stuff. I wish it were primary stuff. But he says you couldn't make all this act without the heart. Oh, yes, you can. Life existed for ages without anything that resembles a heart. Why, it is a growth, it comes from circumstances that surround it. It wasn't here forever. It grew up as the machine changed and as it may change. Perhaps it will grow again in some other way.

We used to say that nobody's brain could be injured without death following. We know better now. We know the brain is about the mushiest part of the human organism. You can take away the most of it and get along all right. (Laughter.) I don't mean all right, but just as well as you do now. In some of the animals it has been taken out entirely, and they got along all right. And of course from all we know of man we know he does just the same thing without a brain as he does with it. There isn't any difference.

There isn't a thing in man that I can think of at the moment that hasn't existed in various forms or that he hasn't lived without, and if he lives long enough in this world of ours, this man that we see today will probably be entirely changed, whether for better or worse we don't know. I imagine it couldn't be for worse, so it will have to be better.

The strange thing is that in a religious sort of way we assume that everything was made as it is today. My friend says I ought not to have brought in religion. I again say I didn't bring it in. He brought it in. But why not bring it in? It is there. Let me say this: The conception that has been taken tonight, which is generally taken, is a religious conception. (Applause.) It is not a scientific conception, and it has no relation to science. (Applause.)

I want to repeat again that I can't explain the mystery of life, but I think I know enough about it to believe that when it is all told, human life and animal life and plant life will be just like everything else that exists, and all

come within the same great general realm of law, that no miracle was wrought when these things made a human being. Man wasn't made out of the earth in the image of God, with a bone furnished to make a wife. Nothing of that. He is a matter of evolution from the first forms, and where those come from I don't know, but I do believe that it all works in a mechanistic way. (Applause.)

Suppose one of you is afflicted with disease and you go to a wise doctor. What does he do? Ask you about your soul? He does if you go to a Christian Scientist, but I am speaking of a wise doctor. He doesn't say a word about it except perhaps tell you to be cheerful so your food will digest. He examines you. He tries to find the cause of your malady. If he finds it, what is it? In every single instance it is a mechanistic cause, every one, and no doctor ever finds a cause until he finds a mechanistic cause. (Applause.) Until that time he goes at your case blindly, giving you such medicines as he happens to stumble on, and sends you the bill, but he knows nothing about the disease, nothing whatever. Every solution that is made of man's conduct, every single solution that is made is a mechanistic solution, and all that we can correlate in the conduct of a man confirms the machine which converts one form of power into another form of power.

Let's see how serious it would be if I am not right in this. My friend says I have no business to ask him the question where life came from. That is a lawyer's answer. (Laugh-

ter.) You know lawyers. I have the affirmative of this case. It is enough for him to stand off and parry my blows, if any, and not let me land on him, and keep my mouth shut as to everything else. That is enough. If he could do that he'd do well. But one way to prove that my theory is wrong would be to tell us where life did come from, wouldn't it? Some of you shake your heads. That is because you are religionists. (Laughter.) You don't want to contemplate giving up your soul. You can't get rid of the idea. Your own egotism makes you believe that you are so great that some Supreme Being designated you for immortality, and you are going to live forever! (Applause.)

Now, if one did not believe in the mechanistic theory of life, he probably would believe in some other thing. Why not tell us? Why haven't we heard one single word? Why do we say, why do we hear only the statement that you don't account for life? You don't account for this, you don't account for that, and still as to anything we believe we are silent excepting to recite poetry, which isn't very good poetry at that! (Laughter.)

I think that the theory of mechanism is growing very rapidly in the world. There are only two theories that I can conceive. There may be a hundred others that no man knows about, but there are only two theories that can be conceived. Now my friend talks about vitalism. What in the dickens does he mean by vitalism? Change the word spirit to vital, and

it means nothing. There are only two theories that way back in the infinite past there happened to be matter in this universe. Now, don't any of you get too much proud flesh, as Rev. Field called it. Your soul was made by people who thought the earth was flat and the stars were right close by and about as big around as a dime. Your ideas came from that, and by people who thought that the stars were placed in the heavens for human beings to look at, nothing else. A human being was so great and so wonderful and so magnificent that everything on the earth was given into his keeping, and he alone in all the universe was endowed with an immortal soul. Now, if you want to believe it, and can, why do it. You will never get over it unless you take something for it! (Laughter.)

We know now that the earth is one of the most insignificant spots of mud in the whole untraversed universe; that there are an infinite number of suns and planets and stars that are as much bigger than the earth as we are bigger than a fly speck. We know it, and yet, we hang on to the idea that somehow or other we are going to be cheated unless we live forever!

I am not here to give you any consolation. I am not going to give you any consolation excepting this, that in a world of egotistic people who have nothing to brag about excepting their ignorance, a frame that is capable of some joy but of much pain, a life of vicissitudes whose end is death and pain, and whose constant ac-

companionment is pain, in a world of that sort it ought to be some consolation to know that you haven't got to live forever.

Why am I interested in this subject, and why should you be interested? Because, as my friend puts it, man is an inquiring animal. Can any being something like man be an inquiring animal? Oh, yes. All the animals are, and I suspect in the same sense all the plants are. You see them poking their noses into the most unheard of places, and for no reason on earth excepting curiosity as far as I can see. We can't correctly translate the actions of plants and animals. The only thing I ever saw that to my limited knowledge seemed to have free will was an electric pump I had once on a summer vacation. Every time we wanted it to go, it stopped. I couldn't think of anything except free will, and all of a sudden when we knew nothing about it, it started again? (Laughter.) Now, I suspect that there was a reason for it. I suspect there was just as much reason for it as there is for the most intelligent being, if we could find such a person, and such an action.

I think I know this—that not a thought can pass through your minds without wasting tissue. Of course, people don't waste much tissue! (Laughter) I know that. Not an emotion can move you without its cost in tissue. You can weigh the waste in tissue caused by the life and the thought of a man confined in a glass cage. You can weigh it just as you can weigh what is spent and used by a steam engine in producing steam. The law of conservation and

correlation of forces which so far seems to be supreme means that no force is lost, but that it all passes into something else, and that no force whether physical or what this moronistic world calls intellectual (moronistic was the word I used), can come without being fed, without the power and the force that it takes from your body in some form.

As far as we know and can see and understand, this is a monistic universe. It is all of one piece. The farthest star that our telescope sees is made from exactly the same material as the earth. One law rules, and it rules the living and the dead. There are no living, and there are no dead, because there is action in the dead as well as the living, simply of a different form as the decay of the body and sending forth of the gases is all one thing, and it is idle to try to separate it. (Applause.)

NEGATIVE REBUTTAL

Dr. Will Durant

CHAIRMAN WATSON: Dr. Will Durant will now close the debate with a five minute rebuttal.

DR. WILL DURANT: I doubt if the first speaker in a debate has any right to this third appearance. I have protested against it, but they have asked me to obey the Queensbury Rules, and so I should like to say (now that Mr. Darrow has no chance of answering me) that all his talk about the immortality or non-immortality of the soul is irrelevant to this debate, and I put it aside. (Applause.)

He tells me that mine is a religious conception, and that it is not a scientific conception. Words do not frighten me. What he really means, though, if he understood himself and the terms that he uses, is that my conception is not a physical conception. He supposes that the only science is physics. I wonder has he studied biology and seen the vitality of it? My conception is a biological conception, and not a physical conception, and the assumption that a conception is not scientific unless it is physical is the assumption that it is supposed to be proved tonight, and not to be taken for granted continually. Life, not a machine, is the clue to understanding the world. That

is the conception that I have given. If that is of any use to religion, very well. It is welcome to it. Anybody is welcome to that because I have simply arrived at it in an honest search for the truth, and I don't care where it leads.

He tells me that all medical causes are mechanistic. Nonsense. Has he ever heard of the germ theory of medicine? Why, the whole science of medicine today is built on Pasteur's conception that practically all diseases are caused by live organisms! (Applause.)

Let us be honest and clear-headed with ourselves. Do we treat ourselves as machines? Do we treat our friends as machines. Does Clarence Darrow treat people as machines, or as living, growing, groping, feeling personalities? I leave his life to answer that.

He tells me that life is stupid, that it is often suicidal. The insect comes toward the light. Yes, life is not infallible. It is full of errors, but that is just the point. If it is full of trials, it struggles around and through these stupidities; it dies. Even the lowest behavior is not as Mr. Darrow thinks. Let him read the latest report on the investigation of the behavior of the protozoa.

Yes, life is full of mal-adjustments, of sufferings, but what I see in it is that it ran a tremendous gamut from the amoeba to Clarence Darrow, and I do not believe that we can understand that effortful struggle of life to reach from that lowly condition to this culminating condition unless you see in it something that

could not possibly be explained in mechanical terms. And when I say vital I do not use a mystical term. Let me remind you that we are more directly aware of vitality than of any other fact in the world. If that is not a fact, nothing is. And yet, we die, which I remind you again a machine cannot do. But sometimes before we die we reproduce, and through reproduction life cheats death and passes on. We individuals are the cells of the body of life; we drop off like the epidermal cells of our hands, but the living power goes on, reaching ever higher.

Mr. Darrow wants my theory. My theory is not vitalism. I never used the word tonight, but he has chosen to put that theory into my mouth. Vitalism is the theory of Bergson, that in addition to matter and absolutely distinct from it is this thing called life which he believes can exist without matter. I disagree with all those propositions. I do not say that life exists in matter and distinct from it. I say matter is alive. I say that life and matter are one in inextricable unity, and matter is a word that describes only one side of that complicated and throbbing fact. (Applause.) I suspect that if we could get into the inside of the matter, we should have to use in order to understand it that concept of the organism and vitality which I have suggested to you. That is all,

LUTHER BURBANK

Luther Burbank, naturalist, originator of new fruits, flowers, etc., was born in Massachusetts in 1849. He was always devoted to nature study, especially plant life, with which he early began to experiment. He moved to Santa Rosa, California, in 1875, where he conducted Burbank's Experiment Farms. He often had several thousand distinct experiments under way—even at the time of his death growing some five thousand distinct botanical specimens from all over the world. He was also a special lecturer on evolution at Leland Stanford, Jr., University. His fame as a botanist and inventor of new plant forms awakened widespread interest in plant breeding throughout the world.

In January, 1926, Luther Burbank made a declaration of agnosticism to a newspaper reporter. Although Burbank's rationalistic convictions were not by any means unknown to readers of his books, or to his friends, the publication of this interview in the newspapers created a furore of criticism throughout the country. Since it then became known generally to the public at large, the facts about Luther Burbank's agnosticism were news. In spite of criticism from the pulpits, he refused to qualify his unequivocal statements. "I am an infidel," he said.

About the middle of March Luther Burbank became ill with gastro-intestinal complications. He died April 11, 1926. Lest the "last words" of this infidel be garbled in future ages to de-

lude credulous mankind, it should be emphatically stated that Luther Burbank did not recant—even the newspaper accounts of his death made this fact clear. He remained an infidel until the last—an unbeliever, scientifically sure of himself, passing from life into darkness.

WHY I AM AN INFIDEL

Science is knowledge arranged and classified according to truth, facts and the general laws of nature. Our Dr. David Starr Jordan defines it more briefly as "organized human knowledge" or "human experience tested and set in order."

There are always at least two sides of every question which may be suggested to the human mind. Sometimes both views are correct, but far more often one is right, and according to facts and truth, the other wrong. All personal, social, moral and national success depends upon the judicious wisdom of our choices made by the aid of science. Narrow personal prejudices and feelings quite too often becloud the issue and ultimate defeat is the inevitable result.

Life as we see it around us on this planet is usually thought to be confined to man, animals and plants, those organisms which grow and reproduce their kind with more or less precision. Why should we omit crystals which grow as truly as plants and reproduce themselves quite as precisely to type, or the more primitive forms of life which are reproduced by division? Science is proving that the world is not half dead, but that every atom is all life and motion.

Life is self-expression, intricate organized polarity. The lure of happiness and the fear of pain are fundamental qualities possessed by all living things and are the two forces which have through untold millenniums kept what

we usually call life from destruction by the ever encroaching outside forces of destruction. Life is heredity plus environment. At birth of a plant, animal or man, heredity has already been fixed. Environment may now call into action only those tendencies which have been experienced in the age long past, yet may recombine and intensify them in a most surprising way. Such a modification is limited, generally, to the individual, but may, if repeated generation after generation, by slow increments at last become fixed and available in the species.

Assimilation and reproduction are, and, of course, must be fundamental and universal. The power of adaptation to various conditions which beset all life may also be considered as fundamental for the continuation of any species. All these various powers of adaptation have to be acquired individually and repeated indefinitely until so fixed in the life stream that they are reproduced. *Repetition* is the means of impressing any quality or character in animal life or in man and by just the same means plants are impressed, and their qualities and habits changed as we desire. All life depends upon a series of selections and repetitions.

The first faint glimmerings of choice may be seen in the polarity of the magnet, next we see it perhaps in plants and the more primitive forms of life, and as we mount higher and higher in the scale of life there is more and more freedom of choice and less dependence upon heredity.

Ancient tribes and nations had many gods, often one for almost every phenomenon of nature. The Hebrews have the credit of inventing the conception of our monotheistic Jewish-Christian God, who however is represented as having most of the weaknesses and bad habits of primitive man; this was a step in the path of evolution toward man's present conception of God; the God within us is the only available God we know and the clear light of science teaches us that we must be our own saviors, if we are to be found worth saving; in other words, to depend upon the "kingdom within." The manhood and womanhood which would make the most of life in *service* to others is a sublimated form of the best of self which leads the way to a long lifetime of usefulness, happiness, health and peace.

There are without doubt some human beings in every nation, who, according to our present standards of civilization are truly civilized, but grave doubts may be entertained as to any community or any nation who could in any way measure up even to this standard scale of life, where we find more and more *freedom*, but even man today is far from free. Slaves yet to war, crime and ignorance—the only "unpardonable sin." Slaves to unnumbered ancient "taboos," superstitions, prejudices and fallacies, which one by one are slowly but surely weakening under the clear light of the morning of science; the savior of mankind. Science which has opened our eyes to the vastness of the universe and given us light, truth and freedom from fear where once was darkness, ignorance

and superstition. There is no personal salvation, there is no national salvation, except through science. There are too few who exploit the inexhaustible forces of nature and far too many who exploit their fellow beings. Useless waste and unnecessary parasitism take at least nine-tenths of the productive capacity of the United States.

Will the growing intelligence of man (Science) forever tolerate the wholesale production of the ever-increasing proportion of idiots, morons, Mongoloids, insane, criminal, weak, destitute, nervous, diseased half men and women who infest the earth to their own sorrow and disgrace and perhaps the ultimate destruction of our present state of civilization? A knowledge of the fundamental laws of nature, not inefficient palliatives, is the *first* step. Is there a problem equal to the building of a better humanity? Our lives as we live them are passed on to others, whether in physical or mental forms tinging all future lives forever. This should be enough for one who lives for truth and service to his fellow passengers on the way. No avenging Jewish God, no satanic Devil, no fiery hell is of any interest to him. The scientist is a lover of truth for the very love of truth itself, wherever it may lead. Every normal human being has ideals, one or many, to look up to, reach up to, to grow up to. Religion refers to the sentiments and feelings; science refers to the demonstrated everyday laws of Nature. Feelings are all right, if one does not get drunk on them. Prayer may be elevating if combined

with works, and they who labor with head, hands or feet have faith and are generally quite sure of an immediate and favorable reply.

Those who take refuge behind theological barbed wire fences, quite often wish they could have more freedom of thought, but fear the change to the great ocean of scientific truth as they would a cold bath plunge.

Mr. Bryan was an honored personal friend of mine, yet this need not prevent the observation that the skull with which Nature endowed him visibly approached the Neanderthal type. Feelings and the use of gesticulations and words are more according to the nature of this type than investigation and reflection.

Those who would legislate against the teaching of evolution should also legislate against gravity, electricity and the unreasonable velocity of light, and also should introduce a clause to prevent the use of the telescope, the microscope and the spectroscope or any other instrument of precision which may in the future be invented, constructed or used for the discovery of truth.

LUTHER BURBANK, INFIDEL

By Edgar Waite

I

When Luther Burbank, disciple, prophet and high priest of nature, announced himself as an infidel he loosed a shot in the hierarchy of orthodox thinking that was destined, like another shot before it, to be heard around the world.

On the morning of Friday, January 22, 1926, before Burbank's avowal of disbelief was broadcast through the press, California's gentle patriarch went about his experimental labors with the serenity of one who knows that he has harbored no evil thoughts of his fellowman and that in seventy-seven years of life he has never consciously hurt a living being.

He was the revered, kindly old gentleman of an admiring world. No voice had ever been raised against him. How could any voice be raised against a man who had done only good, who had filled the world's gardens with more beautiful flowers than they had ever known before, who in times of hunger and war had helped replenish the world's granaries by his genius, and who had given mankind meaty vegetables and gorgeous fruits such as nature, working blindly, had never before visioned?

At noon of that day the *San Francisco Bulletin*, shielding its sensational "beat" against the buccaneering plagiarisms of rival papers, rent wide its pages to make space for my copyright interview in which the famous horticulturist described himself fearlessly as an infidel, expressed disbelief in immortality, and of course scornfully dismissed Henry Ford's recently pledged adherence to a fantastic theory of reincarnation.

And before night Burbank, wrested violently from his calm nature-lore in the thriving little city of Santa Rosa, became the center of the most exciting philosophical and theological discussion of our era. Letters and telegrams began pouring in, first from nearby cities, but,

as the days passed, from an ever-widening circle that finally took in Canada, England, Germany and a score of other countries. From scientists and laymen who with Tennyson believe that "there is more faith in honest doubt than in half the creeds," came messages of commendation. From the orthodox clergy, and from cranks of all conditions of mental servitude, there came an avalanche of expostulation, reproof, and sibilant recrimination for the man who had had the temerity to tell what he thought in the face of established doctrine.

Ministers in Luther Burbank's own town, whose churches he had attended at times and for whose congregations he had more than once spoken on scientific subjects, winced, looked first askance, then scandalized. With wry faces religious leaders pecked at his words, outraged orators enveloped him in the gases of withering, trenchant criticism, and fanatics lashed him with biblical platitudes. Like kernels of popcorn, livid defenders of the faith, scorched by the heat of what a great man sees as Truth, jumped high into the air, and with quavering voices went into convulsions. Sententious champions of the gospel squared off to engage Burbank in Quixotic jousting, and fanatics ran amuck with anonymous threats of every dire punishment known either to God or the evil eye. One writer, addressing his protest to the newspaper that had first interviewed Burbank on the subject, consigned the plant wizard to no less a tropical climate than hell itself, where it was promised he would meet Conan Doyle and Sir Oliver Lodge.

And for many days thereafter, the furore, drawing fuel into the vortex with tentacles that encircled the earth, continued unabated. Rather was it marked with increased intensity, for many things were happening after that first interview was published.

But through all the fury and the flailing of a fetid atmosphere Burbank himself remained unperturbed. The Women's Christian Temperance Union in Santa Rosa, of which he was an honorary life member, held a meeting of prayer (which only ten women attended!) for the misguided scientist—a meeting that became not so much a time of prayer as an indignation council—yet Burbank refused either to have his soul saved or to recant. They could pillory him for the leering stares of a morbid public. They could burn him, figuratively, at the stake. They could unroll eternal thunder to peal out threats of everlasting damnation, but Burbank remained inflexible on his original platform.

From the outset the storm that blew so suddenly to rattle the holy eucharist became a battle of the dictionary.

Burbank had said he was an infidel. Self-constituted apologists, as represented by the newspapers that had missed the story and by zealous ecclesiastics, insisted at once that Burbank had been misunderstood, that he had meant agnostic or something else less offensively noxious than infidel. Churchmen and newspapermen invaded Burbank's home grounds in hordes, all apparently bent on the determination to substitute a less inflammatory word.

But Burbank evidently had consulted the dictionary before employing the word "infidel" in the first place, or in any event he peeked into its confiding pages after the first storm clouds began to break.

He had found that an agnostic is one who professes ignorance as to the beginning of things and the power behind them. He had found that an atheist is one who denies the existence of God. And he had found, in *Webster's New International Dictionary* that an infidel is:

1. In respect to a given religion, one who is an unbeliever; a disbeliever; especially a non-Christian or one opposing the truth or authoritativeness of the Christian Church.
2. One who does not believe (in something understood or implied).

Thus the harried, lovable old man, met his well-wishers with unflinching eye, and was able to say: "I am an infidel. I know what an infidel is, and that's what I am."

I heard these words with keen relish, for doubtless it would have gone hard with me had Burbank squirmed out of an unpleasant situation by declaring what so many wanted him to declare—that he had been misquoted, that his sentiments had been garbled and distorted as the words and deeds of Christ himself.

II

I had been sent to Santa Rosa to quiz Burbank as to his theories on immortality and reincarnation. Burbank had that day been quoted

in a brief dispatch as disputing the theory of his old friend, Henry Ford, that we return to earth after death to live again in some other form—perhaps a maple tree or a fox terrier.

"All right," said the managing editor, "Burbank has told us what he doesn't believe. Now it's your job to have him tell us what he does believe."

Burbank answered the question first by an epigram, and he asked that the interview begin with the thought it contained.

"Most people's religion," he said, "is what they would like to believe, not what they do believe. And very few of them stop to examine its foundations."

Then, going on to tell why he does not believe in a resurrection: "The universe is not big enough to contain perpetually all the human souls and the other living beings that have been here for their short spans. A theory of personal resurrection or reincarnation of the individual is untenable when we but pause to consider the magnitude of the idea. On the contrary, I must believe that rather than the survival of all, we must look for survival only in the spirit of the good we have done in passing through. This is as feasible and credible as Henry Ford's own practice of discarding the old models of his automobile. When obsolete, an automobile is thrown in the scrap heap. Once here and gone, the human life has likewise served its purpose. If it has been a good life, it has been sufficient. There is no need for another."

The scientist, who thus took exception to theories of a man whom he had but recently described as "one of the living geniuses who can truly typify our age," then went on to his adopted principle, true in his plant world as in human life, that there is no repetition in nature.

"The theory of reincarnation," he said, "comes, like all other religious theories, from the best qualities in human nature, even if in this as in the others its adherents sometimes fail to carry out the tenets in their lives.

"Religion grows with the intelligence of man, but all religions of the past and probably all of the future will sooner or later become petrified forms instead of living helps to mankind. Until that time comes, however, if religion of any name or nature makes man more happy, comfortable, and able to live peaceably with his brothers, it is good.

"But as a scientist I cannot help feeling that all religions are on a tottering foundation. None is perfect or inspired. As for their prophets, there are as many today as ever before, only now science refuses to let them overstep the bounds of common sense.

"The idea that a good God would send people to a burning hell is utterly damnable to me. I don't want to have anything to do with such a God. But while I cannot conceive of such a God, I do recognize the existence of a great universal power—a power which we cannot even begin to comprehend and might as well not attempt to. It may be a conscious mind, or it may not. I don't know. As a scientist I should

like to know, but as a man I am not so vitally concerned.

"As for Christ—well, he has been most outrageously belied. His followers, like those of many scientists and literary men, have so garbled his words and conduct that many of them no longer apply to present life. Christ was a wonderful psychologist. He was an infidel of his day because he rebelled against the prevailing religions and government. I am a lover of Christ as a man, and his work and all things that help humanity, but nevertheless just as he was an infidel then, I am an infidel today."

There it is, the hated word buried deep in the philosophical folds of a few candid remarks to a reporter. But let us go on:

"I do not believe what has been served to me to believe. I am a doubter, a questioner, a skeptic.

"However, when it can be proved to me that there is immortality, that there is resurrection beyond the gates of death, then will I believe. Until then, no."

One might think that these words would be accepted as the reasoned thoughts of a sane man. But in this age of bigotry they were not accepted. Burbank would have been the last man concerned to object to a calm, rational refutation of his views.

Instead of any such well ordered rebuttal, those of narrow vision and intolerant hatred for free thinking sought to crucify him with stinging words.

III

So it becomes necessary for me (since I have talked with Burbank many times on many subjects) to tell more about him as a man and as a thinker in order that the hysterical clamor that rent the air may not be accepted for more than its face value.

Burbank studied life at its fountain head—in the marvelous little buds and shoots and leaves that burgeon forth each spring to fill us anew with the awe for nature. He was a naturalist, no less than Thoreau. Nature was his teacher and he recognized her as a symbolism of that mysterious power which he was willing to have called God but which suited him as well if it was called merely Force. He saw nature, with Goethe, as the living, visible garment of that same mysterious power—God or Force, and faith in nature won him the eminent place he occupied in the world.

Why, then, did he lack faith in the accepted doctrines of religion? Why did he see all religions on a tottering foundation? Because religions are based on a promise of immortality, and a threat of divine punishment for sin—two things to which this nature man could not reconcile himself.

For the hope of immortality, he believed, is the refuge of cowards, and he could appropriately quote the Bible itself in pointing out that the commonly accepted faith is merely the substance of things hoped for, the evidence of things not seen but for which puny man, striv-

ing selfishly to improve his position, to increase his goods, always reaches out a grasping hand. Voltaire pictured faith as "deferential credulity." Burbank saw that incredulity may rob us of our smug complacency, but in recompense gives us a sense of sincerity in our efforts to arrive at the truth. The philosophy of the infidel, he knew, may not be the philosophy best suited to the masses, held in subjection by a tempting promise of good things to come, but to the thinker who wishes to tear aside the veil of false promises this philosophy must, after all, be the only acceptable one.

All this having been true to Burbank, if I caught his thought correctly, the great scientist's tolerant, yet withal inflexible, attitude toward those who were disparaging and ex-coriating him is entirely understandable.

When the Women's Christian Temperance Union of Santa Rosa called its meeting to pray for Burbank, he only smiled, as much as to say that prayer at least was harmless, even if it couldn't do any good.

Burbank had been a contributor to and a member of the organization for many years because he believed in its efforts toward bringing about prohibition. But he was not in the least perturbed when the very woman who had proposed him as an honorary life member five years ago joined in the call to save his soul. This call concluded with the following paragraph:

"All mothers and women who believe that irreparable injuries have been done to the cause of religion by the utterances of Luther

Burbank, and who believe in the efficacy of prayer, are invited to join together for a season of prayer for Luther Burbank that his eyes may be opened and our youth may not be led astray from the religion of their fathers."

The meeting was not so well attended as was to be expected. Only ten women of Santa Rosa, where Burbank had developed practically all the marvels of the fruit, vegetable and grain worlds for which his name has become known throughout the nations of the globe, turned out to lift their eyes in solemn supplication that his soul might be redeemed, that he might be forgiven for his blasphemy.

But in some inexplicable manner their prayers seem to have been unanswered. For Burbank continued to smile urbanely—and he stuck to his guns.

On the other hand, Mrs. Burbank, the scientist's young wife, flashed defiance. In announcing that she and her celebrated husband had declined invitations to attend the meeting, she said of her fellow townsmen:

"It is simply an effort by the people of Main Street to get a little publicity. If these misguided, impertinent people would confine their activities to persons of their own caliber they would be much more logical and perhaps accomplish some good. It is all quite in line with the efforts frequently made to get rain by praying for it."

And then, further to complicate an already vexed situation, Burbank accepted an invitation to speak from the pulpit of the First Con-

gregational Church in San Francisco. He had been so invited some time previously by the Rev. James L. Gordon, a modernist type of minister who leans more to the sensational and to the attractions of immediate public interest than toward the old-fashioned, conservative line of church programs. Now, with the discussion of immortality, resurrection and infidelity at the boiling point throughout the country, but particularly in California because its centrally distributing element was located here, Burbank philosophically consented to address the fashionable San Francisco congregation on his beliefs in divinity and eternity.

The church, of course, was crowded to the vestibule. Hundreds stood outside hoping to get in long after the doors were closed, and then stood an hour or more longer to see the white-haired infidel come forth from the church, where he had explained simply why he could not accept many of the commonly accepted beliefs.

It was a trying situation, no doubt—both for Burbank and for Dr. Gordon—but a congregation that had assembled in the huge stone edifice, forewarned of what it would hear, did not march out in indignant protest at Burbank's sacrilege, but stayed to hear him out in respectful silence, then left, some of them perhaps with the feeling that they had enjoyed a most entertaining hour.

But even that did not close the incident, although Burbank expressed hope, not without fervor, that the matter might be allowed to drop and he be allowed to get back to his work.

Letters continued to stream in from all points of the compass—538 of them in a single day, with the temperature steadily mounting. In all this febrile rush of things, however, the scientist was not too busy to write a reassuring letter to his newspaper friend, who in the midst of the furore had sent him a solicitous note expressing hope that his story and its reaction would not forever deprive Burbank of a zest for living.

"To be sure," the scientist wrote, "I have had my hands full the last few days, as I am receiving some five hundred or more letters a day, but the publication of our interview made my life happy, not miserable."

And then, doubtless with a mischievous sparkle in his eyes, he returned with sardonic glee to the word around which the whole controversy has ranged, subjoining, "*Faithfully* yours, Luther Burbank."

IV

In the meantime, the orthodox clergy of California joined with that of other sections in soundly berating Burbank for being so courageous as to voice his views.

Said the Rev. Fred A. Keast of the First Methodist Episcopal Church in Santa Rosa, where Burbank had attended services sporadically: "Mr. Burbank, in a time when the youth of the land are jazz crazed and breaking away in large numbers from religious teachings, has voiced foolish utterances." And he went on, according to press dispatches, to score Burbank as an uneducated man,

Whereat the latter replied: "Although I went to college as a youth, I never considered it necessary to steep oneself in academic learning in order to learn how to think. I welcome a fair and square, open and above-board fight on any subject, including this, but I despise a man who sneaks around under a cloak or cover of any society or clique to strike his blows."

Said the Rev. E. E. Ingram, pastor of the First Presbyterian Church at Santa Rosa: "If words can be made to mean anything that one wants them to mean, we are bordering on linguistic anarchy. I regard Mr. Burbank's statement as most unfortunate and not worthy either of Mr. Burbank's head or heart. Mr. Burbank does not seem to know the meaning of the words and terms he used."

But Burbank merely smiled, pointing his finger suggestively toward the dictionary, and replied: "I said I am an infidel in the true sense of that word. Look it up, if you don't believe it."

In addition to these critics, others presented themselves from near and far. One suggested kindly that "the gardener should stick to his cabbages," another that "the cobbler should stick to his last."

Archbishop Edward J. Hanna of San Francisco, who was mentioned in press dispatches from Rome as a likely candidate to be elevated to the rank of cardinal, entered into a lengthy dissertation to prove that there is a God—a premise, or conclusion, as you will, that Burbank never denied. He merely said that for all of him the power called God might just as well

be called Allah, Force, or by any other name deemed fitting.

On this point he elucidated further: "I believe in a supreme ruler of the universe, no matter what name one applies to it. The chief trouble with religion has been too much dependence upon names or words. People fail to discriminate. They do not think. Generally people who think for themselves, instead of thinking according to the rules laid down by others, are considered unfaithful to the established order. In that respect I, too, differ with the established order and established designations."

Nor did Burbank stand alone in his fearless tearing away of old veils.

Dr. Ray Lyman Wilbur, president of Stanford University, had this to say: "The great accomplishment of science has been to place much of superstition in the discard. Science deals with ascertainable facts. Religion goes farther than science in that it deals with personality and persons. The great difficulties that science has had with religion have come largely from the fact that there has always been a strongly dogmatic quality in organized religion. A race grows with accumulated experience, just as does a child, and with a racial growth there come new conceptions of religion. There is evolution in religion and religious thought that is as evident as the evolutionary processes in other phases of the world."

Of the western ministers; only one, Rabbi Jacob Nieto, spoke up in partial defense of Burbank's views. "While not going so far as to

say that religion today is on a tottering foundation," he told interviewers, "I do believe that it is in a state of transition and that Tom Paine's 'age of reason' is dawning upon the world. If Mr. Burbank meant that he is an agnostic rather than an infidel I can understand his position, for neither do I believe everything that is told me. It is true that the Bible has been edited and re-edited many times, in each case to suit the spirit of its particular age and occasion, but I would not say that Christ's words have been garbled. As to immortality, let us remember the verse in Ecclesiastes: 'Then shall the dust return to the earth as it was and the spirit shall return unto God who gave it.'"

V

The battle of the dictionary, and, for that matter, the eternal battle of the ages—almost as old as the battle of the sexes—continued to ebb and flow.

Burbank, rising as ever at six o'clock and putting in a hard day's work in his experimental gardens fifty miles from San Francisco, lent a not too attentive ear to the conflict, going on serenely about his labors, his conscience clear, his mind keenly alert, but willing to wait for Death itself to show whether there is anything beyond. Burbank knew that the reason of weak men staggers before the thought of immortality, and that through appetite for it "imagination folds her weary pinions."

As for himself, let the curtains draw aside

when they might. He knew he would continue to believe that Christ was but a man, and that when we quit this life we lie down to rise no more.

Nor had he any apologies to make for his heresy. If anyone asked him, there were always the words of Carlyle:

Pin thy faith to no man's sleeve.
Hast thou not two eyes of thy own?

LUTHER BURBANK SPEAKS OUT

By Joseph McCabe

There were two Pillars of Hercules in the United States whom I wished to see. Thomas A. Edison towers on the eastern coast, but I had to rush through New York and could not stay for my friend to present me. In San Francisco I had the—for so restless a wanderer—unusually long stay of six days, when the imperious voice of E. Haldeman-Julius, vibrating over the wires, roused me from my slumbers and bade me seek the shrine of Santa Rosa. I responded with alacrity. No, that is not poetry. I rose at 7 a. m. For me that is deadly prose.

And prosy was the journey of fifty miles to see the great master of practical science. The Golden Gate was of ancient lead. The hills were sullen. A gray-blue haze screened the fair maid California. She was just recovering, maid-like, from a prolonged fit of weeping, and seemed cold even to the amorous sun, though the stately palms and rich green oranges bore witness to the warm blood pulsing in the heavy

bosom, and the soft sibilants of the Spanish names suggested saints and sinners. San Rafael, San Anselmo, and so on. We have wiped out these superstitions, of course. Now we have St. Riley and St. Straton. Well, Anselmo was at least a conscientious scholar in his time, and Rafael, if tradition be worth aught, was a comely youth. But these modern saints and sages. . . .

We are in Santa Rosa and this is the house of the man who did as much as any to impress on the world the beneficent power of science. He added billions to the wealth of the world, but this is no marble palace softly gleaming through the palms and cypresses. A very plain house, and a very pretty maid looks at me cynically through the mosquito-net door. She is used to visitors, and does not trouble to unfasten the door.

"Is Mr. Burbank in?"

"Yes, he is in," she says, and she does not add in words, "And you are out." Even the dog is hostile, silently disdainful. "Another old fool trying to see the master," it insinuates. But my card throws down all defense and a moment later I am shaking (very gently) the rather limp hand of the man I would have gone far to see.

Pathetically he points to a pile of opened letters, ankle-deep, on the floor. "Today's crop," he says. A smaller pile lies on the desk and must be answered. We must hurry, though there is no mistaking his genuine pleasure to see me.

"Well, what about this recent misconduct of yours?" I ask, sternly.

Candidly he is puzzled, and I have to tell him that the world is shocked or elated, according to the length of its hair, at his recent pronouncement on the future life—I mean, on the absence of a future life. Henry Ford, his friend, had recently declared his belief, not only in incarnation, but in reincarnation. Henry always does things big, and, incidentally, it is always the people who know most about *machines*—Kelvin, Lodge, Faraday, Ford—who talk most about *spirit*. Psychologists and biologists, who ought to know, are very shy of spirits.

However, Burbank was asked what he thought about the matter, and he did not speak in parables. We no more survive, he said, to the representative of the San Francisco *Bulletin*, than does the automobile you fling on the scrap-heap. Those are his words. We survive only in "the good we have done in passing through." Souls? Why, said Burbank, "the universe is not big enough to contain perpetually all the human souls and the other living beings that have been here for their short span." Very comforting to some people, these religions, he said, but "as a scientist I cannot help feeling that all religions are on a tottering foundation." God? Well, there is "a great universal power," but whether it is "a conscious mind" or not, Luther Burbank did not know. What is worse, he did not care. "As a scientist I should like to know, but as a man I am

not so vitally concerned." No wonder California, the land of saints and angels, wept.

Not much to be added to, or explained, in that," Mr. Burbank said to me, smiling. He disliked talking. Looking rather frail, pale and artistic—he somehow reminded me at once of my good friend Eden Phillpotts, the most artistic of living writers after D'Annunzio—he seemed born to finger a brush or a pen, not a spade. Artist he was, of course: the great artist of modern science. He *worked* with its flower. He did not speculate about it.

"There is nothing at all new in this interview," he said. I had, of course, read his *Training of the Human Plant*, and had for that enshrined him in my *Dictionary of Modern Rationalists*, but, on the rare occasions when he does speak in public, he speaks out in a way that goes far to redeem the credit of American science. "Here," he said to me, "you have the sentiments I lately expressed *in the pulpit of a chapel* at Santa Rosa."

It was just the same outspoken denunciation of theology. "No avenging Jewish God, no Satanic devil, no fiery hell, is of any interest to me," he said. Jesus? He liked the literary figure, but "the clear light of science teaches us that we must be our own saviors." God? "The God within us is the only available God we know." We must come out from "behind theological barbed-wire fences," into "the great ocean of scientific truth." "Science, unlike theology, never leads to insanity." The word "ceremony," he pungently said, "is derived from "cerements" or "grave clothes." Very topical,

in a chapel. Religion is a matter of feeling, and "feelings are all right if one does not get drunk on them." "Obsolete misleading theologies," he said, "bear the same relation to the essence of true religion that scarlet fever, mumps, and measles do to education." But what will become of the children? If there was one thing Burbank was zealous about it was the training of children, and children are, he said, "the greatest sufferers from outgrown theologies."

No, there is not much to add to that. Luther II threw his ink-pot at the devil—the parson—with a vigor that surprises when one recalls the fleshy physique of the first Luther, and contrasts it with the gentleness and silver hair of the second. But he is as disgusted as I at the "timidity" of his brother scientists in America. I explain, almost apologetically, that I have entitled an article "The Cowardice of American Scientists."

"Quite right," he says. "And it is not only cowardice, but wrong tactics. What is the use of assuring Fundamentalists that science is compatible with religion. They retort at once, 'Certainly not with our religion.'"

Burbank uses the word religion, but it is never misleading. It is, he says, "justice, love, truth, peace and harmony, a serene unity with science and the laws of the universe." It is idealism, and there is not the slightest countenance of any sort of theology in Burbank's use of the word.

I remind him that Dr. David Starr Jordan is

popularly supposed to have hinted that his friend went too far.

"Not in the least," he says disdainfully. "Jordan is one of my best friends, and thinks as I do."

And, in fact, though the language is a little more diplomatic, Jordan's pronouncement is, substantially, Agnosticism. Mr. Burbank did not believe in knocking a man down when it is not good for him to stand up. He provided a chair. Dr. David Starr Jordan is inclined to provide a feather bed. There *are* physicians who think a wooden chair the most healthful seat. Anyhow, there is no Millikanism or Osbornism about either of these two fine American gentlemen.

"Bryan—a great friend of mine, by the way—had a Neanderthal type of head," Burbank says. "As to Riley, he has not even the oratorical skill of Bryan. The whole movement is based on the poor whites of the south."

I remind him of the ten million religious colored people of the United States.

"Yes, another big element in the movement," he assents. "And to think of this great country in danger of being dominated by people ignorant enough to take a few ancient Babylonian legends as the canons of modern culture. Our scientific men are paying for their failure to speak out earlier. There is no use now talking evolution to these people. Their ears are stuffed with Genesis."

I almost felt at times as though I were talking to Darwin, and I expected some deprecation of my vigor and lack of diplomacy, such as Dar-

win used gently to administer to Haeckel. Not a bit. I took courage and remarked that Fundamentalism must be fought "with both fists."

"Of course it must," he said, "and our scientific men must be criticized boldly. They will not feel comfortable when you and I are through with them."

He spoke with envy of the Rationalist Press of England and its honorable company of distinguished men of science and letters. I told him that I am to do a bigger work in America than I have ever done in England. "Mr. Haldeman-Julius," I began. . . .

"Doing splendid work," he said. "Can we have some of these Little Blue Books to help in the work?"

He lighted up with enthusiasm when I described the plan which Mr. Haldeman-Julius and I have hatched—fifty Little Blue Books covering the entire ground of religious controversy and inquiry, systematically and courteously, but firmly and inexorably.

"That will be magnificent help," he said. "And let us have some of the Big Blue Books too."

I explained that some of the latter are already in circulation and more of a Rationalist nature will come. The old man was visibly delighted. Almost alone in his scientific world he outspokenly disdained creeds and ceremonies. Undermining ancient dogmas is not enough. The people, who begin to see the power of science, must know what men of science, with their trained minds and their grasp of realities, think about man and the universe.

So out I went, to continue my mission in California, with the hearty "good-speed" of this wondrous man. Santa Rosa, nay California, is proud of him, and there must be some temptation to avoid friction. What, no danger in California? Why, here in a suburb of San Francisco I hear of an audience of five thousand Fundamentalists rocking with laughter at some of the elementary truths of science. Even the educated run after iridescent verbiage and shun facts. Hindu word-spinners dig gold here.

As I sped away my eye caught a board in a field by the road: "Jesus is the way, the truth and the life," it said. This after 1900 years experimental verification of his efficacy! And in the heart of California, where Luther Burbank showed that the only way and truth and life is science. All honor to him that he did not leave it to such obtuse minds to "draw their own conclusions," as so many do. "Science is the only savior," he said to people. He said it in church one memorable day.

"I very rarely speak in public, and, curiously, my two addresses are in churches," he said, eyeing me, I thought, apprehensively.

"I know no better place to say such things," I retorted, and I thought sadly of the very different things which American men of science had recently been saying in the churches of Kansas City during the convention of the American Association for the Advancement of Science.

THE REPUBLIC OF PLATO.

(The editor of this compendium of the Republic of Plato acknowledges his indebtedness to the analysis and notes compiled by John L. Davies and David J. Vaughan, Trinity College, Cambridge, England.)

THE REPUBLIC OF PLATO

The Republic of Plato is written in the form of a dialogue. The persons who take part in the conversations are Socrates, Cephalus, Polemarchus the son of Cephalus, Glaucon and Adeimantus, brothers of Plato, and Thrasymachus.

Socrates and Glaucon, having gone down to the Piraeus to attend the festival in honor of the Thracian goddess Bendis, fall in with Polemarchus, Adeimantus, Niceratus, and some other friends, who persuade them to proceed to the house of Cephalus. There a conversation upon the subject of old age, its faults and trials, carried on between Cephalus and Socrates, finally introduces the question, What is Justice? At this Cephalus retires, leaving Polemarchus and Socrates to continue the discussion.

Polemarchus begins by propounding a definition of justice given by Simonides, who makes it consist in restoring to everybody what is due to him. The question, then, is what did Simonides mean by the term "due?" Apparently he meant little more than "appropriate"; for, according to him, the nature of the debt depends upon the nature of the relation existing between the two parties; so that, in reality, he makes justice consist in doing good to our friends, and harm to our enemies.

Socrates then asks Polemarchus to define the terms "friends"; and when the latter replies

that our friends are those whom we regard as good and honest men, Socrates shows that, as we are constantly liable to misjudge the characters of people, we must maintain either that it is just to injure the good, which is an immoral doctrine; or else that it is occasionally just to injure our friends, which directly contradicts the doctrine of Simonides. To escape from this dilemma Polemarchus shifts his ground, and states the theory of Simonides thus: It is just to help our friends if they are good men, and to injure our enemies if they are bad men.

The conversation proceeds:

Socrates: Must we restore to our enemies whatever happens to be due to them?

Polemarchus: Yes, no doubt—what is due to them; and the debt of enemy to enemy is, I imagine, harm; because harm is at the same time appropriate to such a relation.

Socrates: So then it would seem that Simonides, after the manner of poets, employed a riddle to describe the nature of justice; for apparently he thought that justice consisted in rendering to each man that which is appropriate to him, which he called his due. But here let me entreat you to give me your opinion. Suppose that consequently some one had asked him the following question: "That being the case, Simonides, what due and appropriate thing is rendered by the art called medicine, and what are the recipients?" What answer do you think he would have returned us?

Polemarchus: Obviously he would have said that bodies are the recipient, and drugs, meats, and drinks the things rendered.

Socrates: And what due and appropriate thing is rendered by the art called cookery, and what are the recipients?

Polemarchus: Seasoning is the thing rendered; dishes are the recipients.

Socrates: Good; then what is the thing rendered by the art that we are to call justice, and who are the recipients?

Polemarchus: If we are to be at all guided by our previous statements, Socrates, assistance and harm are the things rendered, friends and enemies the recipients.

Socrates: Then, by justice, Simonides means doing good to our friends, and harm to our enemies, does he?

Polemarchus: I think so.

In reply to this, Socrates, arguing from analogy, shows that to injure a man is tantamount to making him less virtuous, and therefore less just. But how can a just man, by the exercise of his justice, render the character of another less just than it was? The idea is preposterous. Therefore, the definition of Simonides, as amended by Polemarchus, is again proved to be incorrect.

Socrates: Now is it the act of a just man to hurt anybody?

Polemarchus: Certainly it is; that is to say, it is his duty to hurt those who are both wicked, and enemies of his.

Socrates: Are horses made better, or worse, by being hurt?

Polemarchus: Worse.

Socrates: Worse with reference to the excellence of dogs, or that of horses?

Polemarchus: That of horses.

Socrates: Are dogs in the same way made worse by being hurt, with reference to the excellence of dogs, and not of horses?

Polemarchus: Unquestionably they are.

Socrates: And must we not, on the same principle, assert, my friend, that men, by being hurt, are lowered in the scale of human excellence?

Polemarchus: Indeed we must.

Socrates: But is not justice a human excellence?

Polemarchus: Undoubtedly it is.

Socrates: And therefore, my friend, those men who are hurt must needs be rendered less just.

Polemarchus: So it would seem.

Socrates: Can musicians, by the art of music, make men unmusical?

Polemarchus: They cannot.

Socrates: Can riding-masters, by the art of riding, make men bad riders?

Polemarchus: No.

Socrates: But if so, can the just by justice make men unjust? In short, can the good by goodness make men bad?

Polemarchus: No, it is impossible.

Socrates: True; for, if I am not mistaken, it is the property, not of warmth, but of its opposite, to make things cold.

Polemarchus: Yes.

Socrates: And it is the property, not of drought, but of its opposite, to make things wet.

Polemarchus: Certainly.

Socrates: Then it is the property, not of good, but of its opposite, to hurt.

Polemarchus: Apparently it is.

Socrates: Well, is the just man good?

Polemarchus: Certainly he is.

Socrates: Then, Polemarchus, it is the property, not of the just man, but of his opposite, the unjust man, to hurt either friend or any creature.

Polemarchus: You seem to me to be perfectly right, Socrates.

Socrates: Hence, if anyone asserts that it is just to render to every man his due, and if he understands by this that what is due on the part of the just man is injury to his enemies and assistance to his friends, the assertion is that of an unwise man. For the doctrine is untrue; because we have discovered that, in no instance, is it just to injure anybody.

Hereupon Thrasymachus thrusts himself into the discussion, and, after some hesitation, defines justice as "the interest of the stronger." He supports his definition by the following argument: In every state it is considered unjust to violate the laws; the laws are framed to serve the interests of the government; and the government is stronger than its subjects; therefore, universally, justice is in the interest of the stronger, or might is right.

But, urges Socrates, a government becomes tyrannical; its laws become oppressive to the masses; and, according to the views of Thrasymachus, justice would require the subject in every instance to obey the laws of the ruling class.

To avoid this conclusion, Thrasymachus

argues that a ruler, in so far as he is a ruler, cannot be said to do wrong; therefore justice always commands the subject to be loyal to the rulers.

Socrates, in reply, demonstrates that every art, and therefore, among others, the art of government, should consult the interests, not of the artist or superior, but of the subject and inferior.

Thrasymachus then turns the discourse by declaring that a ruler treats his subjects just like the shepherd who fattens his flock for his own private advantage; and that justice, practiced by the ruling class, becomes the most lucrative course that it can adopt.

Socrates contradicts the assertion that the shepherd should fatten his flock only for his own private benefit; the shepherd, in so far as he is a shepherd, should simply consider the good of his sheep. Further, why should a ruler expect to be paid for his work, except on the supposition that the benefits of his rulership accrue, not to himself, but to the community? Indeed, strictly speaking, says Socrates, every artist is really remunerated, not by money only, but by what he terms "the art of wages." He then proceeds to show that injustice in any form tends to produce strife and diversion, while justice alone induces harmony and concord; that injustice always destroys all capacity for co-operative action in both states and individuals, and therefore is an element of weakness, and not of strength.

Finally Socrates endeavors to show that the soul, like the eye, and the ear, and every other thing, has a work or function to perform, and possesses a virtue by which alone it can be enabled to perform that work. This virtue

of the soul is justice; and without justice the work of the soul of man cannot be performed; and the soul itself cannot progress or be happy. Hence only the just man is happy, while the unjust is miserable; therefore only justice is profitable; so Socrates asks:

Are the rulers infallible in each several city, or are they liable to make a few mistakes?

Thrasymachus: No doubt they are liable to make mistakes.

Socrates: And therefore, when they undertake to frame laws, is their work sometimes rightly, and sometimes wrongly done?

Thrasymachus: I should suppose so.

Socrates: Do "rightly" and "wrongly" mean, respectively, legislation for, and against their own interests? or how do you state it?

Thrasymachus: Just as you do.

Socrates: And do you maintain that whatever has been enacted by the rulers must be obeyed by their subjects, and that this is justice?

Thrasymachus: Unquestionably I do.

Socrates: Then, according to your argument, it is not only just to do what makes for the interest of the stronger, but also to do what runs counter to his interest—in other words, the opposite of the former.

Thrasymachus: What are you saying?

Socrates: What you say, I believe. But let us examine the point more thoroughly. Has it not been admitted that, when the rulers enjoin certain acts upon their subjects, they are sometimes thoroughly mistaken as to what is best for themselves; and that, whatever is

enjoyed by them, it is just for their subjects to obey?

Socrates, having obtained the admission that the virtue of the soul must be justice, continues:

Come, then, consider this point next: Has the soul any function which could not be executed by means of anything else whatsoever? For example, could we in justice assign superintendence and government, deliberation and the like, to anything but the soul, or should we pronounce them to be peculiar to it?

Thrasymachus: We could ascribe them to nothing else.

Socrates: Again, shall we declare life to be a function of the soul?

Thrasymachus: Decidedly.

Socrates: Do we not also maintain that the soul has a virtue?

Thrasymachus: We do.

Socrates: Then can it ever so happen, Thrasymachus, that the soul will perform its functions well when destitute of its own peculiar virtue, or is that impossible?

Thrasymachus: Impossible.

Socrates: Then a bad soul must needs exercise authority and superintendence ill, and a good soul must do all these things well.

Thrasymachus: Unquestionably.

Socrates: Now did we not grant that justice was a virtue of the soul, and injustice a vice?

Thrasymachus: We did.

Socrates: Consequently the just soul and the just man will live well, and the unjust man ill?

Thrasymachus: Apparently, according to your argument.

Socrates: And you will allow that he who lives well is blessed and happy, and that he who lives otherwise is the reverse.

Thrasymachus: Unquestionably.

Socrates: Consequently the just man is happy and the unjust man miserable.

Thrasymachus: Let us suppose them to be so.

Socrates: But surely it is not misery, but happiness, that is advantageous.

Thrasymachus: Undoubtedly.

Socrates: Never, then, my excellent Thrasymachus, is injustice more advantageous than justice.

In the second Book of the Republic of Plato, Glaucon and Adeimantus resume the place which Thrasymachus has resigned. They would gladly believe that a just life is really preferable to an unjust life; but they cannot help thinking that too much stress has been laid by the eulogists of justice upon its accidental advantages, to the neglect of its intrinsic qualities. Would not a person be quite ready to commit injustice, if he could be sure of never suffering from the injustice of other men? Is not justice a kind of compromise, brought about by the necessities of social life? Do the poets ever praise it in, and for, itself? And, assuming the existence of the gods, how do they regard the just and the unjust man? May not the sins of the latter be expiated by sacrifice; and, in that case, will he not be as happy as the just man in the next world, and is he not much happier than the just in the present life?

Socrates acknowledges the difficulty of the question, and proposes to examine the nature of justice and injustice in a wider field, and on a larger scale. May not justice be applied to a state of society, as well as to an individual? And, if so, will it not be more fully developed, and therefore more intelligible, and more conducive to universal happiness, in the state than in the individual? He proposes to trace the rise of the state; to ascertain upon what manner of foundation it is built and in that way disclose the workings of justice and injustice.

Man, isolated from his fellowmen, is not self-sufficient. Hence the origin of society, and of the state, which requires the superintendence of a number of officials, who establish the first elements of a division of labor, which becomes more complex as the members of the community increase. Thus the society comprises at first only tillers of the soil, builders, clothing makers, shoemakers. To these are soon added carpenters, smiths, shepherds, etc. Gradually a foreign trade arises, which necessitates increased production at home, in order to pay for the imported goods. Production carried on upon so large a scale will call into existence a class of distributors, shops, and a currency. Thus there grows up in the state merchants, sailors, shop-keepers, and a laboring class, that does the productive work, but receives but a small portion of the result of its labor.

A state, thus constituted, will be well supplied with the necessities of life, if its members do not multiply too rapidly for its resources.

(This, of course, refers to a period when hand-labor was entirely relied on.)

If the state, finally, is to be supplied with luxuries, as well as with the necessities of life, it must contain cooks, confectioners, barbers, actors, dancers, poets, teachers, physicians, etc. It will also require a larger territory, which involves it in war with other states; and war calls into existence trained soldiers. This brings about a standing army, or a class that may be called Guardians.

How are these Guardians to be selected, and what qualities must they possess? They must be strong and fearless. How should they be educated? We must be very scrupulous about the substance of the stories which they are taught in childhood. Children, with rare exceptions, believe through life whatever is told them in their younger years. Nothing derogatory to the dignity of, or denial of faith in the gods must be allowed.

"Take into consideration," said Adelmantus, addressing Socrates, "another and a different mode of speaking with regard to justice and injustice, which we meet with both in common life and in the poets. All as with one mouth proclaim that to be temperate and just is an admirable thing certainly, but at the same time a hard and an irksome one; while intemperance and injustice are pleasant things and of easy acquisition, and only rendered base by law and public opinion. But they say that honesty is in general less profitable than dishonesty, and they do not hesitate to call wicked men happy, and to honor them both in public and in private, when they are rich or possess other sources of power, and on the other hand to treat with dishonor and contempt those who are in any way feeble or poor, even while they admit that the latter are better men than the former. But of all their statements the most

wonderful are those which relate to the gods and to virtue; according to which even the gods allot to many good men a calamitous and an evil life, and to men of the opposite character an opposite portion. And there are quacks and soothsayers who flock to the rich man's door, and try to persuade him that they have a power at command, which they procure from heaven, and which enables them, by sacrifices and incantations, to make amends for any crime committed either by the individual himself or by his ancestors; and that, should he desire to do a mischief to any one, it may be done at a trifling expense, whether the object of his hostility be a just or an unjust man; for they profess that by certain invocations and spells they can prevail upon the gods to do their bidding. And in support of all these assertions they produce the evidence of poets; some, to exhibit the facilities of vice, quoting the words (from Hesiod)—

“Whoso wickedness seeks, may even in masses obtain it

Easily. Smooth is the way, and short, for
—nigh is her dwelling.

Virtue, Heaven has ordained, shall be reached
by the sweat of the forehead,”

and by a long and up-hill road; while others, to prove that the gods may be turned from their purpose by men, adduce the testimony of Homer, who has said:

“Yea, even the gods do yield to entreaty;
Therefore to them men offer both victims
and meek supplications,

Incense and melting fat, and turn them from
anger to mercy;

Sending up sorrowful prayers, when trespass
and sin is committed.”

And they produce a host of books, written by Musaeus and Orpheus, children, as they say, of Selene and of the Muses, which forms their ritual—persuading not individuals only, but whole cities also, that men may be absolved and purified from crimes, both while they are still alive and even after their decease, by means of certain sacrifices and pleasurable amusements which they call Mysteries; which deliver us from the torments of the other world, while the neglect of them is punished by an awful doom.

When views like these, he continued, my dear Socrates, are proclaimed and repeated with so much variety, concerning the honors in which virtue and vice are respectively held by gods and men, what can we suppose is the effect produced on the minds of all those young men of good natural parts who are able, after skimming like birds, as it were, over all that they hear, to draw conclusions from it, respecting the character which a man might possess, and the path in which he must walk, in order to live the best possible life? In all probability a young man would say to himself in the words of Pindar, "Shall I by justice or by crooked wiles climb to a loftier stronghold, and, having thus fenced myself about, live my life? For common opinion declares that to be just without being also thought just, is no advantage to me, but only entails manifest trouble and loss; whereas if I am unjust and get myself a name for justice, an unspeakably happy life is promised me. Very well then; since the outward semblance, as the wise inform me, overpowers the inward reality, and is the sovereign dispenser of felicity, to this I must of course wholly devote myself; I must draw round about me a picture

of virtue to serve as a frontage and exterior, but behind me I must trail the fox * * * For if we are just, we shall, it is true, escape punishment at the hands of the gods, but we renounce the profits which accrue from injustice; but if we are unjust, we shall not only make these gains, but also by putting up prayers when we transgress and sin, we shall prevail upon the gods to let us go unscathed."*

In answer to the words of Adeimantus Socrates replies:

There is something truly god-like in the state of your minds, if you are not convinced that injustice is better than justice, when you can plead its cause so well. I do believe that you really are not convinced of it. But I infer it from your general character; for judging merely from your statements I should have distrusted you; but the more I place confidence in you, the more I am perplexed how to deal with the case; for though I do not know how I am to render assistance, having learnt how unequal I am to the task from your rejection of my answer to Thrasymachus, wherein I imagined that I had demonstrated that justice is better than injustice; yet, on the other hand, I dare not refuse my assistance; because I am afraid that it might be positively sinful in me, when I hear Justice evil spoken of in my presence, to lose heart and desert her, so long as breath and utterance are left in me. My best plan, therefore, is to succor her in such fashion as I can.

At this Glaucon, together with the others, requested Socrates to investigate the real nature

*(The book containing this passage is lost. It does not appear in any of Pindar's extant works.)

ture of justice and injustice, as applied to both the individual and the state, and in answer to this request a conversation takes place between Socrates and Adeimantus.

Socrates: We speak of justice as residing in an individual mind, and as residing also in an entire city, do we not?

Adeimantus: Certainly we do.

Socrates: Well, a city is larger than one man.

Adeimantus: It is.

Socrates: Perhaps, then, justice may exist in larger proportions in the greater subject, and thus be easier to discover; so, if you please, let us first investigate its character in cities; afterwards let us apply the same inquiry to the individual, looking for the counterpart of the greater as it exists in the form of the less.

Adeimantus: Indeed, I think your plan is a good one.

Socrates: If then we are to trace in thought the gradual formation of a city, should we also see the growth of its justice or of its injustice?

Adeimantus: Perhaps we should.

Socrates: Then, if this were done, might we not hope to see more easily the object of our search?

Adeimantus: Yes, much more easily.

Socrates: Is it your advice, then, that we should attempt to carry out our plan? It is no trifling task, I imagine; therefore consider it well.

Adeimantus: We have considered it; yes, do so by all means.

With this, Socrates proceeds: The formation of a city is due, as I imagine, to this fact, that we are not individually independent, but have many wants. Or would you assign any other cause for the founding of cities?

Adeimantus: No, I agree with you.

Socrates: Thus it is, then, that owing to our many wants, and because each seeks the aid of others to supply his various requirements, we gather many associates and helpers into one dwelling place, and give to this joint dwelling the name of city. Is it so?

Adeimantus: Undoubtedly.

Socrates: And every one who gives or takes in exchange, whatever it be that he exchanges, does so from a belief that he is consulting his own interest.

Adeimantus: Certainly.

Socrates: Now then, let us construct our imaginary city from the beginning. It will owe its construction, it appears, to our natural wants.

Adeimantus: Unquestionably.

Socrates: Well, but the first and most pressing of all wants is that of sustenance to enable us to exist as living creatures.

Adeimantus: Most decidedly.

Socrates: Our second want would be that of a house, and our third that of clothing and the like.

Adeimantus: True.

Socrates: Then let us know what will render our city adequate to the supply of so many things. Must we not begin with a husbandman for one, and a housebuilder, and besides these a weaver? Will these suffice, or

shall we add to them a shoemaker, and perhaps one or two more of the class of people who minister to our bodily wants?

Adeimantus: By all means.

Socrates: Then the smallest possible city will consist of four or five men.

Adeimantus: So we see.

Socrates: To proceed then; ought each of these to place his own work at the disposal of the community, so that the single husbandman, for example, shall provide food for four, spending four times the amount of time and labor upon the preparation of food, and sharing it with others; or must he be regardless of them, and produce for his own consumption alone the fourth part of this quantity of food, in a fourth part of the time, spending the other three parts, one in making his house, another in procuring himself clothes, and the third in providing himself with shoes, saving himself the trouble of sharing with others, and doing his own business by himself, and for himself?

Adeimantus: Well, Socrates, perhaps the former plan is the easier of the two.

Socrates: Really, it is not improbable; for I recollect, myself, after your answer, that, in the first place, no two persons are born exactly alike, but each differs from each in natural endowments, one being suited for one occupation, and another for another. Do you not think so?

Adeimantus: I do.

Socrates: Well; when is a man likely to succeed best? When he divides his exertions among many trades, or when he devotes himself exclusively to one?

Adeimantus: When he devotes himself to one.

Socrates: Again, it is also clear, I imagine, that if a person lets the right moment for any work go by, it never returns.

Adeimantus: It is quite clear.

Socrates: For the thing to be done does not choose, I imagine, to tarry the leisure of the doer, but the doer must be at the beck of the thing to be done, and not treat it as a secondary affair.

Adeimantus: He must.

Socrates: From these considerations it follows that all things will be produced in superior quantity and quality, and with greater ease, when each man works at a single occupation in accordance with his natural gifts, and at the right moment, without meddling with anything else.

Adeimantus: Unquestionably.

Socrates: More than four citizens, then, Adeimantus, are needed to provide the requisites which we named. For the husbandman, it appears, will not make his own plow, if it is to be a good one, nor his mattock, nor any of the other tools employed in agriculture. No more will the builder make the numerous tools which he also requires; and so of the weaver and the shoemaker.

Adeimantus: True.

Socrates: Then we shall have carpenters and smiths, and many other artisans of the kind, who will become members of our little state, and create a population.

Adeimantus: Certainly.

Socrates: Still it will not yet be very large, supposing we add neatherds and shepherds,

and the rest of that class, in order that the husbandmen may have oxen for plowing, and the house-builder, as well as the husbandmen, beasts of burden for draughts, and the weavers and shoemakers wool and leather.

Adeimantus: It will not be a small state, either, if it contains all these.

Socrates: Moreover, it is scarcely possible to plant the actual city in a place where it will have no need of imports.

Adeimantus: No, it is impossible.

Socrates: Then it will further require a new class of persons to bring from other cities all that it requires.

Adeimantus: It will.

Socrates: Well, but if the agent goes empty-handed, carrying with him none of the commodities in demand among those people from whom our state is to procure what it requires, he will also come empty-handed; will he not?

Adeimantus: I think so.

Socrates: Then it must produce at home not only enough for itself, but also articles of the right kind and quantity to accommodate those whose services it needs.

Adeimantus: It must.

Socrates: Then our city requires larger numbers both of husbandmen and other craftsmen.

Adeimantus: Yes, it does.

Socrates: Then we shall require merchants also.

Adeimantus: Certainly.

Socrates: And if the traffic is carried on by sea, there will be a further demand for a con-

siderable number of other persons skilled in the practice of navigation.

Adeimantus: A considerable number, undoubtedly.

Socrates: But now tell me; in the city itself how are they to exchange their several productions? For it was to promote this exchange, you know, that we formed the community, and so founded the state.

Adeimantus: Manifestly, by buying and selling.

Socrates: Then this will give rise to a market and a currency, for the sake of exchange.

Adeimantus: Undoubtedly.

Socrates: Suppose then that the husbandman, or one of the other craftsmen, should come with some of his produce into the market, at a time when none of those who wish to make an exchange with him are there, is he to leave his occupation and sit idle in the market-place?

Adeimantus: By no means; there are persons who, with an eye to this contingency, undertake the service required; and these in well regulated states are, generally speaking, persons of excessive physical weakness, who are of no use in other kinds of labor. Their business is to remain on the spot in the market, and give money for goods to those who want to sell, and goods for money to those who want to buy.

Socrates: This demand, then, causes a class of retail dealers to spring up in the city. For do we not give the name of retail dealers to those who station themselves in the market, to minister to buying and selling, applying the term merchants to those who go about from city to city?

Adeimantus: Exactly so.

Socrates: In addition to these, I imagine there is also another class of operatives, consisting of those whose mental qualifications do not recommend them as associates, but whose bodily strength is equal to hard labor; these, selling the use of their strength and calling the price of it hire, are thence named, I believe, hired laborers. Is it not so?

Adeimantus: Precisely.

Socrates: Then hired laborers also form, as it seems, a complementary portion of the state.

Adeimantus: I think so.

Socrates: Shall we say then, Adeimantus, that our city has at length grown to its full stature?

Adeimantus: Perhaps so.

WHERE SHALL WE FIND JUSTICE?

Socrates: Where then, I wonder, shall we find JUSTICE and INJUSTICE in it? With which of these elements that we have contemplated, has it simultaneously made its entrance?

Adeimantus: I have no notion, Socrates, unless perhaps it be discoverable somewhere in the mutual relations of these same persons.

Socrates: Well, perhaps you are right. We must investigate the matter, and not flinch from the task. Let us consider then, in the first place, what kind of life will be led by persons thus provided. I presume they will produce corn and wine, and clothes and shoes,

and build themselves houses; and in summer, no doubt, they will generally work without their coats and shoes, while in winter they will be suitably clothed and shod. And they will live, I suppose, on barley and wheat, baking cakes of the meal, and kneading loaves of the flour. And spreading these excellent cakes and loaves upon mats of straw or on clean leaves, and themselves reclining on rude beds of yew or maple-boughs, they will make merry, themselves and their children, drinking their wine, wearing garlands, and singing praises of the gods, enjoying one another's society, and not begetting children beyond their means, through a prudent fear of poverty or war.

Here Glaucon interrupted, remarking: Apparently you describe your men as feasting without anything to relish their bread.

Socrates: True, I had forgotten. Of course they will have something to relish their food; salt, no doubt, and olives and cheese, together with the country fare of boiled onions and cabbage. We shall also set before them a dessert, I imagine, of figs and peas and beans; and they may roast myrtle-berries and beech-nuts at the fire, taking wine with their fruit in moderation. And thus passing their days in tranquility and sound health they will, in all probability, live to an advanced age, and dying, bequeath to their children a life in which their own will be reproduced.

Upon this Glaucon exclaimed, Why Socrates, if you were founding a community of swine, this is just the style in which you would feed them up!

Socrates: How, then, would you have them live, Glaucon?

Glaucon: In a civilized manner. They ought to recline on couches, I should think, if they are not to have a hard life of it, and dine off tables, and have the usual dishes and desserts of a civilized dinner.

Socrates: Very good; I understand. Apparently we are considering the growth not of a city merely, but of a luxurious city. I dare say it is not a bad plan; for by this extension of our inquiry we shall perhaps discover how it is that justice and injustice take root in cities. Now it appears to me that the city which we have described is the genuine and, so to speak, healthy city. But if you wish us also to contemplate a city that is suffering from inflammation, there is nothing to hinder us. Some people will not be satisfied, it seems, with the fare or the mode of life which we have described, but must have, in addition, couches and tables and every other article of furniture, as well as viands, and fragrant oils, and perfumes, and courtesans, and confectionery; and all these in plentiful variety. Moreover, we must not limit ourselves now to essentials in those articles which we specified at first. I mean houses and clothes and shoes—but we must set painting and embroidery to work, and acquire gold and ivory, and all similar valuables. Must we not?

Glaucon: Yes.

Socrates: Then we shall have to enlarge our city, for our first or healthy city will not now be of sufficient size, but requires to be increased in bulk, and filled out with a multitude of callings, which do not exist in cities to satisfy any natural want; for example, the whole class of sportsmen, and all who practice imitative arts, including many who use

forms and colors, and many who use music, poets also, with those of whom the poet makes use, rhapsodists, actors, dancers, contractors; lastly, the manufacturers of all sorts of articles, and among others those which form part of a woman's dress. We shall similarly require more personal servants, shall we not? that is to say, tutors, wet-nurses, dry-nurses, tire-women, barbers, and cooks moreover and confectioners? Swineherds again are among the additions we shall require—a class of persons not to be found, because not wanted, in our former city, but needed among the rest in this. We shall also need great quantities of cattle, for those who may wish to eat them, shall we not?

Glaucon: Of course we shall.

Socrates: Then shall we not experience the need of medical men also, to a much greater extent under this than under the former regime?

Glaucon: Yes, indeed.

Socrates: The country, too, I presume, which was formerly adequate to the support of its inhabitants will be now too small, and adequate no longer.

Glaucon: Certainly.

Socrates: Then must we not go to war, and cut ourselves a slice of our neighbor's territory, if we are to have land enough both for pasture and tillage, while they will try to do the same to us, if they, like us, permit themselves to overstep the boundaries of natural human requirements, and plunge into the unbounded acquisition of wealth?

Glaucon: It must inevitably be so, Socrates.

Socrates: Then we will be often plunged into war, Glaucon, or how will it be?

Glaucon: As you say.

Then, declares Socrates, We have traced the origin of war to causes which are the most fruitful sources of whatever evils befall a state, either in its corporate capacity, or in its individual members.

In the third Book of the Republic of Plato the methods to be followed in the instruction of Guardians, or soldiers, is described. Truth, courage, and self-control must be inculcated by all the stories that are employed in their education. Also the form, in which the stories are conveyed, will greatly affect the nature of their influence. Poetry may be either purely imitative, as in the drama; or purely narrative, as in the dithyramb; or a compound of both, as in the epic. The same person cannot do, or imitate, a great number of things successfully. Hence, if the Guardians are to study imitation at all, they must only be allowed to imitate men of high social standing. The style in which such men speak and write is always conservative and severe; such, therefore, must be the style in which the Guardians are allowed to speak, and in which the poets who superintend their education must be compelled to write.

Strict regulations must be enforced with reference to songs and musical instruments. No soft or sympathetic music should be heard by the Guardians. Their diet must be simple and moderate, and therefore healthy.

The rulers of the state must be of the military class. The remainder of society are to be called Auxiliaries; and in order to convince the masses of the wisdom and justice

of this order of things, they must be told a story, to the effect that they were all originally fashioned in the bowels of the earth, their common mother; and that it pleased the gods to mix gold in the composition of some of them, silver in that of others, iron and copper in that of others. Those in whom gold are mixed are the "powers that be," ordained of the gods; those in whom silver is mixed are the political and religious Auxiliaries of the powers that be; those in whom iron and copper are mixed are the workers.

The Guardians are to live hardy, frugal lives, quartered in tents, not in houses, supported by taxing the public. Adeimantus objects to the severe life, saying it will be anything but a pleasurable one. Perhaps so, replies Socrates; but it is a necessary life.

Then, having traced the rise of a state from first to last, Socrates returns to the question, What is Justice? and in what part of the state are we to look for it. The state, if it has been rightly organized, must be perfectly good. If perfectly good, it must be wise, brave, temperate and just. Hence, regarding the virtue of the state as a given quantity, made up of wisdom, courage, temperance and justice, if we can find three of these, we shall by that very process have discovered the nature of the fourth.

The wisdom of the state resides in the small class of Guardians and Magistrates. The courage of the state resides in the Auxiliaries, and consists essentially in ever maintaining a right estimate of what is, or is not, formidable. The sustenance of the state obviously resides in the husbandmen and craftsmen.

The essence of temperance is restraint. The

essence of political temperance lies in recognizing the right of the governing body to the allegiance and obedience of the governed. It does not reside in one particular class, like wisdom and courage, but is diffused throughout the entire state in the form of a common consent, or harmony, upon this subject. Thus the three virtues appear; where, then, is the fourth?

After eliminating wisdom, courage and temperance, there still remains a something which enables the other three to take root in the state, and preserves them intact therein. This something must be justice. It may be defined as that which teaches everybody to attend to his own business without meddling in that of other people—which fuses together the three classes in the state and keeps each in its proper place. Conversely, the essence of political injustice lies in a meddling, restless spirit pervading the three classes, and leading each to meddle with the offices, tools and duties of the other two.

We should examine, said Socrates, whether our object in constituting our guardians should be to secure to them the greatest possible amount of happiness, or whether our duty, as regards happiness, is to see if our state as a whole enjoys it, persuading or compelling these our auxiliaries and guardians to study only how to make themselves the best possible workmen at their occupation, and treating all the rest in like manner; and thus, while the whole city grows and becomes prosperously organized, permitting each class to partake of as much happiness as the nature of the case allows it.

To which Adeimantus replied: I think that what you say is quite right.

Socrates: I wonder whether you will think the proposition that is sister to the last satisfactory also.

Adeimantus: What may that be?

Socrates: Consider whether the other craftsmen are similarly injured and spoiled by these agencies.

Adeimantus: What agencies do you mean?

Socrates: Wealth and poverty.

Adeimantus: How so?

Socrates: Thus: Do you think that a potter after he has grown rich will care to attend to his trade any longer?

Adeimantus: Certainly not.

Socrates: But he will become more idle and careless than he was before?

Adeimantus: Yes, much more.

Socrates: Then does he not become a worse potter?

Adeimantus: Yes, a much worse potter, too.

Socrates: On the other hand, if he is prevented by poverty from providing himself with tools or any other requisite of his trade, he will produce inferior articles, and his sons or apprentices will not be taught their trade so well.

Adeimantus: Inevitably.

Socrates: Then both these conditions, riches and poverty, deteriorate the productions of the artisans, and the artisans themselves.

Adeimantus: So it appears.

Socrates: Then apparently we have found some other objects for the vigilance of our guardians, who must take every precaution that they may never evade their watch and steal into the city.

Adeimantus: What are these?

Socrates: Wealth and poverty; because the former produces luxury and idleness and innovation, and the latter meanness and bad workmanship as well as innovation.

Thus there can be no justice in a state in which one class of citizens have more than their normal needs require, and another class have less than their normal needs demand.

What is found in the state must be also found in the individual. For how could it enter the state, except through the individual members of the state? Hence we should expect to find in the individual man three principles, corresponding to the three classes of the state.

Two contradictory impulses, coexisting in the mind, cannot proceed from the same source. A thirsty man is often unwilling to drink. Hence there must be two principles within him—one prompting him, the other forbidding him to drink. The former proceeds from appetite or desire, the latter from reason. Hence we have at least two distinct elements in the soul—one rational, the other irrational, or appetitive. In the same way we find ourselves obliged to distinguish a third element, which is the seat of anger, spirit, resentment, and may be called the spirited, or passionate, or irascible element. When there is any division between the rational and the irrational principles, this third principle always arrays itself on the side of the former. Thus we have the rational, the spirited and the concupiscent element in the individual, corresponding to the Guardians, the Auxiliaries, and the productive class in the state. Hence, the individual is wise, in virtue of the wisdom of the rational

element; courageous, in virtue of the courage of the spirited element; temperate, when the rational element governs with the full consent of the other two; and, finally, just, when each of the three performs its own proper work, without meddling with that of the others.

Injustice, on the other hand, disturbs and confounds the functions of the three principles; and this destruction of their concord and harmony shows itself externally in a variety of criminal acts. Justice, then, is a kind of natural harmony, and healthy habit of mind; while injustice is a kind of unnatural discord and disease. And, if so, it is superfluous to inquire which of the two is the more profitable to the possessor.

COMMUNAL PROPERTY.

How can natural harmony, which can only accompany justice, be brought about? Not in a state where strife and enmity exist between wealth on one hand and poverty on the other. Natural harmony can only exist among friends, and, declares Socrates, "among friends everything is common property." This brought forth among other things the question of women.

Finally Adeimantus said:

We have an idea that you are lagging, and stealing a whole section, and that a very important one, out of the subject, in order to avoid handling it; and we suppose you fancied that we should not notice your passing it over with the very slight remark, that every one would see that the rule, "among friends every-

thing is common property," would apply to the women and children.

Socrates: Well, and was I not right, Adeimantus?

Adeimantus: Yes; but this word "right," like the rest, needs explanation. We must be told on what plan, among the many possible ones, this community of property is to be carried out. Do not therefore omit to tell us what plan you propose. For we have been long waiting in the expectation that you would specify the conditions under which children are to be begotten, and the manner of rearing them after they are born, and, in fact, you would give a complete description of the community of women and children intended by you; for we are of the opinion that the mode of carrying out this idea, according as it is right or wrong, will be a matter of great, or rather of vital importance, to a commonwealth. So, finding that you are taking in hand another form of government (that of communism in production and distribution), before you have satisfactorily settled these points, we have resolved not to let you go till you have discussed all these questions.

To this Socrates complies. The women, according to the idea of Socrates, are to be trained and educated as well as the men, in order to become useful citizens in the Republic. For women are just as capable as men. Like the man, woman displays marked ability for a variety of pursuits, the only difference being one of degree, not of kind, caused by the reason that woman is physically weaker than man.

Those women who show evidence of a turn for philosophy or war are to be associated with

the Guardians or Auxiliaries, are to share their duties, and become their wives. The connections, thus formed, are to be placed entirely under the control of the Magistrates, and the children are to be educated and cared for by the state. In this way the Guardians and Auxiliaries lose all sense of private property; they become conscious of a unity of interest among all classes.

Adeimantus, while admitting that in some ways such a society might prove desirable, asks Socrates to show whether, and to what extent, it could be made practicable. To this Socrates replies by telling Adeimantus that his purpose has been to outline an ideal commonwealth, in which there would be neither poverty or wealth, with the view of discovering the nature of justice. The possibility of realizing such a state in actual practice is a secondary consideration which does not affect the soundness of the method, or the actuality of the results. All that can be demanded of Socrates is to show how the imperfect conditions, as existing in society, may be most nearly brought into harmony with the ideal state.

To bring about this result, said Socrates, one fundamental change is necessary. The governing powers must be taken from rulers and politicians, and placed in the hands of true philosophers. The true philosopher is devotedly loyal to wisdom in all its branches. We must carefully distinguish between the genuine and the counterfeit lover of wisdom. The point of distinction lies in this, that the latter contents himself with the study of the variety of beautiful objects with which we are surrounded, while the former is never satisfied until he has penetrated to the essence of

Beauty in itself. The intellectual state of the former may be described as "opinion," while that of the latter is "knowledge," or "science." For we have two extremes; first, real existence, apprehended by science; and second, the negation of existence, or nonexistence, or ignorance. Intermediate between real existence and nonexistence stands phenomenal existence; and intermediate between science and ignorance stands opinion.

Opinion takes cognizance of phenomenal existence. Those who study real existence are lovers of wisdom, or philosophers; those who study phenomenal existence are lovers of opinion, not philosophers.

Glaucon asked: And whom do you call genuine philosophers?

Socrates: Those who love to see the truth.

Glaucon: In that you cannot be wrong; but will you explain what you mean?

Socrates: That would not be at all easy, with a different questioner; but you, I imagine, will make me the admission I require.

Glaucon: What is it?

Socrates: That since beauty is the opposite of ugliness, they are two distinct things.

Glaucon: Of course they are.

Socrates: Then since they are two, each of them taken separately is one.

Glaucon: That also is true.

Socrates: The same thing may be said likewise of justice and injustice, good and evil, and all general conceptions. Each of them in itself is one thing, but by the intermixture with actions and bodies and with one another, through which they are everywhere made visible, each appears to be many things. * * * Those who

love seeing and hearing, admire beautiful sounds and colors and forms, and all artistic products into which these enter, but the nature of beauty in itself their understanding is unable to behold and embrace are not philosophers. Those who are capable of reaching to the independent contemplation of abstract beauty, are true philosophers.

Thus, argues Socrates, we understand how to distinguish between genuine and counterfeit philosophers; and, obviously, the former should be made Guardians of a state. Those who understand beauty, also understand the highest ideals of humanity. Politicians who merely seek power know nothing of these ideals; and human society, alas, is governed by these politicians.

Socrates enumerates the characteristics of the true philosopher—the ones who should be selected to govern the ideal Republic. These characteristics are, (1) an eager desire for the knowledge of all real existence; (2) hatred of falsehood and love of truth; (3) contempt for the pleasures of the body; (4) indifference to money; (5) highmindedness and liberality; (6) justice and gentleness; (7) a quick apprehension, and a good memory; (8) a musical, regular, and harmonious disposition.

Adeimantus objects that, though he cannot deny the force of the arguments of Socrates, still, in practice, he finds that the students of philosophy generally become eccentric, and thereby socially useless.

That is very true, replied Socrates; but on whom are we to lay the blame of such a state of things? Not on philosophy, but on the degraded condition of the teachings and the politician of the day. For, under the present system of society, the genuine philosophic mind

is liable to be corrupted by a variety of adverse influences; and when those who might have proved genuine philosophers have been drawn away from the pursuit of philosophy, their place is supplied by brands of worthless and incompetent persons, who by their sophistry and absurdities bring philosophy into general disrepute. The few who continue steadfast in their allegiance to philosophy, resign politics in disgust, and are well content if they can escape the corrupting effect of contact with the world.

How can this evil be remedied? The state itself must regulate the study of philosophy, and must take care that the students pursue it on right principles, and at a right age. If a state is to be made a home for its citizens, it must be governed by philosophers. If such should ever take place (and why should it not?), the ideal state will be realized. As it is we are governed by mercenary adventurers, who teach nothing but the opinions of the multitude. As well might a person investigate the caprices and desires of some huge and powerful monster in his keeping, said Socrates, studying how it is to be approached, and how handled—at what times and under what circumstances it becomes most dangerous, or most gentle—on what occasions it is in the habit of uttering its various cries, and, further, what sounds uttered by another person soothe or exasperate it—and when he has mastered all these particulars, by long continued intercourse, as well he might call his results wisdom, systematize them into an art, and open a school, though in reality he is wholly ignorant which of those humors and desires is fair, and which foul, which good and which evil, which just and which unjust; and therefore is content to affix all these names to the fancies of the hu-

animal, calling what it likes good, and what it dislikes evil, without being able to render any other account of them—nay, giving the titles of “just” and “fair” to things done under compulsion, because he has not discerned himself, and therefore cannot point out to others, that wide distinction which really holds between the nature of the compulsory and the good. Tell me, in heaven’s name, asked Socrates of Adeimantus, do you not think that such a person would make a strange guide?

Adeimantus: Yes, I do think so.

Socrates: And do you think that there is any difference between such a person and the man who makes wisdom consist in having studied the whim and pleasures of the many-headed multitude, whether in painting, or in music, or finally in politics?

Then how shall we obtain just rulers? In youth and boyhood, said Socrates, they ought to be put through a course of training in philosophy, suited to their years; and while their bodies are growing up to manhood, especial attention should be paid to them, as a serviceable acquisition in the cause of philosophy. At the approach of that period, during which the mind begins to attain its maturity, the mental exercises ought to be rendered more severe. Finally, when their bodily powers begin to fail, and they are released from public duties and military service, from that time forward they ought to live a dedicated life, and consecrate themselves to this one pursuit, if they are to live happily on earth, and after death to crown the life they have led with a corresponding destiny in another world.

And what are the highest studies to be found? The highest of all is the study of “the Good,” whose possession is blindly desired by all men,

though they cannot give a clear account of its nature. Is it not plain, then, that the Guardians of the state must make a special study of this Good? For without it, how can they justly perform the duties of their office?

What is this Good, asks Adeimantus. Socrates admits that he cannot fully answer the question. He can only convey his conception of it by an analogy. In the world of sense we have the sun, the eye, visible objects; answering to which, we have in the intellectual world, the Good, Reason, the Forms or archetypes of visible objects, or, in the words of Socrates, Ideas. Or we may represent the same conception to ourselves, in this manner: There are two worlds—one visible, as seen by the eye; the other intellectual, as only perceived by the mind. Each world comprises two subdivisions, which, proceeding from the most uncertain to the certain, are, in the visible world. Images, i. e., shadows, reflections, etc.; Objects, i. e., all material things, whether animate or inanimate. In the intellectual world, Knowledge, attained by the aid of assumed premises on which all conclusions depend, and employing by way of illustration the second class of the visible world, e. g., Geometry; also Knowledge, in the investigation of which no material objects, but only the essential Forms are admitted, and in which hypotheses are used simply as a means of arriving at an absolute first principle, from which unerring conclusions may be deducted. Corresponding to these four classes, we have four mental states, which, again proceeding from the most uncertain, are, Conjecture, Belief, Understanding and Reason.

In the seventh book of the Republic Socrates, in order to understand the real import of such an education as he has outlined, offers as an illustration a number of persons chained from

their birth in a subterranean cavern, with their backs to the entrance of the cavern, and a fire burning behind them, between which and the prisoners runs a roadway, flanked by a wall high enough to conceal the persons who pass along the road, while it allows the shadows of things which they carry upon their heads to be thrown by the fire upon the wall of the cavern facing the prisoners, to whom these shadows will appear as the only realities. Now suppose that one of them has been unbound, and taken up to the light of day, and gradually habituated to the objects around him, till he has learned to really appreciate them. Such a man is to the unenlightened prisoners what an advanced philosopher is to the mass of backward, or half-educated, men and women. If he returns to the cavern, and resumes his former place and occupation, he will, at first, be the laughing stock of the others, just as the philosopher is the laughing stock, or is even hated, by the multitude. But once rehabilitated to the cavern, his knowledge of the objects which throw the shadows will enable him to advance beyond the prisoners who do not possess this knowledge. In the same manner the philosopher, when once habituated to intercourse with the world, will advance beyond the others in knowledge, justice and humanity. Therefore such should govern society.

Socrates, carrying the analogy still further, points that just as the whole body of the released prisoner was turned around in order to bring his eye to look in the right direction, so the purpose of education should be to turn the whole soul of man around, in order that the soul, or reason, may be directed rightly. Education does not generate or infuse a new principle; it only guides and directs a principle already in existence.

How is this revolution of the soul to be brought about? By the agency of such studies which tend to draw the mind from sensuous and selfish to the real and humane—from the visible and material to the invisible and eternal. Such studies as excite the mind to reflect upon the essential nature of the Universe will produce this result.

If Plato, the philosopher, were living today, how his soul would revolt at the false education of our schools, our press, and our pulpits!

In the eighth book of the Republic Socrates dwells upon the principal varieties of mental constitution and political organization. All conceivable politics may be reduced to five classes, represented by aristocracy, timocracy (a government of honor), oligarchy, democracy, and despotism. There are also five classes of human character, corresponding to the five classes of a state.

Everything that has had a beginning is subject to decay. Hence, in the course of time, diversions arise between the classes, and between the members of the classes themselves. The result is an understanding between the members of the higher classes, that they shall expropriate the wealth produced, and reduce the producers to slaves or serfs.

The lust of wealth grows till it transforms the state into an oligarchy, or the rulership of the rich. This lust, which pervades the governing body in an oligarchy, finally produces a dangerous class of poverty-stricken citizens, who appeal to arms and establish a democracy. Democracy in turn becomes reactionary, and prepares the way for despotism. The tyrannical man is the child of the democratical man—one in whom a single absorbing passion has

become predominant, and which absorbs all the lower appetites, pleasures and desires, and ministers to their gratification. Faithless, hypocritical, unjust, the tyrannical man becomes the ruling tyrant of the tyrannical state.

As state is to state in point of happiness or misery, so is man to man.

The soul of man contains three specific principles: The rational, or wisdom-loving, the spirited, or honor-loving, and the greedy, or gain-loving. There are three species of pleasures, corresponding to these three principles. The philosopher recognizes wisdom as the source of greatest pleasure; the ambitious man recognizes honor bestowed upon him; the sordid man recognizes money. Which of these three is right? Most obviously, says Socrates, the philosopher. The philosopher finds that wisdom, kindness and happiness are inseparable.

To everything there is a special vice by which, and by which alone, that thing can be destroyed. Thus, blindness destroys the eyesight, mildew destroys corn, and rot destroys timber. The vices that destroy the soul are injustice, intemperance, cowardice and ignorance.

Justice itself is the just man's best reward, and only a society founded on justice can find enduring happiness. Not only are love and honor the reward of the just man while he lives, but still greater rewards await him after he dies. To illustrate this Socrates narrates to Glaucon the fable of Er the son of Armenius:

THE FABLE OF THE ER.

I will tell you a tale, not like that of Odysseus to Alcinous, but of what once happened to a brave man, the son of Armenius, a native of Pamphylia, who, according to story, was killed

in battle. When the bodies of the slain were taken up ten days afterwards for burial in a state of decomposition, Er's body was found to be still fresh. He was carried home, and was on the point of being interred, when, on the twelfth day after his death, as he lay on the funeral-pyre, he came to life again, and then proceeded to describe what he had seen in the other world.

His story was, that when the soul had gone out of him, it traveled in company with many others till they came to a mysterious place, in which were two gaps, adjoining one another in the earth, and exactly opposite them two gaps above in the heaven. Between these gaps sat judges, who, after passing sentence, commanded the just to take the road to the right upwards through the heaven, and placed in front of them a symbol of the judgment that had been given; while the unjust were ordered to take the road downwards to the left, and also carried behind them evidence of all their evil deeds. When he came to the place himself, he was told that he would have to carry to men a report of the proceedings of that other world; and he was admonished to listen, and watch everything that went on there. So he looked, and beheld the souls on one side taking their departure at one of the gaps in the heaven and the corresponding gap in the earth, after judgment had been passed upon them; while at the other two gaps he saw them arriving, squalid and soiled, or pure and bright, according as they ascended from earth, or descended from heaven.

Each soul, as it arrived, wore a travel-stained appearance, and gladly went away into the meadow and there took up quarters, as people do when some great festival is pending. Greetings passed between all that were known to one another; and those who had descended

from heaven were questioned about heaven by those who had risen out of the earth; while the latter were questioned by the former about earth. Those who were come from earth told their tale with lamentations and tears, as they bethought them of all the dreadful things that they had seen and suffered in their subterranean journey, which they said had lasted a thousand years; while those who were come from heaven described enjoyments and sights of marvelous beauty. It would take a long time, Glaucon, to repeat at length the many particulars of their stories; but, according to Er, the main points were the following:

For everyone of all the crimes, and all the personal injuries committed by them, they suffered tenfold retribution. The cycle of punishment recommenced every hundred years, because the length of human life was estimated at a hundred years; the object being to make them pay the penalty for each offense ten times over. Thus, all who had been guilty of a number of murders, or who had betrayed and enslaved cities and armies, or who had been accomplices in any other villainy, were destined to undergo tenfold sufferings for all and each of their offenses; while, on the other hand, those who had done kindly acts, and had shown justice and righteousness, were destined to receive on the same principle their due reward. With regard to those whose death followed close upon their birth, he gave some particulars which need not be recorded. But, according to his narrative, the punishment for impiety, disobedience to parents, and the murder of near relatives, was unusually severe; and the reward for piety and obedience unusually great. For he was within hearing, he said, when one of the spirits asked where Ardiaëus the Great was.

Now this Ardiaeus had been sovereign in a city of Pamphylia, a thousand years before that time, and was said to have put his aged father and elder brother to death, besides committing other wicked deeds. The spirit to whom the question was addressed, replied.

"He is not come, and is not likely to come hither. For this, you must know, was one of the terrible sights that we beheld. When we were close to the aperture, and were on the point of ascending, after having undergone all our other sufferings, we suddenly came in sight of Ardiaeus and others, of whom the greater part had been despots; though it is true there were also a few private persons, who had once been enormous criminals. These people, when they thought themselves sure of ascending immediately, were repulsed by the aperture, which belled whenever one of these incurable sinners, or anybody who had not fully expiated his crimes, attempted to ascend. Thereupon certain fierce and fiery-looking men, who were in attendance and understood the meaning of the sound, seized some of them and carried them off; but Ardiaeus and others were bound hand and foot and head, and thrown down and flayed with scourges, and dragged out by the wayside, and carded like wool upon thorn-brushes; and those who were passing by at the time were informed why they were put to this torture, and that they were being carried away in order to be flung into Tartarus. We had already gone through a great variety of alarms, but none of them were equal to the terror that then seized us, lest that bellowing should be uttered when any of us tried to go up; and most glad we all were to ascend, when it was not heard."

This will convey an idea of the penalties and the tortures; while the rewards were precisely the opposite.

When seven days had elapsed since the arrival of the spirits in the meadows, they were compelled to leave the place, and set out on the eighth day, and travel three days, till they arrived on the fourth at a place, from whence they looked down upon a straight pillar of light, stretching across the whole heaven and earth, more like the rainbow than anything else, only brighter and clearer. This they reached when they had gone forward a day's journey; and, arriving at the center of the light, they saw that its extremities were fastened by chains to the sky. For this light binds the sky together, like the hawser that strengthens a trireme, and thus holds together the whole revolving universe.* To the extremities is fastened the distaff of Necessity, by which all the revolutions of the universe are kept up. The shaft and hook of this distaff are made of steel; the whole is a compound of steel and other materials. The nature of the whorl may be thus described: In shape it is like an ordinary whorl; but from Er's account we must picture it to ourselves under the form of a large hollow whorl, scooped out right through, into which a similar but smaller whorl is nicely inserted, like boxes which fit into one another. In the same way a third whorl is inserted within the second, a fourth within the third, and so one to four more. For in all there are eight whorls inserted into one another, each concentric circle showing its rim above the next outer, and all together forming one solid whorl embracing the shaft, which is passed through the center of the eighth. The first and outermost whorl has the broadest rim; the sixth has the next broadest; then comes the fourth; then the eighth;

*In Greek astronomy, like that of the Bible, the sky was supposed to be a solid transparent vault in which the stars were fixed.

then the seventh; then the fifth; then the third; and the second has the narrowest rim.

The rim of the greatest whorl exhibits a variety of colors; that of the seventh is most brilliant; that of the eighth derives its colors from the reflected light of the seventh; that of the second and that of the fifth are similar, but of a deeper color than the others; the third has the palest color; the fourth is rather red; and the sixth is almost as pale as the third.

Now the distaff as a whole spins round with uniform velocity; but, while the whole revolves, the seven inner circles travel slowly round in the opposite direction, and of them the eighth moves quickest, and after it the seventh, sixth and fifth, which revolve together; the fourth, as it appeared to them, completes its revolution with a velocity inferior to the last mentioned; the third ranks fourth in speed; and the second fifth.*

The distaff spins round upon the knees of Necessity. Upon each of its circles stands a siren, who travels round with the circle, uttering one note in one tone; and from all the eight notes there results a single harmony. At equal distances around sit three other personages, each on a throne. These are the daughters of Necessity, the Fates—Lachesis, Clotho and Atropos; who, clothed in white robes, with gar-

**This is a description of the first observed phenomena of astronomy. The motion of the whole distaff represents the apparent diurnal revolution of the heaven around the earth as center of the system. The seven innermost whorls, with their independent motions, represent respectively the orbits of Saturn, Jupiter, Mars, Venus, Mercury, the Sun and the Moon. The outermost whorl with its "variety of colors," represents the fixed stars.*

lands on their heads, chant to the music of the sirens; Lachesis the events of the past; Clotho those of the present; Atropos those of the future.

Clotho with her right hand takes hold of the outermost rim of the distaff, and at intervals twirls it altogether; and Atropos with her left hand twirls the inner circles in like manner; while Lachesis takes hold of each in turn with either hand.

Now the souls, immediately on their arrival, were required to go to Lachesis. An Interpreter first of all marshalled them in order, and then having taken from the lap of Lachesis a number of lots and plans of life, mounted a high platform and spoke as follows:

"Thus saith the Maiden Lachesis, the daughter of Necessity: 'Ye short-lived souls, a new generation of men shall here begin the cycle of its mortal existence. Your destiny shall not be allotted to you, but you shall choose it for yourselves. Let him who draws the first lot be the first to choose a life, which shall be his irrevocably. Virtue owns no master; he who honors her shall have more of her, and he who slights her, less. The responsibility lies with the chooser. Heaven is guiltless.' "

Having thus spoken, he threw the lots down upon the souls, and each soul took up the one which fell by his side, except Er himself, who was forbidden to do so. Each, as he took up his lot, saw what number he had drawn. This done, the plans of life, which far outnumbered the souls that were present, were laid before them.

They were of every kind. There were lives of all living creatures, and among them every sort of human life. They included sovereignties, of which some were permanent, while others were

abruptly terminated and ended in poverty and exile. There were lives of famous men, renowned for beauty of person, for bodily strength, or for high birth and the merits of ancestors; and likewise there were lives of undistinguished men, of celebrated and uncelebrated women. But no settled character of soul was included in them, because with the change of life the soul also becomes changed. But in every other respect the materials were variously combined—wealth appearing here, and poverty there; disease here, and health there; and here again a mean between these extremes.

This, my dear Glaucon, is apparently the moment when everything is at stake with a man; and for this reason, above all others, it is the duty of each of us to diligently investigate and study, to the neglect of every other subject, that science which may haply enable a man to discover who will so instruct him that he will be able to discriminate between a good and evil life, and, according to his means, to choose, always and everywhere, that better life, by carefully calculating the influence of the things just told in combination or in separation, may have upon the real excellence of life; and who will teach him to understand what evil or good is wrought by beauty tempered with poverty or wealth, and how the result is affected by the state of soul which enters into the combination; and what is the consequence of blending together such ingredients as high or humble birth, private or public life, bodily strength or weakness, readiness or slowness of apprehension, and everything else of the kind, whether naturally belonging to the soul or accidentally acquired by it; so as to be able to form a judgment from all these data combined, and, with an eye steadily fixed on the nature of the soul, to choose between the good and the evil life,

giving the name of evil to the life which will draw the soul into becoming more unjust, and the name of good to the life which will lead it to become more just, and bidding farewell to every other consideration of life.

For we have seen that in life and in death it is best to choose thus. With iron resolution must he hold fast this opinion when he enters the future world, in order that there as well as here he may escape being dazzled by wealth and like evils; and may not plunge into usurpations or other similar courses of action, to the inevitable hurt of other people, and to his own still heavier hurt; but may know how to choose that life which always steers a middle course between extremes, and to shun excess, not only in this life, but also in that which is to come. For only by acting thus can he become a happy soul.

To return; the messenger from the other world reported that the Interpreter spoke to this effect:

"Even the last comer, if he chooses with discretion, and lives wisely, will find in store for him a life that is anything but unhappy, with which he may well be content. Let not the first choose carelessly, or the last despond."

As soon as he had said these words the one who had drawn the first lot advanced, and chose the most absolute despotism he could find; but so thoughtless was he, and so greedy, that he had not carefully examined every point before making his choice; so that he failed to note that he was fated therein, amongst other calamities, to devour his own children. Therefore, when he had studied it at leisure, he began to beat his breast and bewail his choice; and, disregarding the admonitions of the Interpreter, he laid the blame of his misfortune, not

upon himself for choosing the life of an oppressor of mankind, but upon Fortune and Destiny, and upon anybody save himself.

He was one of those who had come from heaven and had lived during his former life under well-ordered conditions, and hence a measure of virtue had fallen to his share through the influence of habit, unaided by any philosophy. Indeed, according to Er's account, more than half the souls similarly deluded,—i. e., greedy for earthly power—had come from heaven; which is to be explained by the fact of their never having been disciplined through experience. For the majority of those who came from earth did not make their choice in this careless manner, because they had known sorrow themselves, and had seen it in others.

If a man were always to carefully study wisdom, whenever he entered upon his career on earth, and if it fell to his lot to choose anywhere but among the very last, there is every reason, to judge by the account brought from the other world, that he would not only be happy while on earth, but also that he would travel from the world to the other and back again, not along a rough and subterranean, but along, a smooth and heavenly road.

It was a truly wonderful sight, he said, to watch how each soul selected its life; a sight at once melancholy, and ludicrous, and strange. The experience of their former life guided the choice. Thus he saw the soul, which had once been that of Orpheus, choosing the life of a swan, because from having been put to death by women he detested the whole race so much that he would not consent to be conceived and born of a woman. And he saw the soul of Thamyras choosing the life of a nightingale.

He saw also the soul of a swan changing its nature, and selecting the life of a man; and its example was followed by other musical creatures.

The soul that drew the twentieth lot chose a lion's life; it was the soul of Ajax, the son of Telamon, who shrunk from becoming a man because he recollected the decision respecting the arms of Achilles. He was followed by the soul of Agamemnon, who had also been taught by his sufferings to hate mankind so bitterly that he adopted in exchange an eagle's life. The soul of Atalanta, which had drawn one of the middle lots, beholding the great honors attached to the life of an athlete, could not resist the temptation to become one. Then he saw the soul of Epeus the son of Panopeus assuming the character of a skilful work-woman. And in the distance, among the last, he saw the soul of Thersites the buffoon choose the life of an ape.

It so happened that the soul of Odysseus had drawn the last lot of all. When he came to choose the memories of his former sufferings had so softened his ambition that he went about a long time looking for a quiet, retired life; which at last, with much trouble, he discovered lying about, and which had been contemptuously cast aside by the others. As soon as he found it he chose it gladly, and said that he would have done so even if he had drawn the first lot. And likewise some of the various animals passed into men, as well as into one another; the unjust passing into the wild, and the just into the tame; and every kind of mixture ensued.

Now, when all the souls had chosen their lives in the order of their lots, they advanced in their turn to Lachesis, the daughter of Ne-

cessity, who dispatched with each of them the Destiny he had selected to guard his life and satisfy his choice. Thus Destiny first led the soul to Clotho in such a way as to pass beneath her hand and the whirling motion of the distaff, and so ratified the fate which each had chosen in the order of precedence. After touching her, Destiny next led the soul to the spinning of Atropos, and thus rendered the mandate of Clotho irreversible. From thence the souls passed straightforward under the throne of Necessity. When the rest had passed under it, Er himself also passed under; and they all traveled into the Plain of Forgetfulness, through fierce and suffocating heat. As the evening came on they took their quarters by the bank of the River of Indifference, whose waters cannot be held in any vessel. All are compelled to drink a certain quantity of the water; but those who are not guided by prudence drink more than the quantity insisted upon; and each, as he drinks, forgets everything. When they had gone to rest, and it had become midnight, there was a clap of thunder and an earthquake; and in a moment the souls were carried to their new birth, this way and that, like shooting stars.

Er himself was prevented from drinking of the water; but how, and by what road, he reached his body again, he knew not; only he knew that suddenly he opened his eyes at dawn, and found himself laid out upon the funeral pyre.

And thus, Glaucon, the tale was preserved; and it may also preserve us, if we will listen to its warnings; in which case we shall pass safely across the River of Lethe, and not defile our souls. Indeed, if we follow my advice, believing the soul to be immortal, and to pos-

sess the power of entertaining all evil, as well as all good, we shall ever hold fast the upward road, and devotedly cultivate justice combined with wisdom, in order that we may be loved by one another, and by the gods, not only during our stay on earth, but also when, like conquerors in the games collecting the prizes of their admirers, we receive the prizes of virtue; and, in order that both in this life and during the journey of a thousand years, our souls may never cease to prosper.

Other Titles in Pocket Series

Drama

- 46 Salome. Oscar Wilde.
- 80 Pillars of Society. Ibsen.
- 131 Redemption. Tolstoi.
- 99 Tartuffe. Moliere.
- 54 Importance of Being Earnest. Oscar Wilde.
- 81 Pelleas and Melisande. Maeterlinck.
- 8 Lady Windermere's Fan. Oscar Wilde.
- 226 Prof. Bernhardt. Schnitzler.

Fiction

- 6 De Maupassant's Stories.
- 15 Balzac's Stories.
- 178 One of Cleopatra's Nights. Gautier.
- 58 Boccaccio's Stories.
- 45 Tolstoi's Stories.
- 12 Poe's Tales.
- 145 Great Ghost Stories.
- 21 Carmen. Merimee.
- 38 Dr. Jekyll and Mr. Hyde.

PROSTITUTION IN THE UNITED STATES

HISTORICAL INTRODUCTION

Prostitution does not flourish under very primitive conditions, and it is a feature of crowded city life rather than of pastoral or agricultural simplicity. It has, however, been called the first profession to arise upon the earth; and there is a story in Genesis which shows that harlots were familiar to the simple shepherds of Palestine, and that a kid was considered a fair fee.

In the first North American settlements, there was little prostitution. This is not to say that the pioneers were unusually chaste. We sometimes think of the Puritans as men and women of unmingled godliness. As a matter of fact, the ban they put on a long list of harmless amusements tended to make sex the most common form of recreation with them. In the colonies south of New England, the pursuit of joy was not banned, but it took some time before theaters and other amusement places were available. Fornication and adultery were common, then, in all the provinces. The Puritans dealt more severely with them, fining, flogging, imprisoning, exposing to public shame, or putting to death sexual offenders who were unfortunate enough to be caught. Since they lived in small towns, it was for a long time

PROSTITUTION IN

difficult for prostitutes to arise. We know, however, that many women had relations with men to whom they were not married. Private morality cannot, in the nature of things, be appraised statistically, and we do not have any record of the callers the cold Puritan lady received while her husband was out hunting or planting corn. Adulterers were discovered often enough to show that there were many of them. After a time, too, we find special penalties provided for "night walkers."

Southern colonies were less strict. What the Cavaliers thought of peccadilloes may be inferred from the Restoration comedies of England, while the Puritan attitude is to be found in Hawthorne's *The Scarlet Letter*. Moreover, social inequality quickly became the rule from New Netherland (or New York) south. The slaves and servants, both black and white, were practically without liberty of choice in sexual matters. The attractive women among them usually became concubines to their masters.

The African slaves were brought from savage or barbarous jungle regions and forced to adjust themselves to the whims of white men with strange ways. Their first and chief duty was obedience. As for chastity and reputation, a learned Southern jurist was afterward to declare explicitly that they had no meaning with regard to a Negress. A colored man might be married to a woman of his own race, but he had no way of remaining with her if the two were separately sold. The owner could take any of his slave women to himself. If any child was born in this way, it was a slave. The

color of the average Negro in the United States has grown much lighter since 1700.

For white servants, who were mostly slaves over a specified term of years, the conditions were not much different. It was provided by law that a female servant who gave birth to an illegitimate child should be bound to her master for an additional period, and that the child should also be an indentured servant until reaching its majority. Evidently, such legislation was intended to improve public morality and to repay the master for loss of work during and after pregnancy. But it was quickly seen that it made lust profitable. The illegitimate children did not cost very much to raise until they were five or six years old, when they were put to work. Many masters were therefore encouraged to have relations with their female servants.

Frederick Douglass tells of a poor Maryland farmer in the nineteenth century who could only afford to buy a single slave. He chose a healthy young Negress, upon whom he depended as a breeder. He was himself a good Christian—which meant that he knew how to embellish his floggings with Biblical texts—and perhaps too dainty to be with the woman himself. He used, however, to lock a white hired man in with the Negress. When twins were born of their union, the woman's master was well pleased. The price of a Negro in the middle of the century was far greater than that of a cow or a horse, and slave-breeding became an important industry in the northern tier of slave states.

The Negress who becomes a white man's mistress does not, except in the most unusual instances, lose caste among her own people. It is better, of course, to be his wife, but this is forbidden in a number of states. In addition to the moral standards imposed on the colored people during the period of slavery, present economic conditions favor laxity. The Negro is excluded from most of the skilled trades, or at least from the unions. He is seldom able to provide a wife and children with even the ordinary comforts of life, let alone the luxuries. Though he be industrious himself, his wife may be reduced to washing clothes and cleaning houses for other people. The attractive young white woman expects to find a husband who is willing and able to support her according to the standards of her parents, or perhaps somewhat higher ones. For the pretty colored girl, this may be a vain hope.

Of the early settlers of our country, the French who came to Louisiana were most familiar with legalized prostitution and most tolerant of it. It is true that there were numerous attempts during the early period to suppress the brothels of France, but they were not very successful. The police were authorized, though, to punish prostitutes as such or because of their disorderly conduct. In the seventeenth and eighteenth centuries, many women were exiled to the colonies, especially to Madagascar, to Canada, and to Louisiana. In *Manon Lescaut*, the unfortunate heroine is sent across the Atlantic. Some of the expatriated women became respectable wives, and

their children enjoy the aristocracy which inheres in the Creole families. Others resumed their profession in America.

Both in the French and English colonies, many of the servants were convicts, exiled after they had served their sentences or permitted to escape the penalties of their crimes on condition that they should go to the New World. Into Georgia were sent many debtors and other persons who had made failures of their lives in England. The "black sheep" was found in all the American provinces, as he is today to be encountered in the colonies and in China. We may reasonably infer, then, that morality was not unusually high in America before the Revolution. And though our laws demand something very close to Puritan perfection, delinquency of all sorts is still much commoner than it is in Europe.

The emigrant is, in general, more active and energetic and keen than his neighbor who remains at home. Also he is less scrupulous, less concerned with the value of tradition and custom and law, more individualistic. America, the land of transplanted people, has been the country of the old Puritans. It is now, to a far greater extent, the home of the New Puritanism. The chief element in these creeds is the consciousness of sin. It is interesting to speculate that this may be widespread in America because sinfulness, according to the usual standards, also is. The charge has been made that the countries where prudery is strongest—especially those where English is spoken—house the most lustful people. And the land

of Prohibition, it may be said, has more drunkenness than a good many countries whose inhabitants may boldly ask for beer, wine, rum, gin, whiskey or cognac.

The United States is no longer a new country. Only in a few frontier districts and in recently-built mining camps do the men greatly outnumber the women. Such a condition, which was long characteristic of the whole continent, encourages promiscuity in its least attractive forms. When a pioneer community "gets religion," the sudden accession of goodness commonly leads to violent measures against harlots and gamblers. Right now, America appears to have surrendered to the Salvation Army and its Baptist and Methodist allies. Perhaps our children will see the reaction, but the country is now given over to the repenters and those persons who are providing themselves with evil deeds to repent later.

The example of America has infected Europe, too. Our prosperity and efficiency are supposed to be due in part to our puritanical laws. As these are not very well obeyed, it is difficult to see how they have much to do with the matter. Prostitution can be suppressed, or at least reduced to a minimum, but only at the expense of the "virtue" of the masses of women of a community. This fact, added to the power of money to make law-enforcing officials temporarily blind, explains why our police often neglect to close brothels and to arrest harlots, although the statute obligates them to do so. The same thing is true of some foreign countries, but the United States probably leads

the world in the enactment of laws whose chief office it is to make additional work for the government printers.

With regard to sexual relations, the legislation varies from state to state. What is licit under one jurisdiction may be punishable with long imprisonment a few miles away. It may be noticed that fornication is not an offense under American common law or the British common law, and that it is criminal only by an express statutory provision. Prostitution is not authorized by law anywhere in the United States, but the definition, the penalties, and the attitude of the police and the courts are by no means identical everywhere. It is said that solicitation on the streets is a common law offense, and it would be forbidden in any state where the courts accept this view and the common law is still in force aside from any local legislation against it. For a fuller discussion of the legal conditions with regard to all these offenses, the reader is referred to Little Blue Book No. 1148, *Sexual Crimes and American Law*, by Clement Wood.

In dealing with prostitution, we must not forget the human needs it serves. It is not merely a blot on an abstract thing called the community, as reformers sometimes appear to assume in their speeches and writings. Perhaps it is not altogether an unmixed evil, either, although it is objectionable esthetically and hygienically.

Benjamin Franklin tells in his *Autobiography* how he wanted to marry a girl of Philadelphia, but required a dowry of about a hundred

pounds, or enough to pay the remaining debts on his printing machinery. He was refused, perhaps in order that he should elope with his beloved, after which a smaller payment would necessarily content him. "But this affair having turned my thoughts to marriage," he says, "I look'd round me and made overtures of acquaintance in other places; but soon found that, the business of a printer being generally thought a poor one, I was not to expect money with a wife, unless with such a one as I should not otherwise think agreeable. In the meantime, this hard-to-be-governed passion of youth hurried me frequently into intrigues with low women that fell in my way, which were attended with some expense and great inconvenience, besides a continual risque to my health by a distemper which of all things I dreaded, though by great good luck I escaped it."

Franklin, who was born in 1706, married in 1730. He was not a libertine, but rather a lover of thrift and order, even something of a Puritan. It is curious to find him objecting to the cost of prostitution, for that of supporting a wife was certain to be more. He hoped for a time, as we have seen, though, that his spouse would help him to pay his debts. The distemper which he feared, that is, syphilis, has been the enemy of prostitution everywhere in modern times—a worse foe, surely, than restrictive and prohibitory legislation. I have not introduced Franklin here for the purpose of taking away any of his greatness, for I am certain that many more of our heroes have had

relations with prostitutes. Not all men are equally frank, and no one is under any compulsion to inform posterity about his private behavior. Under the list of virtues which he prepared for himself, Franklin included:

"CHASTITY

"Rarely use venery but for health or offspring, never to dulness, weakness, or the injury of your own or another's peace or reputation."

Most American action against the prostitute is recent. For many years, no serious attempt was made to abolish or to regulate her profession. The World War caused a great deal of puritanical commotion: the soldier who was going to make the world safe for democracy was first of all to be rendered safe for heaven.

NEW YORK IN 1855

When A. J. B. Parent-Duchatelet published his masterly work about prostitution in Paris in 1836, he inspired a number of other investigators to issue reports about the cities with which they were most familiar. Monographs on prostitution in London, Edinburgh, Lisbon, Lyons, Algiers, and Berlin quickly followed. Dr. William M. Sanger's *The History of Prostitution: Its Extent, Causes, and Effects Throughout the World*, first appeared in 1859. The most valuable part of Sanger's book is devoted to a study of conditions in New York, which he himself made in 1855. He became resident physician of Blackwell's Island in 1853. Two years later, the Board of Governors in charge of the charitable and penal institutions of the city asked him to make a study of syphilis in the various houses on Blackwell's Island and to say what plan, in his opinion, "could be adopted to relieve New York City of the enormous amount of misery and expense caused by syphilis."

Sanger then asked Mayor Wood and the chief and captains of police to help him gather information about prostitution in the city. Prohibitory laws existed, but they were not enforced, although an attempt to put them into effect had been somewhat weakly made shortly before. In Sanger's words: "This vice is attaining a position and extent in this community which cannot be viewed without alarm.

It has more than kept pace with the growth of our city. Unlike the vice of a few years since, it no longer confines itself to secrecy and darkness, but boldly strides through our most thronged and elegant thoroughfares, and there, in the broad light of the sun, it jostles the pure, the virtuous, and the good. It is in your gay streets, and in your quiet, home-like streets; it is in your squares, and in your suburban retreats and summer resorts; it is in your theatres, your operas, your hotels; nay, it is even intruding itself into your private circles, and slowly but steadily extending its poison, known but to few and entirely unsuspected by the majority of our citizens. The whole machinery of the law has been turned against these females without success; its only result having been a resolve on their part to confront society with the charge of harsh, cruel and unjust treatment."

Two thousand women were asked to answer a number of questions about themselves and the conditions which had led them to become prostitutes. In age, they ranged from 15 to 77, the greater part of them being between 18 and 25. Seven-eighths of the women studied were under 30. Of the older ones, most were keepers of brothels rather than active harlots. Sanger tells us—the marks of emphasis are his own—that "*The average duration of life among these women does not exceed four years from the beginning of their career!*" I think this was a great exaggeration. As a physician on Blackwells' Island, he was most familiar with the seriously diseased prostitutes.

The number of women born abroad was 1,238, as compared with 762 born in the United States, 394 of them in the state of New York. It appeared that the native-born from other states came chiefly from manufacturing districts. Of the foreign-born, 706 had immigrated from Ireland, 255 from Germany, and 104 from England. As to the British dominions, Sanger says: "The ratio in which the several parts of that kingdom supply the New World with courtesans may be stated in round numbers as follows: Ireland contributes one prostitute to every four thousand of her population; Scotland, one prostitute to every sixteen thousand of population; England and Wales, one prostitute to every fifty thousand of population." According to the illegitimacy statistics in the British Isles, Ireland was far more chaste than England or Scotland. I have already suggested, in writing about concubinage, that the Irish figures at home have probably been inaccurate. The young Irish women who were coming to America in large numbers in the middle of the last century were mostly poor and ignorant. The German immigration was also great in the years that followed 1848. Of the foreign women, many had been resident in the country for only a year or two, or even less. Although Sanger does not mention the fact here, it is undoubtedly true that a considerable proportion of the foreign-born prostitutes in New York in the 1850's and for some time later were brought into the country for the purpose of engaging in the traffic. The women said for the most part

they had come to America to improve their condition or because their relatives were already in the United States or brought them across the Atlantic. Only one-fifth had paid for their own passage, or claimed that they had done so. There were 28 who admitted that their seducers had paid for their passage, and 9 whom public authorities had assisted, presumably to rid their own countries of undesirable persons; 905 said that they had been helped by relatives and friends. What the basis of the friendship was, the statistics do not disclose.

As to their education, 714 claimed to be able to read and write "well" and 546 "imperfectly," while 219 could not read, and 521 were illiterate. The native-born prostitutes were, on the whole, better-educated than those of foreign origin. Education was not at this time compulsory in New York. Those who read and wrote "well," as Sanger says, meant that they could read a page or two of print without much trouble and were able to sign their names.

There were 1,216 single women, 490 married ones, and 294 widows. It appears that there were no divorcees. Of the married women, 71 were living with their husbands. The others had been deserted by their husbands or had left them because of ill-treatment, real or alleged. Of the single women, thirty per cent had one or more children, and the percentages were 73 and 79 in the case of married women and widows. One single woman had borne ten children, and two had given birth to six each. One of the married women had borne

15. It is impossible to tell whether the children born out of wedlock were begotten in a period of concubinage or of genuine prostitution.

Of the 2,000 courtesans questioned under Sanger's directions, 821 admitted that they had suffered from gonorrhea, syphilis, or, in 36 instances, from both. The actual number who had been or were venereally diseased was no doubt considerably higher.

To the question, "What was the cause of your becoming a prostitute?" the replies were as follows:

Causes	Numbers
Inclination	513
Destitution	525
Seduced and abandoned.....	258
Drink, and the desire to drink.....	181
Ill-treatment of parents, relatives or husbands	164
As an easy life.....	124
Bad company	84
Persuaded by prostitutes.....	71
Too idle to work.....	29
Violated	27
Seduced on board emigrant ships.....	16
Seduced in emigrant (immigrant) boarding houses	8
Total	2,000

It is interesting and important to observe that over a fourth of the number admitted that inclination, not poverty or seduction, had made prostitutes of them. We can be sure that the number was really much greater than this, although we must remember that motives are mixed. The wealthy nymphomaniac may indulge her lust without becoming a courtesan.

The young woman who is poor, lustful, and attractive is likely to find in prostitution some sort of satisfaction for her principal wants.

Sanger represents the usual tone of the last century—one that has not yet entirely disappeared—when he says: "If their representations were borne out by facts, it would make the task of grappling with the vice a most arduous one, and afford very slight grounds to hope for any amelioration; but it is imagined that the circumstances which induced the ruin of most of those who gave the answer will prove that, if a positive inclination to vice was the proximate cause of the fall, it was but the result of other and controlling influences. In itself such an answer would imply an innate depravity, a want of true womanly feeling, which is actually incredible. The force of desire can neither be denied nor disputed, but still in the bosoms of most females that force exists in a slumbering state until aroused by some outside influences. No woman can understand its power until some positive cause of excitement exists. What is sufficient to awaken the dormant passion is a question that admits innumerable answers. Acquaintance with the opposite sex, particularly if extended so far as to become a reciprocal affection, will tend to this; so will the companionship of females who have yielded to its power; and so will the excitement of intoxication. But it must be repeated, and most decidedly, that without these or some equally stimulating cause, the full force of desire is seldom known to a virtuous woman. In the male sex nature

has provided a more susceptible organization than in females, apparently with the beneficent design of repressing those evils which must result from mutual appetite equally felt by both. In other words, man is the *aggressive* animal, so far as desire is involved. Were it otherwise, and the passions in both sexes equal, illegitimacy and prostitution would be far more rife in our midst than at present."

Queen Victoria was in her kitchen, eating bread and honey; and the good little girls, on both sides of the Atlantic, were very, very good. Strange to say, this Blackwell's Island physician, who should have seen the truth clearly, chose rather to look at a fairy tale about the lack of sexual desires in "virtuous" women. We have not yet given up the strange notion that the man invariably seduces the woman, never the woman the man, and that this is due to inherent differences between them. Sanger is altogether misleading when he remarks, "Undoubtedly there are cases where the woman is the seducer, but these are so rare as to be hardly worth mentioning."

He complains that many obscene books and prints were being sold in New York: "Boys and young men may be found loitering at all hours round hotels, steamboat docks, railroad depots, and other places, ostensibly selling newspapers or pamphlets, but secretly offering vile, lecherous publications to those who are likely to be customers. . . . The venders have a trick which they frequently perform, and which can scarcely be regretted. In a small bound volume they insert about half a dozen

highly-colored obscene plates, which are cut to fit the size of the printed page. Having fixed upon a victim, they cautiously draw his attention to the pictures by rapidly turning over the leaves, but they do not allow him to take the book into his hands, although they give him a good opportunity to note its binding. He never dreams that the plates are loose, and feels sure that in buying the book he buys the pictures also. When the price is agreed upon, the salesman hints that, as he is being watched, the customer had better turn his back for a moment while taking the money from his pocket-book, and in this interval he slips the plates from between the leaves and conceals them. The next moment the parties are again face to face, the price handed over, and the book he has seen before is handed to the purchaser under a renewed caution, and is carefully pocketed. The book-seller leaves, and at the first opportunity the prize is covertly drawn forth to be examined more minutely, and the unwary one finds that he has paid several dollars for some few printed pages, without pictures, which would have been dear at as many cents."

Not all purchasers were so unfortunate. Some were able to get the desired prints, or to obtain books which the police considered indecent. There were, too, "voluptuous novels," chiefly translations from the French, "with wood-cuts which approach lasciviousness as nearly as possible without being indictable." Sanger asserts that "there can be but one opinion as to the share obscene and voluptuous

books have in ruining the character of the young, and they may justly be considered as causes, indirect it may be, of prostitution." Many later writers blame the moving pictures, but in the 1850's the yellow-backed pamphlets were supposed to be at the root of all evil. As though men and women did not make love and kiss and embrace before there were any books! As though adultery and fornication came into existence after there were pageants and plays glorifying sex! Are the illiterate more chaste than the literate? I think, rather, that if books and plays and pictures are harmful sexually, it is in substituting incomplete and unsatisfactory gratifications for the proper ones. The reader may try to content himself with descriptions instead of with persons of the opposite sex. The "indecent" publications reduce illicit intercourse, in all probability, instead of adding to it. But they make small difference of any kind.

Of the 2,000 prostitutes whom Sanger's assistants questioned, 302 declared that they had means of support other than the fees received from patrons, while the rest were dependent on these for their livelihood. Nearly half, or 933, had been servants before becoming courtezans, and the next largest number, 499, claimed to have lived with parents or friends until adopting the calling. The remainder had been engaged in a variety of occupations. One woman said she had been an artist, another had been a hospital nurse, three had taught school, a considerable number had been engaged in factories and workshops. The average wage which

these women had received was very low, less than four dollars a week. The cost of living was indeed very low in 1855, and many of the girls had lived at home. It was, in most cases, the desire for luxuries rather than the inability to gain simple food and shelter which turned them to prostitution; and strong sexual feeling was surely present in a large part of the cases. For this we have the testimony of the women themselves, as already noticed.

"What business did your father follow?" was one of the questions asked. Farmers led, with 440. Next followed laborers, with 259, and carpenters, with 139. Only one was reported as a brothel-keeper. There were six clergymen among them, 13 lawyers, 19 physicians, five men of property, and 31 naval officers—more than the liquor dealers, who numbered 22. It is clear that the women came from all social classes, and it appears that poor people did not contribute more than their proportionate share.

Three hundred and fifty-nine of the girls said that they drank no intoxicating liquors, while 647 declared that they drank moderately, 754 admitted that they were intemperate drinkers, and 240 were willing to describe themselves as habitual drunkards. It is apparent that drinking was very common among the New York prostitutes of the last century. The courtesan is usually addicted to intoxicants, as also to cigarettes and, in many cases, to narcotic drugs. Sanger tells us that the quality of the gin, rum, brandy, whiskey, and wine sold in the cheaper brothels was very bad.

The religious statistics are as follows:

"Were your parents Protestants, Catholics, or non-professors?"

Religion	Numbers
Protestants	960
Catholics	977
Non-professors (atheists, agnostics, etc.)	63

"Were you trained to any religion? If so, was it Protestant or Catholic?"

Religion	Numbers
Protestants	972
Roman Catholics	977
No religious training.....	51

"Do you profess the same religion now?"

Profession	Numbers
Profess religion as educated.....	1909
Non-professors	91

It is certainly impossible to argue from such figures as these that religious training prevents prostitution. The parents of these women were brought up, for the most part, at a time when religious doubt was very strong in the United States. And though the harlots came to a large extent from pious communities of Ireland and Germany, we may fairly infer that the proportion of unbelievers among them and their parents was considerably lower than it was for the people of their native places as a whole.

Brothels of the first class were known as "Parlor Houses." The women who lived in them very seldom went out in search of patrons. They were almost always young and attractive, and they could count on receiving enough visitors without making a display of

themselves on the street. It was well enough for them to walk up the fashionable' side of Broadway in the afternoon, or to go for a carriage ride with their visitors, or to be seen in the theatres; but they found it best not to be noisy or conspicuous.

The Parlor Houses were expensively furnished, and the guests who were received there had to pay what were for those days very high prices. Champagne was furnished at three dollars a bottle, and it was customary for visitors to treat all the girls in the house. Most of the Parlor House prostitutes were American-born. "Some of them," Sanger says, "are very well educated; accomplished musicians and artists are sometimes found among them, while others aspire to literature." Most of them received as much as fifty dollars a week from their patrons, but they did not, as a class, save much money. Yet we are told of one young woman who accumulated seven thousand dollars in a few years of prostitution. It was a little fortune, equivalent, say, to fifty thousand dollars in our time.

A large number of the first-class courtesans were living in private lodgings, where they could save more for themselves than in the Parlor Houses. The brothel-keepers received about fourteen dollars a week for board and lodging, also a dollar for every visitor and the profits on all the wine sold. Many of them grew rich. In some cases, they rented their houses, gaudy furniture and all, from exceedingly respectable citizens.

The houses of the second class were fur-

nished with less splendor, and the patrons cared less about order and the semblance of refinement. Here there were more foreign-born women, and also a number of prostitutes who were no longer sufficiently young and attractive for the Parlor Houses. The wines and liquors sold were less expensive, and everything was arranged for men who could not afford to spend large sums of money.

There were many brothels which appealed to foreigners. The German newcomers, not all of whom were very quick to learn the English language and to adopt American customs, gathered in resorts of their own. Their brothels, even in those where the fee was small, were neat and orderly. As in the mother country, the prostitutes were often to be found sewing or knitting while they were waiting. Many of the houses were primarily beer saloons, and not all who visited them came to engage in amorous adventures. A casual visitor might not know, before entering the place, that it was a brothel, but a girl would come up and ask to be treated. There were also a number of German dance halls, serving to a certain extent as places where the prostitutes might solicit custom.

In the saloons catering to sailors, there was a great deal of drunkenness and rioting; and the women in these places had to be durable rather than lovely. It was necessary that they should be able to drink a great deal with their maritime friends and yet not become drunk themselves. It was sometimes part of their duty to unload the pockets of any money a

sailor still had after he had treated everybody in the room until he was no longer able to keep his feet.

There were brothels of a still lower order. Sanger tells us about the houses in the slums: "They are generally kept by an old prostitute, who gathers around her some of the most debased of her class, takes a cheap basement wherever she can obtain possession of one suited to her purpose, erects a small bar furnished with three or four bottles of the commonest liquor she can procure, partitions off one or two small hovels of bedrooms, and forthwith begins housekeeping. . . . These dens are largely patronized by the vilest of the male sex: the petty thieves who hang around the public markets, stealing from the wagons, or who haunt the doors of grocery stores and abstract whatever they can reach; as they find them convenient places of concealment, and can frequently dispose of their booty by means of the women. Another class of visitors consists of the lowest order of rowdies, who assume a free license to perpetrate any mischief they please, because there is no one to interfere with them. . . . It is dangerous for a stranger to enter a place of this description, for if he does not get his pocket picked by one, he will most probably be assaulted by the other class of visitors."

There were, too, "panel houses," lodging houses for prostitutes which were especially constructed with secret doors, so that the visitors were usually robbed of their money. These were meant especially for strangers in

the city, and those who had taken a few drinks offered an especially easy prey.

Sanger tried to learn the number of prostitutes in the city during the winter of 1856-57. There had just been a commercial panic, and it was believed that the number of harlots in New York was increased by at least one fifth as a result. The chief of police estimated the number at five thousand or less. The inspectors of police gave figures for each district, and the total amounted to less than four thousand. Sanger made allowances for the harlots in hospitals and jails, and he thought there were probably about six thousand courtezans in the city altogether. The number must have been still higher, especially if the women who received money from many men, but who did not live in brothels and who were engaged in some other occupation as well, were included.

The police reported 378 houses of prostitution and 89 houses of assignation, not used entirely by professional courtezans. We must bear in mind the fact that brothels were not recognized by law, and that some attempts had been made to suppress them. It is obvious, then, that these figures are too low. The population of the city in 1858 was about 700,000, but there were large places suburban to it whose inhabitants were accustomed to come to New York for pleasure.

Sanger's calculations led to the conclusion that little less than a capital of four million dollars was invested in prostitution. He thought that the receipts of the prostitutes amounted to about three million dollars a year,

and that the amount spent for intoxicants in brothels came to about two million annually.

Letters were written to the mayors of the principal cities of the country in which they were asked to estimate the number of prostitutes to be found within their jurisdiction. The figures they give are in some cases palpably wrong. The mayors were misinformed, or they were anxious to show that their cities were unusually chaste. The results as tabulated by Sanger may be of interest, however:

New York on the resident population of the city proper, has	1	prostitute to every	40	men
Including the su- burbs	1	" " "	64	"
Buffalo has	1	" " "	65	"
Louisville has	1	" " "	64	"
Newark has	1	" " "	366	"
New Haven has	1	" " "	87	"
Norfolk has	1	" " "	29	"
Philadelphia has	1	" " "	344	"
Pittsburgh has	1	" " "	192	"
Savannah has	1	" " "	44	"

Sanger considers that the figures for Philadelphia, Pittsburgh, and Newark are worthless. "In both Norfolk and Savannah," he says, "we presume that the larger portion of the abandoned women at the time the census was taken were colored women, whose virtue is always at a discount under the most favorable circumstances, and to which a seaport is always fatal." The mayor of Savannah reported that there were 93 white and 105 colored prostitutes, together with "supplies

from New York City, ' who came during the winter.

In the South, most of the Negresses who were to be found in brothels were no doubt slaves. In New York, too, there were many colored prostitutes before 1860. These were, of course, free women. They had not been taught that chastity was a virtue for them, and the problem of earning a living was for them peculiarly difficult.

Sanger thought that prostitution was a great evil, but one that could not be entirely suppressed, and he argued in favor of some such system of regulation as then prevailed in Paris and other European cities. "The lash, the dungeon, the rack, and the stake have each been tried," he says, "and all have proven equally powerless to accomplish the object. Admitting that, in religion, morals, or politics, it is impossible to force concurrence in any particular sentiment, while a kindly persuasive plan may lead to its adoption; admitting that all attempt to compel prostitutes to be virtuous have notoriously failed; has not the time arrived for a change of policy? If, in direct ratio to the stringency of prohibitory measures, the vice sought to be exterminated has steadily increased, does not reason suggest the expediency of resorting to other measures for its suppression? . . . In common with other nations, we have passed laws intended to crush out prostitution; have made vigorous protests (on paper) against its existence; and there our labors have ended. The experience acquired in this course of legislation only demonstrates

that such laws cannot be enforced so as to produce the desired effect. But why are they still retained on the statute books? . . . It is not to be supposed that any system of laws will entirely eradicate prostitution; history, social arrangements and physiology alike forbid any such utopian idea. But will not a more enlightened policy do much toward diminishing it?"

As to laws against prostitution, we have them in greater abundance by far than was the case in the middle of the nineteenth century. The police raid an occasional brothel, and the less naive portion of the public assumes that the regular hush money has not been paid or that it is necessary to please the good ladies of the W. C. T. U., with a view to the next election. This much is certain, that there would be less chance for robbers, burglars, and murderers to escape if the law-enforcing officials were not expected to devote part of their time to the seizing of petty gamblers, venders of beer and whiskey, and women of pleasure.

The registration of prostitutes, which Dr. Sanger desired, may be of hygienic value, providing that the medical examinations which go with it are not merely perfunctory. He was obviously right in demanding that women should be able to secure treatment for venereal disease at the public cost without first being convicted of vagrancy. However, it is true that governmental control cannot be complete in a large city. Besides, American thought has, up to recent years, been individualistic.

And now, when paternalism has gained a strong position among us, it is chiefly puritanical. The government is supposed to be suppressing, not regulating, prostitution.

The prostitution problem is first of all a hygienic one. Before syphilis was feared, the whole matter wore a different aspect. When Sanger wrote his book, there was in New York no free hospital for the treatment of venereal disease except the one on Blackwell's Island. The name suggests lunatics and petty criminals—it has recently been changed to Welfare Island, but since the same asylums and prisons remain, the associations will not be different. The diseased harlot who wanted medical treatment and could not pay a private physician, or who needed nursing and care which she could not secure except in a hospital, might possibly be received in one. As Sanger describes the situation in 1858, "The principal public or free hospital where the venereal disease is *confessedly* treated is the Penitentiary Hospital on Blackwell's Island, now known as the Island Hospital. To obtain the benefit of medical treatment therein, it is necessary that the patient should have been sentenced from the Court of Sessions to the Penitentiary for the commission of some crime; or committed to the Workhouse by a police justice for vagrancy, drunkenness, or disorderly conduct. From this fact it will be seen that there is, strictly speaking, no 'free' hospital for such diseases, as the only one intended for their treatment will or can receive none but those sentenced for an infraction of the laws."

Both men and women who came to the public dispensaries to be treated for syphilis or gonorrhea were advised, if their cases were severe, to appear before a justice of the police and confess themselves guilty of vagrancy. They were then confronted with the alternative of doing without the necessary treatment or being sentenced for from one to six months in one of the correctional institutions on Blackwell's Island. There they were treated as prisoners and forced to wear the regulation uniform. The greatest faults of such a system were two: many prostitutes and other diseased persons refused to receive medical care on such terms, and those who did permit themselves to be enrolled as convicts were frequently turned into true criminals by their experience. The method is still employed in the case of narcotic drug addicts who wish to be cured and who are unable to pay the fees charged by private sanitariums.

A CHANGING POINT OF VIEW

To Sanger, it appeared that prostitution was an evil which could not altogether be eradicated, and that it was best to deal with it as a permanent condition some of the worst evils of which could be removed. Most physicians and students of social conditions during the middle of the nineteenth century agreed with him. In the United States as in Europe, all attempts to suppress it had failed. Brothels could be closed, of course; notorious courtesans could be punished and exiled; but prostitution, under one form or another, persisted. Moreover, restrictions upon "legalized vice" invariably caused greater temptations to be placed in the way of respectable women, married or unmarried.

Great Britain, where the regulation of courtesans according to the Continental methods was unknown during the first half of the century, experimented with them in the 60's and 70's. The Contagious Disease Act was slipped quietly through Parliament in 1864. Two years later, twelve English and two Irish districts which suffered greatly from venereal disease because of the many soldiers and sailors to be found there, were placed under sanitary control similar to that of Paris and Berlin. The statistics show unmistakably that syphilis and gonorrhea in the regions subjected to the provisions of the Contagious Disease Acts were

reduced as a result of the compulsory physical examinations of prostitutes. It was the idea of English liberty even more than the Nonconformist conscience which these laws offended, and Herbert Spencer was prominent among the men and women who worked for their repeal, finally secured in 1883.

In the United States, great attention was paid to the English experiment. While all was going well, the American agitators for police regulation were hopeful of extending a similar system to this country. When the Contagious Disease Acts were suspended, their case was finally lost. There were still to be sporadic attempts to secure from states and cities definite recognition that prostitution existed, but the puritanical opponents were almost universally successful after 1883.

In 1870, the Missouri legislature authorized the city of St. Louis "to suppress or regulate houses of ill-fame." There were in that city a large number of people who had recently immigrated from Germany, and it was desired to regulate the brothels rather than to attempt to suppress them. The prostitutes were to be examined by six physicians, each of whom was given a special district. The number was insufficient, the authority given to the inspectors and the police for the enforcement of the regulations was inadequate, and yet it appeared that conditions in the city improved. The Missouri law was repealed, after a very short trial, because of moral indignation. An anonymous writer in the *St. Louis Morning Advertiser*, January 12, 1895, declares that the repeal

"was the result, not of any failure of the measure to accomplish the wholesome ends for which it was enacted, but it was in obedience to a morbid sentiment, begotten in absolute ignorance of the subject. There was not a vote from any member representing a city constituency favorable to the repeal of the law, and not a vote expressive of the sentiment of a country constituency against it. The incidents attending the event were dramatic. Throughout the State there was a moral uprising against what was regarded as the licensing of vice, and the lobbies of both branches of the legislature were taken complete possession of by the clergy of the various denominations and earnest co-workers of the other sex. A petition, praying for the repeal of the obnoxious law, signed by more than one hundred thousand good people, was presented. The document was cumbersome. A wheelbarrow decorated with white ribbons, and accompanied by a group of innocent young girls attired in spotless white gowns, was brought into service, and on it the gigantic and emphatic protest against the licensing of vice was wheeled up to the clerk's desk to be read. Courageous, indeed, would have been the country member who would have voted otherwise than he did. There were, of course, counter-petitions from the cities, and conspicuous among the signers of these latter were members of the medical profession. Indeed, I am sure the law received the almost unanimous endorsement of the doctors of medicine, as it received quite as unani-

mously the condemnation of the doctors of divinity."

Saloons and brothels are of chief concern to the citizens of large cities. The opposition to them comes largely from the villages and the country districts. Does it, then, reflect disinterested virtue? Have we not reason to think of the fable of the dog in the manger in this connection? Whether or not country people are chaster than those who live in cities, they are certainly, as a class, less intelligent. Men who excel in the professions or in business find that there are much greater opportunities for them in such cities as New York, Chicago, Boston and Philadelphia. The New York day-laborer may not be any better endowed with brains than the farm hired man, but he has more varied experiences and better educational facilities of all sorts. Narrowness and intolerance are provincial weaknesses especially. I do not mean to argue that every city dweller is wise and broad-minded, while every farmer is foolish and unable to see beyond the end of his nose; but I think that the rural interference with urban methods of pursuing happiness is a particularly vicious kind of tyranny.

The St. Louis experiment, because it was imperfectly carried out and ended before it had had a fair trial, proves nothing either way with regard to the advantages of regulation. The results have been cited by debaters on both sides of the question of tolerating and controlling prostitution, however, because it was the chief attempt to carry out the Continental

system in this country under definite legal authorization.

Under the St. Louis law, all prostitutes and kept mistresses were required to register their names and addresses, and to give notice whenever they moved. They did not have to live in brothels, but the fact that they resided in houses or rooms of their own did not exempt them from the general supervision. They were supposed to be examined weekly by physicians, at least if they appeared to be diseased. Although this provision was laxly carried out, the leading medical authorities of the city believed it to be of sanitary advantage. A hospital was maintained for venereally diseased courtesans, and it was supported by fees collected from the keepers of brothels and the women who carried on prostitution in furnished rooms. All public and semi-public forms of soliciting were barred, and brothels were not distinguished by red lights or other signs.

During the Civil War, the medical officers of the United States army in Nashville, Tennessee, required the prostitutes of that city to submit to regular examination. According to Colonel Fletcher, who was in charge of the work, venereal disease among the soldiers became extremely rare. The system lasted for nearly three years, and it was regarded as an unqualified success.

In 1871, the legislature of New York passed an act for the regulation of prostitution, but the governor failed to sign it. In 1875 and 1876, there were several attempts made to legalize the traffic, but nothing important was done.

A New York grand jury in 1876 strongly recommended the supervision of prostitution by the health and police authorities. The opposition was too powerful to be overcome. Sentiment was crystallizing in favor of a single standard of sexual morality. In Pennsylvania, in St. Louis, in Cincinnati, and in Congress with regard to the District of Columbia, there were unsuccessful efforts made to secure a frank recognition that prostitution existed and was likely to exist for some time.

In the 1890's, the New York police officials were less willing than they had been in the 1850's to admit that they knew of the existence of prostitutes and brothels. As a matter of fact, prostitution appears to have grown even faster than population. The city was "wide open." It had a population of between a million and a half and two million during this decade, and the inclusion of Brooklyn brought the official figures for 1900 close to three and a half millions. The suburbs were becoming populous, and their male inhabitants frequently came to Manhattan Island in search of pleasure. The number of prostitutes in New York in 1895 was estimated to be somewhere between 25,000 and 50,000.

The regular international trade in young women had grown considerably. The Italian "padrones" were bringing in a great many girls of ten or twelve and filling brothels in the lower part of New York with them. The children were actually slaves. The white slave traffic was not confined to girls, however. Many boys were brought from Italy and trained

to be beggars, street musicians, bootblacks, etc.

It is not true, though, that immigration in general was increasing the proportionate number of prostitutes. Since Sanger made his investigation, the proportion of American-born courtesans in New York and other cities of the United States had gone up a great deal. In fact, it is likely enough that he had to do mostly with the friendless, and that he therefore exaggerated the number of foreign harlots in 1855-58.

The great Russian-Jewish immigration into New York began about 1881, and since that time it has been large. From other countries, too, where the social conditions were more or less similar, the Jews came in considerable numbers. The Jewish writers claim a high sexual morality for their people, and this seems to be conceded by most Gentile critics. The matter cannot be determined statistically, though. This much can be said, that a great many Jews took part in the business of prostitution in New York in the period from 1885 to 1915; no doubt there are still many engaged in it. For all classes of immigrants, especially those who came from rural districts, there were special temptations in prostitution. The children, becoming accustomed to American standards of life and, above all, to the more showy luxuries, were dissatisfied with home conditions. They lost their respect for the parental teachings, and they became accustomed to learning about American ways from the companions they met in the streets rather than at home. Yet the available statistics in-

dicates that the foreign-born women contribute fewer prostitutes, in proportion to their total number, than do those of native birth, at least in New York. If children born in America of foreign parents were separately considered, it might quite possibly come out that more than their share become courtesans and concubines. The statistical treatment of prostitution has become practically impossible, and it is necessary to say that some of my conclusions about present conditions are more or less subjective. There is some reason to believe that the daughters of the foreign-born have swelled the ranks of the flappers rather than of the professional prostitutes.

I deal chiefly with New York simply because the best studies of prostitution in the United States have to do with that city. It might in many ways be better to investigate the development of illicit relations in Boston and Philadelphia, where prudery (and, I believe, prostitution as well) are more common than they are in New York. Comparisons are very difficult to make because of the lack of registration of harlots. To compare the number of women arrested for sexual offenses is to learn more about the attitude of the police than about the prevalence of illicit relations in the various cities. Illegitimacy statistics, when they are available, help little to solve the problem. The active harlot is not likely to bear many children; and illegitimate births would afford a rough index of the repressive measures taken with regard to prostitution if

the increasing use of contraceptives did not upset the whole matter.

As to the comparative morality of city and country, various opinions have been expressed. It is easy to assume that immorality is more usual with New Yorkers than with residents of Cornfield Junction, because there are cabarets and dance-halls and all sorts of noisy resorts in the metropolis, and also because the rustic finds a variety of seductive influences in his way when he comes alone for a visit to a large city. A woman who lives in a village of the Catskills expressed a truer view when she said that her sons needed only a gallon of gasoline and the use of the family car to induce girls to have relations with them, while a young man living in New York would probably be exposed to considerable expense.

The Raines Law, enacted in 1896, did much to stimulate prostitution. It provided simply that liquor might not be sold on Sunday in the ordinary saloon, but there it should be available to people eating meals in the restaurants attached to hotels. Saloons have more recently turned into "soft drink parlors," but the Raines Law converted large numbers of them into brothels. If space was available behind or above the barroom, it was partitioned off into sleeping quarters. Since, however, most travelers preferred the regular hotels, there was some prospect that the bedrooms would represent an economic liability. But some bright person conceived the idea that they might profitably be used as assignation houses.

An attempt had been made shortly before—

for there were brief fits of puritanism at intervals throughout the nineteenth century—to close the notorious brothels and to purify the districts. The result had been the dispersal of the prostitutes, chiefly throughout the slum districts. They were not welcomed in the Ghetto, and on at least one occasion a rabbi made a fiery speech against prostitution in an East Side street which they had pretty much taken over to themselves. The immigrants had little influence; and the politicians were concerned with making as much for themselves as they could without giving the reformers a chance to oust them. They welcomed the Raines Law hotel, which scattered the harlots among more or less residential districts, and which tended to make them less conspicuous on Broadway. Besides, every saloon-keeper who became also the head of a house of assignation found it necessary to be on good terms with the city administration and, above all, with the police officers. An arrest would mean not merely the paying of a fine, but probably the revocation of his license to sell liquor as well.

In 1895, Dr. F. R. Sturgis, who was a member of the medical staff of the New York City Hospital, lamented the fact that the prostitutes, who came to be treated for venereal diseases were no longer compelled to stay for a certain length of time. As soon as they felt a little better, although their diseases were still contagious, they were anxious to get out and return to their trade. Sturgis thought that

syphilis was steadily increasing in the city, largely because of this fact.

Asked how it might be checked, he replied: "Proper control, if honestly and conscientiously carried out, would in my opinion, decidedly check the increase of the disease, and probably decrease not only its virulence of the disease, but its frequency. As to the plan, I must decline to commit myself to any special one, as it is impossible, in the present condition of municipal politics, to even hope that such a thing would be conscientiously and thoroughly carried out. Irrespective of the question of official blackmail which is always in these cases possible, and which a recent investigation in this city has shown to be more than possible, the sentiment of the Angle-Saxon race, whether wise or foolish, is strongly against the question of official supervision and control of this evil. Although it is a self-evident fact that such things as harlots and syphilis exist, we declare that nothing shall be done to check or control them. In sanctified circles such control, I understand, is considered a compromise with sin."

The white slave agitation arose in Great Britain during the last decades of the nineteenth century, and became of wide general interest in a number of countries in the first few years of the twentieth. A German writer, Felix Baumann, declares that there were at one time about 20,000 dealers in women in New York. The number is certainly far too great, even if some of them were "whole-

salers" who sent foreign girls into cities of the interior.

In French official documents, the term *Traite des Blanches*, traffic in white women, was first used for the international commerce in prostitutes. The contrast was with the *Traite des Noirs*, the African slave trade, against which a number of international agreements had been made. White slavery is not an entirely accurate term. Some of the women are practically enslaved, but it is rather because of their ignorance than because they are held by a superior force. Girls are often taken to foreign countries, where they expect to receive good theatrical positions, and then brought into brothels. Or, even if they know why they are going abroad, they do not realize that their inability to speak the language and to understand foreign laws and customs will very likely cause them to fall into a state of entire dependence on the brothel-keeper. In a minority of cases, the women are bought and sold, and they derive no personal gain from their prostitution.

Jane Addams tells of a Breton girl who was brought to the United States as an actress and put into a Chicago brothel. Although she earned about \$250 a week, she received no money for herself. She was made to perform various household tasks, she was disciplined with a stick, and she was never allowed to leave the house. How typical such a case was in the first decade of this century, it is difficult to tell. Sensational writers seized eagerly upon the available details, and perhaps they

give an untrue idea of the way prostitution was then organized. There was never, so far as I have been able to learn, a great international syndicate for the supplying of brothels. There were dealers in women, undoubtedly, and they often had foreign connections. The genuine enslavement of prostitutes was always a risky business, though, except perhaps in the case of the children handled by the "padrones." Most usually, the women were told that they were at liberty to depart freely, providing that they first paid their debts. In order that these might be larger, they were encouraged to buy expensive clothes and luxuries of all sorts through the woman manager of the brothel, who added a generous profit for herself.

The first international white slave congress was held in 1899, and there were several later ones. In 1906, a vigilance committee for the suppression of the traffic in women was formed in the United States. In 1910, as the result of much yellow journalism and vigorous puritanical propaganda, the Mann Act was passed. Under its provisions, "any person who shall knowingly transport or cause to be transported or aid or assist in obtaining transportation for or in transporting in interstate or foreign commerce or in any territory or in the District of Columbia, any woman or girl for the purpose of prostitution or debauchery, or for any other immoral purpose," is liable to a penalty of imprisonment for five years or a fine of up to \$5,000, or both. In case the girl

who is transported is under the age of eighteen, the penalty may be doubled.

What is an immoral purpose? In a statute, such words are absolutely absurd. The lawyers who prepare acts use involved clauses and ancient formulas to make absolutely clear the intent of a law, and then they frequently put in a phrase that may mean anything or nothing. A purpose is immoral when some transgression against the ordinary standards of right and wrong is intended. A broad interpretation of the Mann Act would make the man who sends a young girl into another state, or who even gives her enough money to ride on a street car from one place in the city of Washington to another, for the purpose of telling a lie, liable to a ten-year term in a Federal prison and to a fine of \$10,000. The law was intended, however, to break up the so-called "white slave traffic," not to prevent lying. For immorality, to the puritan and the prude, means a violation of the accepted standards of sexual behavior. It is unfortunate that the W. C. T. U., the Methodists, the Baptists, and the *Christian Science Monitor* are remaking our language to suit themselves. Temperance stands for abstinence and virtue for chastity in the ordinary usage of today. Perhaps the day is not far off when rascality will mean chewing gum and thus violating the terms of the Forty-sixth Amendment.

The idiocy of the man who wrote the act of 1910 left to the United States Supreme Court the task of deciding what it meant. In other words, it gave that nominally judicial body a

legislative task. To understand the present effect of the law, it is necessary to turn to the Diggs-Caminetti decision of 1917. Here is established the principle that the man who takes a woman into another state, or who brings her into the United States, or who travels with her in a district under the direct control of Congress, not for the purpose of sharing the money which she may earn in prostitution of concubinage, but simply to commit fornication or adultery with her, is a great criminal.

As everybody knows, or ought to know, there are many thousands of people engaged every twenty-four hours in immorality. It is a fact. Convictions under the laws of those states are few. When they occur, the penalties imposed are almost always light. In the state of New York, where adultery is the only cause for the granting of a divorce—although a legal fiction brings about the same effect in certain cases of desertion—we might expect that every decree would be followed by the conviction of at least two persons. This is far from being the case.

What, then, has the Mann Act accomplished? It has made the crossing of the imaginary line which separates one state from another the gravamen of a very serious offense. Puritanical morality has gained nothing by it. Only the blackmailers and certain vicious people who desire to revenge themselves upon their enemies have benefited by it. If it were actually and exclusively directed against slavery, it would be difficult to find any reason for condemning the law. There may be advantages

in a system of involuntary servitude, but there is no good reason for applying it only to the brothel. But the man who is convicted under the Mann Act, as matters stand today, must be considered simply as being unfortunate.

Dr. Howard B. Woolston has written a work on *Prostitution in the United States* in two volumes, of which only the first one is available as I write. This was published by the Century Company in 1921, under the auspices of the Bureau of Social Hygiene. The organization presumably approves what Woolston has to say about the Diggs-Caminetti decision: "This reasonable interpretation of the White Slave Act to cover the cases of immorality where the parties involved crossed state lines has been popularly regretted and criticized in some quarters, but by the majority of right-thinking citizens it has been applauded as a means of lessening the traffic in women under any excuse."

The last word gives away the pretense of morality. The New Puritans are glad of any excuse, of any pretext, to twist the laws in favor of their own diseased ideas. They display a casuistry more complicated than any ever devised. They are encouraging banditry and murder and blackmail. The disrespect for the laws of which they complain is something for which they are themselves primarily responsible. A "right-thinking" citizen is apparently one who lacks the courage or the ability to do any thinking at all.

The usual case in which a man pays a woman's way into another state has nothing

to do with prostitution. The New Yorker who wants to have relations in Jersey City or Providence or Chicago is not compelled to take a courtesan from his own city with him. He can find harlots almost anywhere that he goes. They accost him on the coastwise steamers, on the railroad trains, in the streets. If he buys a ticket for a woman who is not his wife, it is because she has an individual value for him, perhaps amounting to love. Concubinage is not always easily to be told apart from common-law marriage, which is recognized in many of our states. Certainly it is unfortunate that the Mann Act has been used—indirectly as well as directly—to make men of considerable ability and accomplishment unhappy for what normal people must consider a very venial sin or no sin at all.

The Mann Act has done little or nothing to reduce the amount of prostitution in the United States. Some of the committees organized in the various cities have, however, succeeded in reducing the commercial aspects of illicit relationships. The New York Committee of Fifteen and its successor, the Committee of Fourteen, are worthy of special mention in this connection. Both these organizations were opposed to the Continental methods of regulating prostitution. It was argued that the systems of sanitary control are imperfect. Even if a woman is properly examined every week or two and found to be healthy, she has ample opportunity in the meanwhile to contract the disease of syphilis or of gonorrhea and to spread it to others. Moreover, the latent state of syphilis

may last for two or three years; and it is impossible to keep every prostitute who is venereally diseased in a hospital or an asylum for so long a period. Besides, it is impracticable to examine all the male patrons who wish to enter a brothel. But the physicians who are in favor of regulation do not claim that a system of control is capable of putting an end to the venereal diseases in a few months. They say simply that it makes for better hygienic conditions. Syphilis and gonorrhea are spread not simply through prostitution. They can be acquired in a variety of ways which have nothing to do with erotic relations.

The Social Evil, edited by Professor Edwin R. A. Seligman of Columbia, presents the views and the achievements of the two New York committees. Here we read that "all parties will agree" to certain preliminary conclusions: public solicitation should be eliminated, there ought to be no connection between prostitution and the sale of intoxicants, adequate treatment should be provided for the venereal diseases, growing children should not be kept in brothels, and tenement house conditions in general should be improved.

The proposals are of varying value. The Prohibition laws have made it impossible to keep liquor out of the brothel. A house where one illegal traffic is carried on is likely to be used for others as well: one might as well be hanged for a sheep as for a lamb. But is liquor in any sense the cause of prostitution? The man who is pleasure-bound may be interested in both vices, of course; and it is true that the

harlots themselves are usually fond of intoxicants. There is no invariable connection, though. As to the providing of adequate facilities for the treatment of the venereal disease, only a fanatic can object. It is no more wrong to cure syphilis than it is to provide care for the patient suffering from tuberculosis, cancer, diphtheria, or infantile paralysis. If one is a scourge of God, so are the others. If cancer can be cured by fasting and prayer, so, no doubt, can gonorrhea. But physicians are pretty decent fellows as a class, and I should not care to turn their business over to the priests. Besides, it is barely possible that medicine can do some things which faith cannot. Medical understanding of the venereal diseases is far greater now than it was fifty or twenty years ago. The nostrums purchased in drug stores are probably as efficacious as prayer, but it is best for the person who thinks he may be venereally diseased to see his physician. Else he may be doing a great injury to himself and perhaps to persons who are dear to him.

The problem of the tenement house and the slum district, although it is certainly connected with prostitution, is so complex that it cannot adequately be considered here. The same thing may be said about the minimum wage, especially for women. The defenders of the capitalistic system have been induced to agree to many social concessions out of fear that pure socialism might otherwise come about. Bebel and other socialist leaders have vigorously opposed prostitution, most of them maintaining that it is a result of glaring economic

inequality. It appears that the Bolshevistic rule in Russia has put an end to open prostitution. This has been accomplished—and there is probably no other way of doing it—by increasing sexual freedom in general. Easy divorce diminishes both prostitution and concubinage. Greater opportunities for women also decrease the need of accepting pay for immorality.

The New York Committee of Fifteen and similar organizations elsewhere did creditable work in opening a number of hospitals to venereal sufferers. In trying to combat the dance-hall and other forms of amusement which they considered undesirable, they stimulated the playground movement. City parks were improved, band concerts were inaugurated, and increased attention was paid to public libraries because of their propaganda. As to the influence of the reformers on the photoplay, this may easily be exaggerated. The building of many theaters, some of them containing several thousands of seats, has made it necessary for the producers to please family groups, some of them with puritanic ideas. Exhibitors in the small towns still complain that there is too much kissing in the photoplays, and that the knees of the actresses are sometimes made manifest. However, the American films are rather of a sickly sentimentality and of appeal to children under the age of twelve than in any sense indecent.

The Committee of Fifteen recommended in 1902 that the laws against prostitution should be repealed. The members saw clearly that

they served only to enrich the politicians and the police officials. They were opposed to a segregated district, though, and they were unwilling that the harlots should take up their quarters in crowded tenements. They thought that a special body of morals police should be established to deal with courtesans.

While New York was still "wide open," extremely high fees were paid by the brothel-keepers. Seligman's book tells us of a fifty-cent house containing not more than ten prostitutes for which an initiation charge of \$500 was made, with \$600 more to be paid annually thereafter in monthly installments. The alderman of the district, the policeman on the beat, the roundsman, the sergeant, and various higher police officers all got their share. In return, the brothel-keeper received the privilege of advertising openly. There were men stationed in the street to pull in customers, "and children of the neighborhood were given pennies to distribute the cards of the prostitutes." Investigators found over three hundred apartments occupied by harlots in Manhattan at the beginning of the twentieth century, and their work was incomplete. Sanger's statistical investigation was, in fact, the last one made in New York which could pretend to anything approaching accuracy.

In 1910, when the white slave agitation was at its height, John D. Rockefeller, Jr., was the foreman of a special grand jury charged with investigating the traffic in New York County. No international syndicate was discoverable, but there were restaurants and clubrooms

where persons financially interested in the management and the supplying of brothels met. Aside from the regular houses of prostitution, the Raines Law hotels, as well as massage and manicure parlors, were found to be serving the courtesans. The licensing of massagists in some American cities and states has perhaps decreased their tendency to take part in prostitution.

In 1905, there were over 1200 Raines Law hotels in the New York boroughs of Manhattan and the Bronx. Practically all of them were violating the law in more than one way. First of all, they did not maintain genuine restaurants. The Raines Law sandwich often was carefully covered with tissue paper, and a rubber band was placed around it to indicate that it was not meant to be eaten. Upton Sinclair, in the days that he was maintaining himself by hack writing, wrote a perfectly good one-dollar joke about the saloon-keeper who complained that his Sunday's business had been ruined by the careless person who had actually consumed the sandwich laid before him. Most of the "hotels" were old wooden shacks, and the violations of city ordinances were many. Pressure was laid by the reformers upon the brewers who outfitted such places and upon the bonding companies that guaranteed their good conduct. As a result, the number of Raines Law hotels in Manhattan and the Bronx decreased to 87 in 1911. In the last years of the saloon, it had comparatively little to do with prostitution. The connection had in a measure been forced

upon the liquor-dealers; and they did not particularly object to the loss of their hotel licenses, since it was arranged that they should be allowed to keep open on Sunday. Sometimes only the side entrances—those dedicated to families—were kept unlocked, and unknown customers were not encouraged. The patrolmen came in to investigate as a matter of course, and when they came out, wiping their lips, they were perfectly sure that the law-abiding proprietors kept their saloons closed on Sunday. The New Puritans were outraged by such flagrant lawbreaking, and they finally made it possible for the patrolman to get a drink or two every day of the week, and new shoes for his baby besides. Well, walking the beat is undoubtedly thirsty work.

The successful attack upon the Raines Law hotels did not appreciably diminish prostitution in New York. It sent some women into the brothels and others into furnished rooms in tenement houses. The courtesans flocked back to Broadway and to various other streets where men walked in large numbers. Outside the brothels, boys of fifteen or sixteen stood and helped the passers-by make up their mind. These "lighthouses," as they were called, were watchmen, too. Some politician who had not received what he considered his fair share of the blackmail money or who had a morbid desire to please the puritanical reformers might cause a raid to be made, and in that case it was advisable that the women should be warned beforehand. But the chief task of the "lighthouses" and of some older men sta-

tioned in the street was the pulling in of patrons.

The "lighthouse" who proved himself capable became a "cadet." The "cadets" were young men, usually between 18 and 25 years old, charged with the work of finding girls who could be induced to enter the brothels. The sensational books tell us that they usually promised marriage or that they otherwise engaged in trickery. They were recruiting officers, and we can be certain that they never emphasized the unpleasant aspects of the profession. It is probable, though, that their most inviting field was among young women who were semi-professional or professional prostitutes outside the brothels. The great majority of them knew what they were doing when they entered the houses. They were not brought in under the influence of drugs or believing that they were simply moving to new lodgings. When prostitution was least disturbed by the police, such tactics were dangerous. I do not say that they were never used, but simply that they were not typical. The reformers who believe that "any excuse" will do have not hesitated to present isolated instances of such outrages as though they indicated the usual state of affairs in the old days.

In 1906, the social hygiene movement became strong in the United States. What this has been and still is does not appear very clearly from the name. In the case of all infectious diseases, and to a considerable extent with regard to all maladies, hygiene must in part be social. The American Social Hygiene

Association, with headquarters in New York, and the various local organizations with similar titles are really Anti-Prostitution Leagues. Their point of view is moral rather than sanatory, and they are opposed to all forms of legal recognition and authorized control.

In 1910, the legislature of the state of New York passed the Page Law, which provided that women convicted of vagrancy should be examined by physicians of their own sex, and that if they were suffering from venereal diseases they should be imprisoned and given treatment until they were cured. This Erwhonian act was later declared unconstitutional. The legislature had no right to punish prostitutes for their illness, even though the object of the imprisonment was their cure.

In 1911, according to Professor Seligman, there were in the United States 32 cities which regulated prostitution in one way or another. The control was closest in Atlantic City and in Cheyenne, where there were segregated districts and compulsory medical examinations for courtesans. The "red light district," without sanitary control, flourished in a number of important places.

The Bureau of Social Hygiene directed a study of conditions in New York in 1912, the results of which are summarized in George J. Kneeland's *Commercialized Prostitution in New York*. At this time, the city was still "wide open." We are told, indeed, that there were companies formed to operate brothels, and that the shares were offered for sale in special exchanges. For Sanger, as we have

seen, a "parlor house" was a brothel of the first class. More recently, it has meant any house devoted exclusively or almost entirely to prostitution. The fee ranged in 1912 from fifty cents to five or ten dollars. In the cheaper brothels, there was little cleanliness and no luxury. A few of the houses were regularly visited by physicians, but their examinations were usually hasty. At least one case is known where the doctor issued a certificate of perfect health while he was treating the woman concerned for a serious case of syphilis.

The brothel physicians, together with other persons interested in the "parlor houses," belonged for the most part to an organization called the Independent Benevolent Association. This was the closest approach to the great syndicate or trust about which sensational journalists, ever anxious to raise public morality and increase the circulation of their papers, were writing.

A few of the houses were open only to selected lists of patrons, but most of them welcomed every visitor who had the required price. Chauffeurs and cabmen were paid for the patrons they brought, and there were also special agents or runners. Some of the more pretentious brothels were said to be under the protection of influential politicians.

In recent years, the number of brothels in New York appears to have decreased. Street solicitation is comparatively rare. For the poor man, it seems that the facilities are much

less than they were before the war. As in the case of liquor, the man who can afford to spend a large amount is pretty well taken care of.

During 1917, Dr. Woolston carried on an investigation in forty American cities, not including New York. He sent ahead "an experienced field scout" in every case. Among the forty, he found ten where the police admitted that they were tolerating segregated districts. In seven of these ten, the police kept a register of courtesans. Especially in the larger cities, though, there were many unenrolled harlots.

One of the places visited was Douglas, Arizona. The health authorities there issued in January, 1917, a list of regulations governing women of the restricted district. An examination, including a Wassermann test, was required of every prostitute as she entered the segregated zone and every three months thereafter. Licenses were issued to those women whose tests showed a negative reaction or whose physicians certified that, although they were diseased, they were non-infective. A charge was made for the certificates and the examinations.

"Publicly recognized markets of vice have been largely done away with," Dr. Woolston declares. "Their place, it is true, has partially been taken by new centers of activity, but these latter are furtive and surreptitious. Their blatant air is gone, and business is not what it used to be. Like any other commer-

cial enterprise, prostitution thrives through publicity and dwindles when it becomes difficult and dangerous."

As a matter of fact, there are still many American cities where the courtesans parade the streets as openly and in as great numbers as ever. Women are sometimes arrested and sent to reformatories, but the mass of the traffic continues. A new turn was given to the prostitution laws in several states during the Great War, when it was provided that the men found in brothels might be punished.

THE PHILOSOPHY OF IMMANUEL KANT

I. ROADS TO KANT

Never has a system of thought so dominated an epoch as the philosophy of Immanuel Kant dominated the thought of the nineteenth century. After almost three-score years of quiet and secluded development, the uncanny Scot of Königsberg roused the world from its "dogmatic slumber," in 1781, with his famous *Critique of Pure Reason*; and from that year to our own the "critical philosophy" has ruled the speculative roost of Europe. The philosophy of Schopenhauer rose to brief power on the romantic wave that broke in 1848; the theory of evolution swept everything before it after 1859; and the exhilarating iconoclasm of Nietzsche won the center of the philosophic stage as the century came to a close. But these were secondary and surface developments; underneath them the strong and steady current of the Kantian movement flowed on, always wider and deeper; until today its essential theorems are the axioms of all mature philosophy. Nietzsche takes Kant for granted, and

8 THE PHILOSOPHY OF IMMANUEL KANT

passes on;¹ Schopenhauer calls the *Critique* "the most important work in German literature," and considers any man a child until he has understood Kant;² Spencer could not understand Kant, and for precisely that reason, perhaps, fell a little short of the fullest philosophic stature. To adapt Hegel's phrase about Spinoza: to be a philosopher, one must first have been a Kantian.

Therefore let us become Kantians at once. But it cannot be done at once, apparently; for in philosophy, as in politics, the longest distance between two points is a straight line. Kant is the last person in the world whom we should read on Kant. Our philosopher is like and unlike Jehovah; he speaks through clouds, but without the illumination of the lightning-flash. He disdains examples and the concrete; they would have made his book too long, he argued.³ (So abbreviated, it contains some 800 pages, nevertheless.) Only professional philosophers were expected to read him; and these would not need illustrations. Yet when Kant

gave the MS. of the *Critique* to his friend Herz, a man much versed in speculation, Herz returned it half read, saying he feared insanity if he went on with it. What shall we do with such a philosopher?

Let us approach him deviously and cautiously, beginning at a safe and respectful distance from him; let us start at various points on the circumference of the subject, and then grope our way towards that subtle center where the most difficult of all philosophies has its secret and its treasure.

I. FROM VOLTAIRE TO KANT

The road here is from theoretical reason without religious faith, to religious faith without theoretical reason. Voltaire means the Enlightenment, the Encyclopedia, the Age of Reason. The warm enthusiasm of Francis Bacon had inspired all Europe (except Rousseau) with unquestioning faith in the power of science and logic to solve at last all problems, and illustrate the "infinite perfectibility" of man. Condorcet, in prison, wrote his *Historical Tableau of the Progress of the Human Spirit* (1793), which spoke the sublime faith of the eighteenth century in knowledge and reason, and asked no other key to Utopia than uni-

versal education. Even the steady Germans had their *Aufklärung*, their rationalist, Christian Wolff, and their hopeful Lessing. And the excitable Parisians of the Revolution dramatized this apotheosis of the intellect by worshipping the "Goddess of Reason,"—impersonated by a charming grisette.

In Spinoza this faith in reason had begotten a magnificent structure of geometry and logic: the universe was a mathematical system, and could be described *a priori*, by pure deduction from accepted axioms. In Hobbes the rationalism of Bacon had become an uncompromising atheism and materialism; again nothing was to exist but "atoms and the void." From Spinoza to Diderot the wrecks of faith lay in the wake of advancing reason: one by one the old dogmas disappeared; the Gothic cathedral of medieval belief, with its delightful details and grotesques, collapsed; the ancient God fell from his throne along with the bourbons, heaven faded into mere sky, and hell became only an emotional expression. Helvetius and Holbach made atheism so fashionable in the salons of France that even the clergy took it up; and La Mettrie went to peddle it in Germany, under the auspices of Prussia's king. When, in 1784, Lessing shocked

Jacobi by announcing himself a follower of Spinoza, it was a sign that faith had reached its nadir, and that Reason was triumphant.

David Hume, who played so vigorous a role in the Enlightenment assault on supernatural belief, said that when reason is against a man, he will soon turn against reason. Religious faith and hope, voiced in a hundred thousand steeples rising out of the soil of Europe everywhere, were too deeply rooted in the institutions of society and in the heart of man, to permit their ready surrender to the hostile verdict of reason; it was inevitable that this faith and this hope, so condemned, would question the competence of this judge, and would call for an examination of reason as well as of religion. What was this intellect that proposed to destroy with a syllogism the beliefs of thousands of years and billions of men? Was it infallible? Or was it one human organ like any other, with strictest limits to its functions and its powers? The time had come to judge this judge, to examine this ruthless Revolutionary Tribunal that was dealing out death so lavishly to every ancient hope. The time had come for a critique of reason.

2. FROM LOCKE TO KANT

The way had been prepared for such an examination by the work of Locke, Berkeley and Hume; and yet, apparently, their results too were hostile to religion.

John Locke (1632-1704) had proposed to apply to psychology the inductive tests and methods of Francis Bacon; in his great *Essay on Human Understanding* (1689) reason, for the first time in modern thought, had turned in upon itself, and philosophy had begun to scrutinize the instrument which it so long had trusted. This introspective movement in philosophy grew step by step with the introspective novel as developed by Richardson and Rousseau; just as the sentimental and emotional color of *Clarissa Harlowe* and *La Nouvelle Héloïse* had its counterpart in the philosophic exaltation of instinct and feeling above intellect and reason.

How does knowledge arise? Have we, as some good people suppose, innate ideas, as, for example, of right and wrong, and God,—ideas inherent in the mind from birth, prior to all experience? Anxious theologians, worried lest belief in the Deity should disappear because God had not yet appeared in any telescope, had thought that faith and morals might be

strengthened, if their central and basic ideas were shown to be inborn in every normal soul. But Locke, good Christian though he was, ready to argue most eloquently for "The Reasonableness of Christianity," could not accept these suppositions; he announced, quietly, that all our knowledge comes from experience and through our senses—that "there is nothing in the mind except what was first in the senses." The mind is at birth a clean sheet, a *tabula rasa*; and sense-experience writes upon it in a thousand ways, until sensation begets memory and memory begets ideas. All of which seemed to lead to the startling conclusion that since only material things can affect our sense, we know nothing but matter, and must accept a materialistic philosophy. If sensations are the stuff of thought, the hasty argued, matter must be the material of mind.

Not at all, said Bishop George Berkeley (1684-1753); this Lockian analysis of knowledge proves rather that matter does not exist except as a form of mind. It was a brilliant idea—to refute materialism by the simple expedient of showing that we know of no such thing as matter; in all Europe only a Gaelic imagination could have conceived this metaphysical magic.

14 THE PHILOSOPHY OF IMMANUEL KANT

But see how obvious it is, said the Bishop: has not Locke told us that all our knowledge is derived from sensation? Therefore all our knowledge of anything is merely our sensations of it, and the ideas derived from these sensations. A "thing" is merely a bundle of perceptions—i.e., classified and interpreted sensations. You protest that your breakfast is much more substantial than a bundle of perceptions; and that a hammer that teaches you carpentry through your thumb has a most magnificent materiality. But your breakfast is at first nothing but a congeries of sensations of sight and smell and touch; and then of taste; and then of internal comfort and warmth. Likewise, the hammer is a bundle of sensations of color, size, shape, weight, touch, etc.; its reality for you is not in its materiality, but in the sensations that come from your thumb. If you had no senses, the hammer would not exist for you at all; it might strike your dead thumb forever and yet win from you not the slightest attention. It is only a bundle of sensations, or a bundle of memories; it is a condition of the mind. All matter, so far as we know it, is a mental condition; and the only reality that we know directly is mind. So much for materialism.

But the Irish Bishop had reckoned without the Scotch sceptic, David Hume (1711-1776), who at the age of twenty-six shocked all Christendom with his highly heretical *Treatise on Human Nature*,—one of the classics and marvels of modern philosophy. We know the mind, said Hume, only as we know matter: by perception, though it be in this case internal. Never do we perceive any such entity as the "mind;" we perceive merely separate ideas, memories, feelings, etc. The mind is not a substance, an organ that has ideas; it is only an abstract name for the series of ideas; the perceptions, memories and feelings *are* the mind. There is no observable "soul" behind the processes of thought. The result appeared to be that Hume had as effectually destroyed mind as Berkeley had destroyed matter. Nothing was left; and philosophy found itself in the midst of ruins of its own making. No wonder that a wit advised the abandonment of the controversy, saying: "No matter, never mind."

But Hume was not content to destroy orthodox religion by dissipating the concept of soul; he proposed also to destroy science by dissolving the concept of law. Science and philosophy alike, since Bruno and Galileo, had

been making much of natural law, of "necessity" in the sequence of effect upon cause; Spinoza had reared his majestic metaphysics upon this proud conception. But observe, said Hume, that we never perceive causes, or laws; we perceive events and sequences, and *infer* causation and necessity; a law is not an eternal and necessary decree to which events are subjected, but merely a mental summary and shorthand of our kaleidoscopic experience; we have no guarantee that the sequences hitherto observed will re-appear unaltered in future experience. "Law" is an observed *custom* in the sequence of events; but there is no "necessity" in custom. Only mathematical formulae have necessity—they alone are inherently and unchangeably true; and this merely because such formulae are tautological—the predicate is already contained in the subject; " $3 \times 3 = 9$ " is an eternal and necessary truth only because " 3×3 " and "9" are one and the same thing differently expressed; the predicate adds nothing to the subject. Science, then, must limit itself strictly to mathematics and direct experiment; it cannot trust to unverified deduction from "laws." "When we run through libraries, persuaded of these principles," writes our uncanny

sceptic, "what havoc must we make! If we take in our hands any volume of school metaphysics, for instance, let us ask, 'Does it contain any abstract reasoning concerning quantity or number?' No. 'Does it contain any experimental reasoning concerning matter of fact and existence?' No. Commit it then to the flames, for it can contain nothing but sophistry and illusion."⁴

Imagine how the ears of the orthodox tingled at these words. Here the epistemological tradition—the inquiry into the nature, sources, and validity of knowledge—had ceased to be a support to religion; the sword with which Bishop Berkeley had slain the dragon of materialism had turned against the immaterial mind and the immortal soul; and in the turmoil science itself had suffered severe injury. No wonder that when Immanuel Kant, in 1755, read a German translation of the works of David Hume, he was shocked by these results, and was roused, as he said, from the "dogmatic slumber" in which he had assumed without question the essentials of religion and the bases of science. Were both science and faith

⁴Quoted in Royce, *The Spirit of Modern Philosophy*, Boston, 1892; p. 98.

18 THE PHILOSOPHY OF IMMANUEL KANT

to be surrendered to the sceptic? What could be done to save them?

3. FROM ROUSSEAU TO KANT

To the argument of the Enlightenment, that reason makes for materialism, Berkeley had essayed the answer that matter does not exist. But this had led, in Hume, to the retort that by the same token mind does not exist either. Another answer was possible—that reason is no final test. There are some theoretical conclusions against which our whole being rebels; we have no right to presume that these demands of our nature must be stifled at the dictates of a logic which is after all but the recent construction of a frail and deceptive part of us. How often our instincts and feelings push aside the little syllogisms which would like us to behave like geometrical figures, and make love with mathematical precision! Sometimes, no doubt,—and particularly in the novel complexities and artificialities of urban life,—reason is the better guide; but in the great crises of life, and in the great problems of conduct and belief, we trust to our feelings rather than to our diagrams. If reason is against religion, so much the worse for reason!

Such, in effect, was the argument of Jean

Jacques Rousseau (1712-1778), who almost alone, in France, fought the materialism and atheism of the Enlightenment. What a fate for a delicate and neurotic nature, to have been cast amidst the robust rationalism and the almost brutal hedonism⁵ of the Encyclopedists! Rousseau had been a sickly youth, driven into brooding and introversion by his physical weakness and the unsympathetic attitude of his parents and teachers; he had escaped from the stings of reality into a hot-house world of dreams, where the victories denied him in life and love could be had for the imagining. His *Confessions* reveal an unreconciled complex of the most refined sentimentality with an obtuse sense of decency and honor; and through it all an unsullied conviction of his moral superiority.⁶

In 1749 the Academy of Dijon offered a prize for an essay on the question, "Has the Progress of the Sciences and the Arts Contributed to Corrupt, or to Purify, Morals?" Rousseau's essay won the prize. Culture is much more of an evil than a good, he argued, with all the intensity and sincerity of one who, finding cul-

⁵The doctrine that all behavior is motivated by the pursuit of pleasure.

⁶Cf. *Confessions*, bk. X; vol. II, p. 184.

ture out of his reach, proposed to prove it worthless. Consider the frightful disorders which printing has produced in Europe. Wherever philosophy arises, the moral health of the nation decays. "It was even a saying among the philosophers themselves that since learned men had appeared, honest men were nowhere to be found." "I venture to declare that a state of reflection is contrary to nature; and that a thinking man" (an "intellectual," as we would now say) "is a depraved animal." It would be better to abandon our over-rapid development of the intellect, and to aim rather at training the heart and the affections. Education does not make a man good, it only makes him clever—usually for mischief. Instinct and feeling are more trustworthy than reason.

In his famous novel, *La Nouvelle Héloïse* (1761), Rousseau illustrated at great length the superiority of feeling to intellect; sentimentality became the fashion among the ladies of the aristocracy, and among some of the men; France was for a century watered with literary, and then with actual, tears; and the great movement of the European intellect in the eighteenth century gave way to the romantic emotional literature of 1789-1848. The cur-

rent carried with it a strong revival of religious feeling; the ecstasies of Chateaubriand's *Génie du Christianisme* (1802) were merely an echo of the "Confessions of Faith of the Savoyard Vicar" which Rousseau included in his epochal essay on education—*Emile* (1762). The argument of the "Confession" was briefly this: that though reason might be against belief in God and immortality, feeling was overwhelmingly in their favor; why should we not trust in instinct here, rather than yield to the despair of an avid scepticism?

When Kant read *Emile* he omitted his daily walk under the linden trees, in order to finish the book at once. It was an event in his life to find here another man who was groping his way out of the darkness of atheism, and who boldly affirmed the priority of feeling over theoretical reason in these supra-sensual concerns. Here at last was the second half of the answer to irreligion; now finally all the scoffers and doubters would be scattered. To put these threads of argument together, to unite the ideas of Berkeley and Hume with the feelings of Rousseau, to save religion from reason,

22 THE PHILOSOPHY OF IMMANUEL KANT

and yet at the same time to save science from scepticism—this was the mission of Immanuel Kant.

But who was Immanuel Kant?

II. KANT HIMSELF

Kant was born at Königsberg, Prussia, in 1724. Except for a short period of tutoring in a nearby village, this quiet little professor, who loved so much to lecture on the geography and ethnology of distant lands, never left his native city. He came of a poor family, which had left Scotland some hundred years before Immanuel's birth. His mother was a Pietist,—i.e., a member of a religious sect which, like the Methodists of England, insisted on the full strictness and rigor of religious practice and belief. Our philosopher was so immersed in religion from morning to night that on the one hand he experienced a reaction which led him to stay away from church all through his adult life; and on the other hand he kept to the end the sombre stamp of the German Puritan, and felt, as he grew old, a great longing to preserve for himself and the world the essentials, at least, of the faith so deeply inculcated in him by his mother.

But a young man growing up in the age of Frederick and Voltaire could not insulate himself from the sceptical current of the time.

Kant was profoundly influenced even by the men whom later he aimed to refute, and perhaps most of all by his favorite enemy, Hume; we shall see later the remarkable phenomenon of a philosopher transcending the conservatism of his maturity and returning in almost his last work, and at almost the age of seventy, to a virile liberalism that would have brought him martyrdom had not his age and his fame protected him. Even in the midst of his work of religious restoration we hear, with surprising frequency, the tones of another Kant whom we might almost mistake for a Voltaire. Schopenhauer thought it "not the least merit of Frederick the Great, that under his government Kant could develop himself, and dared to publish his *Critique of Pure Reason*. Hardly under any other government would a salaried professor" (therefore, in Germany, a government employee) "have ventured such a thing. Kant was obliged to promise the immediate successor of the great King that he would write no more."⁷ It was in appreciation of this freedom that Kant dedicated the *Critique* to Zedlitz, Frederick's far-sighted and progressive Minister of Education.

⁷*The World as Will and Idea*, London, 1883; vol. ii, p. 133.

In 1755 Kant began his work as private lecturer at the University of Königsberg. For fifteen years he was left in this lowly post; twice his applications for a professorship were refused. At last, in 1770, he was made professor of logic and metaphysics. After many years of experience as a teacher, he wrote a text-book of pedagogy, of which he used to say that it contained many excellent precepts, none of which he had ever applied. Yet he was perhaps a better teacher than writer; and two generations of students learned to love him. One of his practical principles was to attend most to those pupils who were of middle ability; the dunces, he said, were beyond all help, and the geniuses would help themselves.

Nobody expected him to startle the world with a new metaphysical system; to startle anybody seemed the very last crime that this timid and modest professor would commit. He himself had no expectations in that line; at the age of forty-two he wrote: "I have the fortune to be a lover of metaphysics; but my mistress has shown me few favors as yet."⁸ He spoke in those days of the "bottomless abyss of

⁸Quoted by Royce, *The Spirit of Modern Philosophy*; Boston, 1892; p. 120.

metaphysics," and of metaphysics as "a dark ocean without shores or lighthouse," strewn with many a philosophic wreck.⁹ He could even attack the metaphysicians as those who dwelt on the high towers of speculation, "where there is usually a great deal of wind."¹⁰ He did not foresee that the greatest of all metaphysical tempests was to be of his own blowing.

During these quiet years his interests were rather physical than metaphysical. He wrote on planets, earthquakes, fire, winds, ether, volcanoes, geography, ethnology, and a hundred other things of that sort, not usually confounded with metaphysics. His *Theory of the Heavens* (1755) proposed something very similar to the nebular hypothesis of Laplace, and attempted a mechanical explanation of all sidereal motion and development. All the planets, Kant thought, have been or will be inhabited; and those that are farthest from the sun, having had the longest period of growth, have probably a higher species of intelligent organisms than any yet produced on our planet. His *Anthropology* (put together in 1798 from the lectures of a life-time) suggested the possibility of the

⁹Quoted by Paulsen, *Immanuel Kant*; New York, 1910; p. 82.

¹⁰*Ibid.*, p. 56.

animal origin of man. Kant argued that if the human infant, in early ages when man was still largely at the mercy of wild animals, had cried as loudly upon entering the world as it does now, it would have been found out and devoured by beasts of prey; that in all probability, therefore, man was very different at first from what he had become under civilization. And then Kant went on, subtly: "How nature brought about such a development, and by what causes it was aided, we know not. This remark carries us a long way. It suggests the thought whether the present period of history, on the occasion of some great physical revolution, may not be followed by a third, when an orang-outang or a chimpanzee would develop the organs which serve for walking, touching, speaking, into the articulated structure of a human being, with a central organ for the use of understanding, and gradually advance under the training of social institutions." Was this use of the future tense Kant's cautiously indirect way of putting forth his view of how man had really developed from the beast?¹¹

So we see the slow growth of this simple

¹¹So Wallace suggests: *Kant*, Philadelphia, 1882; p. 115.

little man, hardly five feet tall, modest, shrinking, and yet containing in his head, or generating there, the most far-reaching revolution in modern philosophy. Kant's life, says one biographer, passed like the most regular of regular verbs. "Rising, coffee-drinking, writing, lecturing, dining, walking," says Heine,—“each had its set time. And when Immanuel Kant, in his grey coat, cane in hand, appeared at the door of his house, and strolled towards the small avenue of linden trees which is still called 'The Philosopher's Walk,' the neighbors knew it was exactly half-past-three by the clock. So he promenaded up and down, during all seasons; and when the weather was gloomy, or the grey clouds threatened rain, his old servant Lampe was seen plodding anxiously after, with a large umbrella under his arm, like a symbol of Prudence.”

He was so frail in physique that he had to take severe measures to regimen himself; he thought it safer to do this without a doctor; and so he lived to the age of eighty. At seventy he wrote an essay "On the Power of the Mind to Master the Feeling of Illness by Force of Resolution." One of his favorite principles was to breathe only through the nose, especially

when out-doors; hence, in autumn, winter and spring, he would permit no one to talk to him on his daily walks; better silence than a cold. He applied philosophy even to holding up his stockings—by bands passing up into his trousers' pockets, where they ended in springs contained in small boxes.¹² He thought everything out carefully before acting; and therefore remained a bachelor all his life long. Twice he thought of offering his hand to a lady; but he reflected so long that in one case the lady married a bolder man, and in the other the lady removed from Königsberg before the philosopher could make up his mind. Perhaps he felt, like Nietzsche, that marriage would hamper him in the honest pursuit of truth; "a married man," Talleyrand used to say, "will do anything for money." And Kant had written, at twenty-two, with all the fine enthusiasm of omnipotent youth: "I have already fixed upon the line which I am resolved to keep. I will enter on my course, and nothing shall prevent me from pursuing it."¹³

And so he persevered, through poverty and obscurity, sketching and writing and rewriting

¹²Introd. to Kant's *Critique of Practical Reason*; London, 1909; p. xlii.

¹³Wallace, p. 100.

30 THE PHILOSOPHY OF IMMANUEL KANT

his *magnum opus* for almost fifteen years; finishing it only in 1781, when he was fifty-seven years old. Never did a man mature so slowly; and then again, never did a book so startle and upset the philosophic world.

III. THE CRITIQUE OF PURE REASON¹⁴

What is meant by this title? *Critique* is not precisely a criticism, but a critical analysis; Kant is not attacking "pure reason," except, at the end, to show its limitations; rather he hopes to show its possibility, and to exalt it above the impure knowledge which comes to us through the distorting channels of sense. For "pure" reason is to mean knowledge that does not come through our senses, but is independent of all sense experience; knowledge belonging to us by the inherent nature and structure of the mind.

At the very outset, then, Kant flings down a challenge to Locke and the English school: knowledge is not all derived from the senses. Hume thought he had shown that there is no soul, and no science; that our minds are but

¹⁴A word about what to read. Kant himself is hardly intelligible to the beginner, because his thought is insulated with a bizarre and intricate terminology (hence the paucity of direct quotations in this essay). Perhaps the simplest introduction is Wallace's *Kant*, in the Blackwood Philosophical Classics. Heavier and more advanced is Paulsen's *Immanuel Kant*. Chamberlain's *Immanuel Kant* (2 vols.; New York, 1914) is interesting but erratic and digressive. A good criticism of Kant may be found in Schopenhauer's *World as Will and Idea*; vol. ii, pp. 1-159.

32 THE PHILOSOPHY OF IMMANUEL KANT

our ideas in procession and association; and our certainties but probabilities in perpetual danger of violation. These false conclusions, says Kant, are the result of false premises: you assume that all knowledge comes from "separate and distinct" sensations; naturally these cannot give you necessity, or invariable sequences of which you may be forever certain; and naturally you must not expect to "see" your soul, even with the eyes of the internal sense. Let us grant that absolute certainty of knowledge is impossible if all knowledge comes from sensation, from an independent external world which owes us no promise of regularity of behavior. But what if we have knowledge that is independent of sense-experience, knowledge whose truth is certain to us even before experience—*a priori*? Then absolute truth, and absolute science, would become possible, would it not? Is there such absolute knowledge? This is the problem of the first *Critique*. "My question is, what we can hope to achieve with reason, when all the material and assistance of experience are taken away."¹⁵ The *Critique* becomes a detailed bibliography of thought, an examination of the origin and evolution of con-

¹⁵*Critique of Pure Reason*, pref. p. xxiv.

cepts, an analysis of the inherited structure of the mind. This, as Kant believes, is the entire problem of metaphysics. "In this book I have chiefly aimed at completeness; and I venture to maintain that there ought not to be one single metaphysical problem that has not been solved here, or to the solution of which the key at least has not here been supplied."¹⁶ *Exegi monumentum aere perennius!* With such egotism nature spurs us on to creation.

The *Critique* comes to the point at once. "Experience is by no means the only field to which our understanding can be confined. Experience tells us what is, but not that it must be necessarily what it is and not otherwise. It therefore never gives us any really general truths; and our reason, which is particularly anxious for that class of knowledge, is roused by it rather than satisfied. General truths, which at the same time bear the character of an inward necessity, must be independent of experience,—clear and certain in themselves."¹⁷ That is to say, they must be true no matter what our later experience may be; true even *before* experience; true *a priori*. "How far we can advance independently of all experience, in *a priori* knowl-

¹⁶*Ibid.*, p. xxiii. ¹⁷*Ibid.*, p. 1

edge, is shown by the brilliant example of mathematics."¹⁸ Mathematical knowledge is necessary and certain; we cannot conceive of future experience violating it. We may believe that the sun will "rise" in the west to-morrow, or that some day, in some conceivable asbestos world, fire will not burn stick; but we cannot for the life of us believe that two times two will ever make anything else than four. Such truths are true before experience; they do not depend on experience past, present, or to come. Therefore they are absolute and necessary truths; it is inconceivable that they should ever become untrue. But whence do we get this character of absoluteness and necessity? Not from experience; for experience gives us nothing but separate sensations and events, which may alter their sequence in the future.¹⁹ These truths derive their necessary character from the inherent structure of our minds, from the natural and inevitable manner in which our minds must operate. For the mind of man (and here at last is the great thesis of Kant)

¹⁸P. 4.

¹⁹"Radical empiricism" (James, Dewey, etc.) enters the controversy at this point, and argues against both Hume and Kant, that experience gives us relations and sequences as well as sensations and events.

is not passive wax upon which experience and sensation write their absolute and yet whimsical will; nor is it a mere abstract name for the series or group of mental states; it is an active organ which moulds and co-ordinates sensations into ideas, an organ which transforms the chaotic multiplicity of experience into the ordered unity of thought.

But how?

1. TRANSCENDENTAL ESTHETIC

The effort to answer this question, to study the inherent structure of the mind, or the innate laws of thought, is what Kant calls "transcendental philosophy," because it is a problem transcending sense-experience. "I call knowledge transcendental which is occupied not so much with objects, as with our *a priori* concepts of objects,"²⁰—with our modes of correlating our experience into knowledge. There are two grades or stages in this process of working up the raw material of sensation into the finished product of thought. The first stage is the co-ordination of sensations by applying to them the forms of perception—space and time; the second stage is the co-ordination of the perceptions so developed, by applying

²⁰*Critique of Pure Reason*, p. 10.

to them the forms of conception—the “categories” of thought. Kant, using the word *esthetic* in its original and etymological sense, as connoting sensation or feeling, calls the study of the first of these stages “Transcendental Esthetic;” and using the word *logic* as meaning the science of the forms of thought, he calls the study of the second stage “Transcendental Logic.” These are terrible words, which will take meaning as the argument proceeds; once over this hill, the road to Kant will be comparatively clear.

Now just what is meant by sensations and perceptions?—and how does the mind change the former into the latter? By itself a sensation is merely the awareness of a stimulus; we have a taste on the tongue, an odor in the nostrils, a sound in the ears, a temperature on the skin, a flash of light on the retina, a pressure on the fingers: it is the raw crude beginning of experience; it is what the infant has in the early days of its groping mental life; it is not yet knowledge. But let these various sensations group themselves about an object in space and time—say this apple; let the odor in the nostrils, and the taste on the tongue, the light on the retina, the shape-

revealing pressure on the fingers and the hand, unite and group themselves about this "thing": and there is now an awareness not so much of a stimulus as of a specific object; there is a perception. Sensation has passed into knowledge.

But again, was this passage, this grouping, automatic? Did the sensations of themselves, spontaneously and naturally, fall into a cluster and an order, and so become perception? Yes, said Locke and Hume; not at all, says Kant.

For these varied sensations come to us through varied channels of sense, through a thousand "afferent nerves" that pass from skin and eye and ear and tongue into the brain; what a medley of messengers they must be as they crowd into the chambers of the mind, calling for attention! No wonder Plato spoke of "the rabble of the senses." And left to themselves, they remain rabble, a chaotic "manifold," pitifully impotent, waiting to be ordered into meaning and purpose and power. As readily might the messages brought to a general from a thousand sectors of the battle-line weave themselves unaided into comprehension and command. No; there is a law-giver for this mob, a directing and co-ordinating power that

does not merely receive, but takes these atoms of sensation and moulds them into sense.

Observe, first, that not all of the messages are accepted. A myriad forces play upon your body at this moment; a storm of stimuli beats down upon the nerve-endings which, amoeba-like, you put forth to experience the external world: but not all that call are chosen; only those sensations are selected that can be moulded into perceptions suited to your present purpose, or that bring those imperious messages of danger which are always relevant. The clock is ticking, and you do not hear it; but that same ticking, not louder than before, will be heard at once if your purpose wills it so. The mother asleep at her infant's cradle is deaf to the turmoil of life about her; but let the little one move, and the mother gropes her way back to waking attention like a diver rising hurriedly to the surface of the sea. Let the purpose be addition, and the stimulus "two and three" brings the response, "five;" let the purpose be multiplication, and the same stimulus, the same auditory sensations, "two and three," bring the response, "six." Association of sensations or ideas is not merely by contiguity in space or time, nor by similarity, nor

by recency, frequency or intensity of experience; it is above all determined by the purpose of the mind. Sensations and thoughts are servants, they await our call, they do not come unless we need them. There is an agent of selection and direction that uses them and is their master. In addition to the sensations and the ideas there is the *mind*.

This agent of selection and co-ordination, Kant thinks, uses first of all two simple methods for the classification of the material presented to it: the sense of space, and the sense of time. As the general arranges the messages brought him according to the place from which they come, and the time at which they were written, and so finds an order and a system for them all; so the mind allocates its sensations in space and time, attributes them to this object here or that object there, to this present time or to that past. Space and time are not things perceived, but modes of perception, ways of putting sense into sensation; space and time are organs of perception.

They are *a priori*, because all ordered experience involves and presupposes them. Without them, sensations could never grow into perceptions. They are *a priori* because it is incon-

ceivable that we should ever have any future experience that will not also involve them. And because they are *a priori*, their laws, which are the laws of mathematics, are *a priori*, absolute and necessary, world without end. It is not merely probable, it is certain that we shall never find a straight line that is not the shortest distance between two points. Mathematics, at least, is saved from the dissolvent scepticism of David Hume.

Can all the sciences be similarly saved? Yes, if their basic principle, the law of causality—that a given cause must *always* be followed by a given effect—can be shown, like space and time, to be so inherent in all the processes of understanding that no future experience can be conceived that would violate or escape it. Is causality, too, *a priori*, an indispensable prerequisite and condition of all thought?

2. TRANSCENDENTAL ANALYTIC

So we pass from the wide field of sensation and perception to the dark and narrow chamber of thought; from “transcendental esthetic” to “transcendental logic;” and first to the naming and analysis of those elements in our thought which are not so much given to the mind by perception as given to perception by

the mind; those levers which raise the "perceptual" knowledge of objects into the "conceptual" knowledge of relationships, sequences, and laws; those tools of the mind which refine experience into science. Just as perceptions arranged sensations around objects in space and time, so conception arranges perceptions (objects and events) about the ideas of cause, unity, reciprocal relation, necessity, contingency, etc.; these and other "categories" are the structure into which perceptions are received, and by which they are classified and moulded into the ordered concepts of thoughts. These are the very essence and character of the mind; mind is the co-ordination of experience.

And here again observe the activity of this mind that was, to Locke and Hume, mere "passive wax" under the blows of sense-experience. Consider a system of thought like Aristotle's; is it conceivable that this almost cosmic ordering of data should have come by the automatic, anarchistic spontaneity of the data themselves? See this magnificent card-catalogue in the library, intelligently ordered into sequence by human purpose. Then picture all these card-cases thrown upon the floor, all these cards scattered pell-mell into riotous disorder. Can

you now conceive these scattered cards pulling themselves up, Münchhausen-like, from their disarray, passing quietly into their alphabetical and topical places in their proper boxes, and each box into its fit place in the rack,—until all should be order and sense and purpose again? What a miracle-story these sceptics have given us after all!

Sensation is unorganized stimulus, perception is organized sensation, conception is organized perception, science is organized knowledge, wisdom is organized life: each is a greater degree of order, and sequence, and unity. Whence this order, this sequence, this unity? Not from the things themselves; for they are known to us only by sensations that come through a thousand channels at once in disorderly multitude; it is our purpose that put order and sequence and unity upon this importunate lawlessness; it is ourselves, our personalities, our minds, that bring light upon these seas. Locke was wrong when he said, "There is nothing in the intellect except what was first in the senses;" Leibniz was right when he added,— "nothing, except the intellect itself." "Perceptions without conceptions," says Kant, "are blind." If perceptions wove themselves auto-

matically into ordered thought, if mind were not an active effort hammering out order from chaos, how could the same experience leave one man mediocre, and in a more active and tireless soul be raised to the light of wisdom and the beautiful logic of truth?

The world, then, has order, not of itself, but because the thought that knows the world is itself an ordering, the first stage in that classification of experience which at last is science and philosophy. The laws of thought are also the laws of things, for things are known to us only through this thought that must obey these laws, since it and they are one; in effect, as Hegel was to say, the laws of logic and the laws of nature are one, and logic and metaphysics merge. The generalized principles of science are necessary because they are ultimately laws of thought that are involved and presupposed in every experience, past, present, and to come. Science is absolute, and truth is everlasting.

3. TRANSCENDENTAL DIALECTIC

Nevertheless, this certainty, this absoluteness, of the highest generalizations of logic and science, are, paradoxically, limited and relative: limited strictly to the field of actual experience,

and relative strictly to our human mode of experience. For if our analysis has been correct, the world as we know it is a construction, a finished product, almost—one might say—a manufactured article, to which the mind contributes as much by its moulding forms as the thing contributes by its stimuli. (So we perceive the top of the table as round, whereas our sensation is of an ellipse.) The object as it appears to us is a phenomenon, an appearance, perhaps very different from the external object before it came within the ken of our senses; what that original object was we can never know; the “thing-in-itself” may be an object of thought or inference (a “noumenon”), but it cannot be experienced,—for in being experienced it would be changed by its passage through sense and thought. “It remains completely unknown to us what objects may be by themselves and apart from the receptivity of our senses. We know nothing but our manner of perceiving them; that manner being peculiar to us, and not necessarily shared by every being, though, no doubt, by every human being.”²¹ The moon as known to us is merely

²¹*Critique*, p. 37. If Kant had not added the last clause, his argument for the necessity of knowledge would have fallen.

a bundle of sensations (as Hume saw), unified (as Hume did not see) by our native mental structure through the elaboration of sensations into perceptions, and of these into conceptions or ideas; in result, the moon is *for us* merely our ideas.²² Not that Kant ever doubts the existence of "matter" and the external world; but he adds that we know nothing certain about them except that they exist. Our detailed knowledge is about their appearance, their phenomena, about the sensations which we have of them. Idealism does not mean, as the man in the street thinks, that nothing exists outside the perceiving subject; but that a goodly part of every object is created by the forms of perception and understanding: we know the object as transformed into idea; what it is before being so transformed we cannot know. Science, after all, is naive; it supposes that it is dealing with things in themselves, in their full-blooded external and uncorrupted reality; philosophy is a little more sophisticated, and realizes that the whole material of science consists of sensations, perceptions and conceptions, rather than of things. "Kant's

²²So John Stuart Mill, with all his English tendency to realism, was driven at last to define matter as merely "a permanent possibility of sensations."

greatest merit," says Schopenhauer, "is the distinction of the phenomenon from the thing-itself."²³

It follows that any attempt, by either science or religion, to say just what the ultimate reality is, must fall back into mere hypothesis; "the understanding can never go beyond the limits of sensibility."²⁴ Such transcendental science loses itself in "antinomies," and such transcendental theology loses itself in "paralogisms." It is the cruel function of "transcendental dialectic" to examine the validity of these attempts of reason to escape from the enclosing circle of sensation and appearance into the unknowable world of things "in themselves."

Antinomies are the insoluble dilemmas born of a science that tries to overleap experience. So, for example, when knowledge attempts to decide whether the world is finite or infinite in space, thought rebels against either supposition: beyond any limit, we are driven to conceive something further, endlessly; and yet infinity is itself inconceivable. Again: did the world have a beginning in time? We cannot conceive eternity; but then, too, we cannot conceive any point in the past without feeling

²³*The World as Will and Idea*; vol. ii, p. 7.

²⁴*Critique*, p. 215.

at once that before that, something was. Or has that chain of causes which science studies, a beginning, a First Cause? Yes, for an endless chain is inconceivable; no, for a first cause uncaused is inconceivable as well. Is there any exit from these blind alleys of thought? There is, says Kant, if we remember that space, time and cause are modes of perception and conception, which must enter into all our experience, since they are the web and structure of experience; these dilemmas arise from supposing that space, time and cause are external things independent of perception. We shall never have any experience which we shall not interpret in terms of space and time and cause; but we shall never have any philosophy if we forget that these are not things, but modes of interpretation and understanding.

So with the paralogisms of "rational" theology—which attempts to prove by theoretical reason that the soul is an incorruptible substance, that the will is free and above the law of cause and effect, and that there exists a "necessary being," God, as the presupposition of all reality. Transcendental dialectic must remind theology that substance and cause and necessity are finite categories, modes of arrangement and classification which the mind

applies to sense-experience, and reliably valid only for the phenomena that appear to such experience; we cannot apply these conceptions to the noumenal (or merely inferred and conjectural) world. Religion cannot be proved by theoretical reason.

So the first *Critique* ends. One could well imagine David Hume, 'uncannier Scot than Kant himself, viewing the results with a sardonic smile. Here was a tremendous book, eight hundred pages long; weighted beyond bearing, almost, with ponderous terminology; proposing to solve all the problems of metaphysics, and incidentally to save the absoluteness of science and the essential truth of religion. What had the book really done? It had destroyed the naive world of science, and limited it, if not in degree, certainly in scope,—and to a world confessedly of mere surface and appearance, beyond which it could issue only in farcical "antinomies"; so science was "saved"! The most eloquent and incisive portions of the book had argued that the objects of faith—a free and immortal soul, a benevolent creator—could never be proved by reason: so religion was "saved"! No wonder the priests of Germany protested madly against

this salvation, and revenged themselves by calling their dogs Immanuel Kant!²⁵

And no wonder that Heine compared the little professor of Königsberg with the terrible Robespierre; the latter had merely killed a king, and a few thousand Frenchmen—which a German might forgive; but Kant, said Heine, had killed God, had undermined the most precious arguments of theology. "What a sharp contrast between the outer life of this man, and his destructive, world-convulsing thoughts! Had the citizens of Königsberg surmised the whole significance of those thoughts, they would have felt a more profound awe in the presence of this man than in that of an executioner, who merely slays human beings. But the good people saw in him nothing but a professor of philosophy; and when at the fixed hour he sauntered by, they nodded a friendly greeting, and set their watches."²⁶

Was this caricature, or revelation?

²⁵Wallace, p. 82.

²⁶Heine. *Prose Miscellanies*. Philadelphia. 1876: p. 146.

IV. THE CRITIQUE OF PRACTICAL REASON

If religion cannot be based on science and theology, on what then? On morals. The basis in theology is too insecure; better that it should be abandoned, even destroyed; faith must be put beyond the reach or realm of reason. But therefore the moral basis of religion must be absolute, not derived from questionable sense-experience or precarious inference; not corrupted by the admixture of fallible reason; it must be derived from the inner self by direct perception and intuition. We must find a universal and necessary ethic; *a priori* principles of morals as absolute and certain as mathematics. We must show that "pure reason can be practical; i. e., can of itself determine the will independently of anything empirical,"²⁷ that the moral sense is innate, and not derived from experience. The moral imperative which we need as the basis of religion must be an absolute, a categorical, imperative.

Now the most astounding reality in all our experience is precisely our moral sense, our inescapable feeling, in the face of temptation, that this or that is wrong. We may yield; but

²⁷*Critique of Practical Reason*, p. 31.

the feeling is there nevertheless. *Le matin je fais des projets, et le soir je fais des sottises*;²⁸ but we know that they are *sottises*, and we resolve again. What is it that brings the bite of remorse, and the new resolution? It is the categorical imperative in us, the unconditional command of our conscience, to "act as if the maxim of our action were to become by our will a universal law of nature."²⁹ We know, not by reasoning, but by vivid and immediate feeling, that we must avoid behavior which, if adopted by all men, would render social life impossible. Do I wish to escape from a predicament by a lie? But "while I can will the lie, I can by no means will that lying should be a universal law. For with such a law there would be no promises at all."³⁰ Hence the sense in me, that I must not lie, even if it be to my advantage. Prudence is hypothetical; its motto is, Honesty when it is the best policy; but the moral law in our hearts is unconditional and absolute.

And an action is good not because it has good results, or because it is wise, but because it is done in obedience to this inner sense of duty, this moral law that does not come from

²⁸"In the morning I make good resolutions; in the evening I commit follies."

²⁹*Practical Reason*, p. 139. ³⁰*Ibid.*, p. 19.

our personal experience, but legislates imperiously and *a priori* for all our behavior, past, present, and future. The only thing unqualifiedly good in this world is a good will—the will to follow the moral law, regardless of profit or loss for ourselves. Never mind your happiness; do your duty. “Morality is not properly the doctrine how we may make ourselves happy, but how we may make ourselves worthy of happiness.”³¹ Let us seek the happiness of others; but for ourselves, perfection—whether it bring us happiness or pain.³² To achieve perfection in yourself and happiness in others, “so act as to treat humanity, whether in thine own person or in that of another, in every case as an end, never only as a means”:³³—this too, as we directly feel, is part of the categorical imperative. Let us live up to such a principle, and we shall soon create an ideal community of rational beings; to create it we need only act as if we already belonged to it; we must apply the perfect law in the imperfect state. It is a hard ethic, you say,—this placing of duty above beauty, of morality above

³¹*Ibid.*, p. 227.

³²*Preface to the Metaphysical Elements of Ethics.*

³³*Metaphysics of Morals*, London, 1909; p. 47.

happiness; but only so can we cease to be beasts, and begin to be gods.

Notice, meanwhile, that this absolute command to duty proves at last the freedom of our wills; how could we ever have conceived such a notion as duty if we had not felt ourselves free? We cannot prove this freedom by theoretical reason; we prove it by feeling it directly in the crisis of moral choice. We feel this freedom as the very essence of our inner selves, of the "pure Ego"; we feel within ourselves the spontaneous activity of a mind moulding experience and choosing goals. Our actions, once we initiate them, seem to follow fixed and invariable laws, but only because we perceive their results through sense, which clothes all that it transmits in the dress of that causal law which our minds themselves have made. Nevertheless, we are beyond and above the laws we make in order to understand the world of our experience; each of us is a center of initiative force and creative power. In a way which we feel but cannot prove, each of us is free.

And again, though we cannot prove, we feel, that we are deathless. We perceive that life is not like those dramas so beloved by the people—in which every villain is punished, and

every act of virtue meets with its reward; we learn anew every day that the wisdom of the serpent fares better here than the gentleness of the dove, and that any thief can triumph if he steals enough. If mere worldly utility and expediency were the justification of virtue, it would not be wise to be too good. And yet, knowing all this, having it flung into our faces with brutal repetition, we still feel the command to righteousness, *we know that we ought to do the inexpedient good*. How could this sense of right survive if it were not that in our hearts we feel this life to be only a part of life, this earthly dream only an embryonic prelude to a new birth, a new awakening; if we did not vaguely know that in that later and longer life the balance will be redressed, and not one cup of water given generously but shall be returned a hundred-fold?

Finally, and by the same token, there is a God. If the sense of duty involves and justifies belief in rewards to come, "the postulate of immortality...must lead to the supposition of the existence of a cause adequate to this effect; in other words, it must postulate the existence of God."³⁴ This again is no proof by "reason"; the moral sense, which has to

³⁴*Practical Reason*, p. 220.

do with the world of our actions, must have priority over that theoretical logic which was developed only to deal with sense-phenomena. Our reason leaves us free to believe that behind the thing-in-itself there is a just God; our moral sense commands us to believe it. Rousseau was right: above the logic of the head is the feeling in the heart; the heart has reasons of its own, as Pascal said, which the head can never understand.

V. ON RELIGION AND REASON

Does this appear trite, and timid, and conservative? But it was not so; on the contrary, this bold denial of "rational" theology, this frank reduction of religion to moral faith and hope, aroused all the orthodox of Germany to protests. To face this "forty-parson-power" (as Byron would have called it) required more courage than one usually associates with the name of Kant.

That he was brave enough appeared in all clarity when he published, at sixty-six, his *Critique of Judgment*, and, at sixty-nine, his *Religion within the Limits of Pure Reason*. In the earlier of these books Kant returns to the discussion of that argument from design which, in the first *Critique*, he had rejected as an insufficient proof of the existence of God. He begins by correlating design and beauty; the beautiful, he thinks, is anything which reveals symmetry and unity of structure, as if it had been designed by intelligence. He observes in passing (and Schopenhauer here helped himself to a good deal of his theory of art) that the contemplation of symmetrical design always gives us a disinterested pleasure; and

that "an interest in the beauty of nature for its own sake is always a sign of goodness."³⁵ Many objects in nature show such beauty, such symmetry and unity as almost to drive us to the notion of supernatural design. But on the other hand, says Kant, there are also in nature many instances of waste and chaos, of useless repetition and multiplication; nature preserves life, but at the cost of how much suffering and death! The appearance of external design, then, is not a conclusive proof of Providence. The theologians who use the idea so much should abandon it, and the scientists who have abandoned it should use it; it is a magnificent clue, and leads to hundreds of revelations. For there is design, undoubtedly; but it is internal design, the design of the parts by the whole; and if science will interpret the parts of an organism in terms of their meaning for the whole, it will have an admirable balance for that other heuristic principle—the mechanical conception of life—which also is fruitful for discovery, but which, alone, can never explain the growth of even a blade of grass.

The essay on religion is a remarkable production for a man of sixty-nine; it is perhaps the boldest of all the books of Kant. Since

³⁵*Critique of Judgment*, sect. 29.

religion must be based not on the logic of theoretical reason but on the practical reason of the moral sense, it follows that any Bible or revelation must be judged by its value for morality, and cannot itself be the judge of a moral code. Churches and dogmas have value only in so far as they assist the moral development of the race. When mere creeds or ceremonies usurp priority over moral excellence as a test of religion, religion has disappeared. The real church is a community of people, however scattered and divided, who are united by devotion to the common moral law. It was to establish such a community that Christ lived and died; it was this real church which he held up in contrast to the ecclesiasticism of the Pharisees. But another ecclesiasticism has almost overwhelmed this noble conception. "Christ has brought the kingdom of God nearer to earth; but he has been misunderstood; and in place of God's kingdom the kingdom of the priest has been established among us."³⁶ Creed and ritual have again replaced the good life; and instead of men being bound together by religion, they are divided into a thousand sects; and all manner of "pious

³⁶Quoted in Chamberlain, *Immanuel Kant*; vol. 1, p. 510.

nonsense" is inculcated as "a sort of heavenly court service by means of which one may win through flattery the favor of the ruler of heaven."³⁷—Again, miracles cannot prove a religion, for we can never quite rely on the testimony which supports them; and prayer is useless if it aims at a suspension of the natural laws that hold for all experience. Finally, the nadir of perversion is reached when the church becomes an instrument in the hands of a reactionary government; when the clergy, whose function it is to console and guide a harassed humanity with religious faith and hope and charity, are made the tools of theological obscurantism and political oppression.

The audacity of these conclusions lay in the fact that precisely this had happened in Prussia. Frederick the Great had died in 1786, and had been succeeded by Frederick William II, to whom the liberal policies of his predecessor seemed to smack unpatriotically of the French Enlightenment. Zedlitz, who had been Minister of Education under Frederick, was dismissed; and his place was given to a Pietist, Wöllner, whom Frederick had denounced as "a treacherous and intriguing priest;" who divided his time between alchemy and Rosicrucian

³⁷In Paulsen, 366.

mysteries, and climbed to power by offering himself as "an unworthy instrument" to the new monarch's policy of restoring the orthodox faith by compulsion.³⁸ Wöllner issued, in 1788, a decree which forbade any teaching, in school or university, that deviated from the orthodox form of Lutheran Protestantism; he established a strict censorship over all forms of publication, and ordered the discharge of every teacher suspected of any heresy. Kant was at first left unmolested, because he was an old man, and—as one royal adviser said—only a few people read him, and these did not understand him. But the essay on religion was too intelligible; and though it rang true with religious fervor, it revealed too strong a strain of Voltaire to pass the new censorship. The *Berliner Monatsschrift*, which had planned to publish the essay, was ordered to suppress it.

Kant acted now with a vigor and courage hardly credible in a man who had almost completed three score years and ten. He sent the essay to some friends at Jena, and through them had it published by the press of the university there. Jena was outside of Prussia, under the jurisdiction of that same liberal

³⁸*Encyclopedia Brittanica*, article "Frederick William II."

Duke of Weimar who was then caring for Goethe. The result was that in 1794 Kant received an eloquent cabinet order from the Prussian King, which read as follows: "Our highest person has been greatly displeased to observe how you misuse your philosophy to undermine and destroy many of the most important and fundamental doctrines of the Holy Scriptures and of Christianity. We demand of you immediately an exact account, and expect that in future you will give no such cause of offense, but rather that, in accordance with your duty, you will employ your talents and authority so that our paternal purpose may be more and more attained. If you continue to oppose this order you may expect unpleasant consequences."³⁹ Kant replied that every scholar should have the right to form independent judgments on religious matters, and to make his opinions known; but that during the reign of the present king he would preserve silence. Some biographers who can be very brave by proxy, have condemned him for this concession; but let us remember that Kant was seventy, that he was frail in health, and not fit for a fight; and that he had already spoken his message to the world.

³⁹In Paulsen, p. 49.

VI. ON POLITICS AND ETERNAL PEACE

The Prussian government might have pardoned Kant's theology, had he not been guilty of political heresies as well. Three years after the accession of Frederick William II, the French Revolution had set all the thrones of Europe trembling. At a time when most of the teachers in the Prussian universities had rushed to the support of legitimate monarchy, Kant, sixty-five years young, hailed the Revolution with joy; and with tears in his eyes said to his friends: "Now I can say like Simeon, 'Lord, let now Thy servant depart in peace; for mine eyes have seen Thy salvation.'"⁴⁰

He had published, in 1784, a brief exposition of his political theory under the title of "The Natural Principle of the Political Order considered in connection with the Idea of a Universal Cosmopolitical History"; the title itself was a considerable portion of the essay. Kant begins by recognizing, in that strife of each against all which had so shocked Hobbes, nature's method of developing the hidden capacities of life; struggle is the indispensable accompaniment of progress. If men were en-

⁴⁰Wallace, p. 40.

tirely social, man would stagnate; a certain alloy of individualism and competition is required to make the human species survive and grow. "Without qualities of an unsocial kind ...men might have led an Arcadian shepherd life in complete harmony, contentment, and mutual love; but in that case all their talents would have forever remained hidden in their germ." (Kant, therefore, was no slavish follower of Rousseau.) "Thanks be then to nature for this unsociableness, for this envious jealousy and vanity, for this insatiable desire for possession and for power...Man wishes concord; but nature knows better what is good for his species; and she wills discord, in order that man may be impelled to a new exertion of his powers, and to the further development of his natural capacities."

The struggle for existence, then, is not altogether an evil. Nevertheless, men soon perceive that it must be restricted within certain limits, and regulated by rules, customs, and laws; hence the origin and development of civil society. But now "the same unsociableness which forced men into society becomes again the cause of each commonwealth's assuming the attitude of uncontrolled freedom in its external relations,— i. e., as one state in

relation to other states; and consequently, any one state must expect from any other the same sort of evils as formerly oppressed individuals and compelled them to enter into a civil union regulated by law."⁴¹ It is time that nations, like men, should emerge from the wild state of nature, and contract to keep the peace. The whole meaning and movement of history is the ever greater restriction of pugnacity and violence, the continuous enlargement of the area of peace. "The history of the human race, viewed as a whole, may be regarded as the realization of a hidden plan of nature to bring about a political constitution, internally and externally perfect, as the only state in which all the capacities implanted by her in mankind can be fully developed."⁴² If there is no such progress, the labors of successive civilizations are like those of Sisyphus, who again and again "up the high hill heaved a huge round stone," only to have it roll back as it was almost at the top. History would be then nothing more than an endless and circuitous folly; "and we might suppose, like the Hindu, that the earth is a place for the expiation of old and forgotten sins."⁴³

⁴¹*Eternal Peace and Other Essays*; Boston, 1914; p. 14.

⁴²*Ibid.*, p. 19. ⁴³P. 58

The essay on "Eternal Peace" (published in 1795, when Kant was seventy-one) is a noble development of this theme. Kant knows how easy it is to laugh at the phrase; and under his title he writes: "These words were once put by a Dutch inn-keeper on his sign-board as a satirical inscription, over the representation of a church-yard" cemetery.⁴⁴ Kant had before complained, as apparently every generation must, that "our rulers have no money to spend on public education...because all their resources are already placed to the account of the next war."⁴⁵ The nations will not really be civilized until all standing armies are abolished.—The audacity of this proposal stands out when we remember that it was Prussia itself which, under the father of Frederick the Great, had been the first to establish conscription.—"Standing armies excite states to outrival one another in the number of their armed men, which has no limit. Through the expense occasioned thereby, peace becomes in the long run more oppressive than a short war; and standing armies are thus the cause of aggressive wars undertaken in order to get rid of this burden."⁴⁶ For in time of war the army would support

⁴⁴P. 68. ⁴⁵P. 21. ⁴⁶P. 71.

itself on the country, by requisitioning, quartering, and pillaging; preferably in the enemy's territory, but if necessary, in one's own land; even this would be better than supporting it out of government funds.

Much of this militarism, in Kant's judgment, was due to the expansion of Europe into America and Africa and Asia; with the resultant quarrels of the thieves over their new booty. "If we compare the barbarian instances of inhospitality...with the inhuman behavior of the civilized, and especially the commercial, states of our continent, the injustice practiced by them even in their first contact with foreign lands and peoples fills us with horror; the mere visiting of such peoples being regarded by them as equivalent to a conquest. America, the negro lands, the Spice Islands, the Cape of Good Hope, etc., on being discovered, were treated as countries that belonged to nobody; for the aboriginal inhabitants were reckoned as nothing....And all this has been done by nations who make a great ado about their piety, and who, while drinking up iniquity like water, would have themselves regarded as the very elect of the orthodox faith."⁴⁷—The old fox of Königsberg was not

⁴⁷P. 68.

silenced yet!

Kant attributed this imperialistic greed to the oligarchical constitution of European states; the spoils went to a select few, and remained substantial even after division. If democracy were established, and all shared in political power, the spoils of international robbery would have to be so subdivided as to constitute a resistible temptation. Hence the "first definitive article in the conditions of Eternal Peace" is this: "The civil constitution of every state shall be republican, and war shall not be declared except by a plebiscite of all the citizens."⁴⁸ When those who must do the fighting have the right to decide between war and peace, history will no longer be written in blood. "On the other hand, in a constitution where the subject is not a voting member of the state, and which is therefore not republican, the resolution to go to war is a matter of the smallest concern in the world. For in this case the ruler, who, as such, is not a mere citizen, but the owner of the state, need not in the least suffer personally by war, nor has he to sacrifice his pleasures of the table or the chase, or his pleasant palaces, court festivals, or the like.

⁴⁸Pp. 76-77.

He can, therefore, resolve for war from insignificant reasons, as if it were but a hunting expedition; and as regards its propriety, he may leave the justification of it without concern to the diplomatic corps, who are always too ready to give their services for that purpose."⁴⁹ How contemporary truth is!

The apparent victory of the Revolution over the armies of reaction in 1795 led Kant to hope that republics would now spring up throughout Europe, and that an international order would arise based upon a democracy without slavery and without exploitation, and pledged to peace. After all, the function of government is to help and develop the individual, not to use and abuse him. "Every man is to be respected as an absolute end in himself; and it is a crime against the dignity that belongs to him as a human being, to use him as a mere means for some external purpose."⁵⁰ This too is part and parcel of that categorical imperative without which religion is a hypocritical farce. Kant therefore calls for equality: not of ability, but of opportunity for the development and application of ability; he rejects all prerogatives of birth and class, and

⁴⁹*Ibid.*

⁵⁰In Paulsen, p. 340.

traces all hereditary privilege to some violent conquest in the past. In the midst of obscurantism and reaction and the union of all monarchical Europe to crush the Revolution, he takes his stand, despite his seventy years, for the new order, for the establishment of democracy and liberty everywhere. Never had old age so bravely spoken with the voice of youth.

But he was exhausted now; he had run his race and fought his fight. He withered slowly into a childlike senility that came at last to be a harmless insanity: one by one his sensibilities and his powers left him; and in 1804, aged seventy-nine, he died, quietly and naturally, like a leaf falling from a tree.

VII. CRITICISM AND ESTIMATE

And now how does this complex structure of logic, metaphysics, psychology, ethics, and politics stand today, after the philosophic storms of a century have beaten down upon it? It is pleasant to answer that much of the great edifice remains; and that the "critical philosophy" represents an event of permanent importance in the history of thought. But many details and outworks of the structure have been shaken.

First, then, is space a mere "form of sensibility," having no objective reality independent of the perceiving mind? Yes and no. Yes: for space is an empty concept when not filled with perceived objects; "space" merely means that certain objects are, for the perceiving mind, at such and such a position, or distance, with reference to other perceived objects; and no external perception is possible except of objects in space; space then is assuredly a "necessary form of the external sense." And no: for without doubt, such spatial facts as the annual elliptic circuit of sun by earth, though statable only by a mind, are independent of any perception whatever; the deep and dark blue ocean rolled on before Byron told it to,

and after he had ceased to be. Nor is space a "construct" of the mind through the co-ordination of spaceless sensations; we perceive space directly through our simultaneous perception of different objects and various points—as when we see an insect moving across a still background. Likewise: time as a sense of before and after, or a measurement of motion, is of course subjective, and highly relative; but a tree will age, wither and decay whether or not the lapse of time is measured or perceived. The truth is that Kant was too anxious to prove the subjectivity of space, as a refuge from materialism; he feared the argument that if space is objective and universal, God must exist in space, and be therefore spatial and material. He might have been content with the critical idealism which shows that all reality is known to us primarily as our sensations and ideas. The old fox bit off more than he could chew.⁵¹

⁵¹The persistent vitality of Kant's theory of knowledge appears in its complete acceptance by so matter-of-fact a scientist as the late Charles P. Steinmetz: "All our sense-perceptions are limited by, and attached to, the conceptions of time and space. Kant, the greatest and most critical of all philosophers, denies that time and space are the product of experience, but shows them to be categories—conceptions in which our minds clothe the sense perceptions." (The honorable scientist is slightly confused here.) "Modern physics has

He might well have contented himself, too, with the relativity of scientific truth, without straining towards that mirage, the absolute. Recent studies like those of Pearson in England, Mach in Germany, and Henri Poincaré in France, agree rather with Hume than with Kant: all science, even the most rigorous mathematics, is relative in its truth. Science itself is not worried about the matter; a high degree of probability contents it. Perhaps, after all, "necessary" knowledge is not necessary.

The great achievement of Kant is to have shown, once for all, that the external world is known to us only as sensation; and that the mind is no mere helpless *tabula rasa*, the inactive victim of sensation, but a positive agent, selecting and reconstructing experience as experience arrives. We can make subtractions from this accomplishment without injuring its essential greatness. We may smile, with Schopenhauer, at the exact baker's dozen of categories, so prettily boxed into triplets, and then stretched and contracted and interpreted de-

come to the same conclusion in the relativity theory, that absolute space and absolute time have no existence, but time and space exist only as far as things or events fill them; that is, they are forms of perception."--Address at the Unitarian Church, Schenectady, 1923.

viously and ruthlessly to fit and surround all things.⁵² And we may even question whether these categories, or interpretive forms of thought, are innate, existing before sensation and experience; perhaps so in the individual, as Spencer conceded, though acquired by the race; and then, again, probably acquired even by the individual: the categories may be grooves of thought, habits of perception and conception, gradually produced by sensations and perceptions automatically arranging themselves,—first in disorderly ways, then, by a kind of natural selection of forms of arrangement, in orderly and adaptive and illuminating ways. It is memory that classifies and interprets sensations into perceptions, and perceptions into ideas; but memory is an accretion. That unity of the mind which Kant thinks native (the “transcendental unity of apperception”) is acquired—and not by all; and can be lost as well as won,—as in amnesia, or alternating personality, or insanity. Concepts are an achievement, not a gift.

The nineteenth century dealt rather hardly with Kant's ethics, his theory of an innate, *a priori*, absolute moral sense. The philosophy of evolution suggested irresistibly that the

⁵²*Op. cit.*, vol. ii, p. 23.

sense of duty is a social deposit in the individual; the content of conscience is acquired, though the vague disposition to social behavior is innate. The moral self, the social man, is no "special creation" coming mysteriously from the hand of God, but the late product of a leisurely evolution. Morals are not absolute; they are a code of conduct more or less haphazardly developed for group survival, and varying with the nature and circumstances of the group: a people hemmed in by enemies, for example, will consider as immoral that zestful and restless individualism which a nation youthful and secure in its wealth and isolation will condone as a necessary ingredient in the exploitation of natural resources and the formation of national character. No action is good in itself, as Kant supposes.⁵³ His pietistic youth, and his hard life of endless duty and infrequent pleasure, gave him a moralistic bent; he came at last to advocate duty for duty's sake, and so fell unwittingly into the arms of Prussian absolutism.⁵⁴ There is something of a severe Scotch Calvinism in this opposition of duty to happiness; Kant continues Luther and the Stoic Reformation, as Voltaire

⁵³*Practical Reason*, p. 31.

⁵⁴Cf. Prof. Dewey: *German Philosophy and Politics*.

continues Montaigne and the Epicurean Renaissance. He represented a stern reaction against the egoism and hedonism in which Helvetius and Holbach had formulated the life of their reckless era, very much as Luther had reacted against the luxury and laxity of Mediterranean Italy. But after a century of reaction against the absolutism of Kant's ethics, we find ourselves again in a welter of urban sensualism and immorality, of ruthless individualism untempered with social conscience or aristocratic honor; and perhaps the day will soon come when a disintegrating civilization will welcome again the Kantian call to duty.

The marvel in Kant's philosophy is his vigorous revival, in the second *Critique*, of those religious ideas of God, freedom, and immortality, which the first *Critique* had apparently destroyed. "In Kant's works," says Nietzsche's critical friend, Paul Ree, "you feel as though you were at a country fair. You can buy from him anything you want—freedom of the will and captivity of the will, idealism and a refutation of idealism, atheism and the good Lord. Like a juggler out of an empty hat, Kant draws out of the concept of duty a God, immortality, and freedom,—to the great sur-

prise of his readers."⁵⁵ Schopenhauer too takes a fling at the derivation of immortality from the need of reward: Kant's virtue, which at first bore itself so bravely towards happiness, loses its independence later, and holds out its hand for a tip."⁵⁶ The great pessimist believes that Kant was really a sceptic who, having abandoned belief himself, hesitated to destroy the faith of the people, for fear of the consequences to public morals. "Kant discloses the groundlessness of speculative theology, and leaves popular theology untouched, nay even establishes it in a nobler form as a faith based upon moral feeling. This was afterwards distorted by the philosophasters into rational apprehension and consciousness of God, etc....; while Kant, as he demolished old and revered errors, and knew the danger of doing so, rather wished through the moral theology merely to substitute a few weak temporary supports, so that the ruin might not fall upon him, but that he might have time to escape."⁵⁷ So too Heine, in what is no doubt an intentional caricature, represents Kant, after having destroyed religion, going out for a walk

⁵⁵In Untermann, *Science and Revolution*, Chicago, 1905; p. 81.

⁵⁶In Paulsen, p. 317.

⁵⁷*The World as Will and Idea*, vol. ii, p. 129.

with his servant Lampe, and suddenly perceiving that the old man's eyes are filled with tears. "Then Immanuel Kant has compassion and shows that he is not only a great philosopher, but also a good man; and half kindly, half ironically, he speaks: 'Old Lampe must have a God or else he cannot be happy, says the practical reason; for my part, the practical reason may, then, guarantee the existence of God.'"⁵⁸ If these interpretations were true we should have to adapt the title of a section of the first *Critique* and call the entire second *Critique* a Transcendental Anesthetic. And no doubt Kant made a mistake when he sought to secure religion from attack by proposing, as he puts it, "to make faith independent of knowledge."⁵⁹ What a comfort for old maids forever!—and no aid at all to any masculine belief.

But these adventurous reconstructions of the inner Kant need not be taken too seriously. The fervor of the essay on "Religion within the Limits of Pure Reason" indicates a sincerity too intense to be questioned, and the attempt to change the base of religion from theology to morals, from creeds to conduct,

⁵⁸Quoted by Paulsen, p. 8.

⁵⁹*Ibid.*, p. 7.

could have come only from a profoundly religious mind. "It is indeed true," he wrote to Moses Mendelssohn in 1766, "that I think many things with the clearest conviction,... which I never have the courage to say; but I will never say anything which I do not think."⁶⁰ Naturally, a long and obscure treatise like the great *Critique* lends itself to rival interpretations; one of the first reviews of the book (written by Reinhold a few years after the *Critique* appeared) said as much as we can say today: "The *Critique of Pure Reason* has been proclaimed by the dogmatists as the attempt of a sceptic who undermines the certainty of all knowledge;—by the sceptics as a piece of arrogant presumption that undertakes to erect a new form of dogmatism upon the ruins of previous systems;—by the supernaturalists as a subtly plotted artifice to displace the historical foundations of religion, and to establish naturalism without polemic;—by the naturalists as a new prop for the dying philosophy of faith;—by the materialists as an idealistic contradiction of the reality of matter;—by the spiritualists as an unjustifiable limitation of all reality to the corporeal world, concealed

⁶⁰In Paulsen, p. 53.

under the name of the domain of experience."⁶¹ And in truth the glory of the book lay in its appreciation of all these points of view; and to an intelligence as keen as Kant's own, it might well appear that he had really reconciled them all, and fused them into such a unity of complex truth as philosophy had not seen in all its history before.

As to his influence, all the philosophic thought of the nineteenth century revolved about his speculations. After Kant, all Germany began to talk metaphysics: Schiller and Goethe studied him; Beethoven quoted with admiration his famous words about the two wonders of life—"the starry heavens above, the moral law within"; and Fichte, Schelling, Hegel and Schopenhauer produced in rapid succession great systems of thought reared upon the idealism of the old Königsberg sage. It was in these balmy days of German metaphysics that Jean Paul Richter wrote: "God has given to the French the land, to the English the sea, to the Germans the empire of the air." Kant's criticism of reason, and his exaltation of feeling, prepared for the voluntarism of Schopenhauer and Nietzsche, the intuitionism of Bergson, and the pragmatism of William

⁶¹*Ibid.*, p. 114.

James; his identification of the laws of thought with the laws of reality gave to Hegel a whole system of philosophy; and his unknowable "thing-in-itself" influenced Spencer more than Spencer knew. Much of the obscurity of Carlyle is traceable to his attempt to allegorize the already obscure thought of Goethe and Kant—that diverse religions and philosophies are but the changing garments of one eternal truth. Caird and Green and Wallace and Watson and Bradley and many others in England owe their inspiration to the first *Critique*; and even the wildly innovating Nietzsche takes his epistemology from the "great Chinaman of Königsberg" whose static ethics he so excitedly condemns. After a century of struggle between the idealism of Kant, variously reformed, and the materialism of the Enlightenment, variously redressed, the victory seems to lie with Kant. Even the great materialist Helvetius wrote, paradoxically: "Men, if I may dare say it, are the creators of matter."⁶² Philosophy will never again be so naïve as in her earlier and simpler days; she must always be different, hereafter, and profounder, because Kant lived.

⁶²In Chamberlain, vol. i, p. 86.

VIII. A NOTE ON HEGEL

Not very long ago it was the custom for historians of philosophy to give to the immediate successors of Kant—to Fichte, Schelling, and Hegel—as much honor and space as to all his predecessors in modern thought from Bacon and Descartes to Voltaire and Hume. Our perspective today is a little different, and we enjoy perhaps too keenly the invective leveled by Schopenhauer at his successful rivals in the competition for professorial posts. By reading Kant, said Schopenhauer, “the public was compelled to see that what is obscure is not always without significance.” Fichte and Schelling took advantage of this, and excogitated magnificent spider-webs of metaphysics. “But the height of audacity in serving up pure nonsense, in stringing together senseless and extravagant mazes of words, such as had previously been known only in madhouses, was finally reached in Hegel, and became the instrument of the most bare-faced general mystification that has ever taken place, with a result which will appear fabulous to posterity, and

will remain as a monument to German stupidity." (63) Is this fair?

Georg Wilhelm Friedrich Hegel was born at Stuttgart in 1770. His father was a subordinate official in the department of finances of the state of Württemberg; and Hegel himself grew up with the patient and methodical habits of those civil servants whose modest efficiency has given Germany the best-governed cities in the world. The youth was a tireless student: he made full analyses of all the important books he read, and copied out long passages. True culture, he said, must begin with resolute self-effacement; as in the Pythagorean system of education, where the pupil, for the first five years, was required to keep his peace.

His studies of Greek literature gave him an enthusiasm for Attic culture which remained with him when almost all other enthusiasms had died away. "At the name of Greece," he wrote, "the cultivated German finds himself at home. Europeans have their religion from a further source, from the East; . . . but what is here, what is present,—science and art, all that makes life satisfying, and elevates and

⁶³Caird, *Hegel*, in the Blackwood Philosophical Classics; pp. 5-8. The biographical account follows Caird throughout.

adorns it—we derive, directly or indirectly, from Greece.” For a time he preferred the religion of the Greeks to Christianity; and he anticipated Strauss and Renan by writing a *Life of Jesus* in which Jesus was taken as the son of Mary and Joseph, and the miraculous element was ignored. Later he destroyed the book.

In politics too he showed a spirit of rebellion hardly to be suspected from his later sanctification of the *status quo*. While studying for the ministry at Tübingen, he and Schelling hotly defended the French Revolution, and went out early one morning to plant a Liberty Tree in the market-place. “The French nation, by the bath of its revolution,” he wrote, “has been freed from many institutions which the spirit of man has left behind like its baby shoes, and which therefore weighed upon it, as they still weigh upon others, like lifeless feathers.” It was in those hopeful days, “when to be young was very heaven,” that he flirted, like Fichte, with a kind of aristocratic socialism, and gave himself, with characteristic vigor, to the Romantic current in which all Europe was engulfed.

He was graduated from Tübingen in 1793

with a certificate stating that he was a man of good parts and character, well up in theology and philology, but with no ability in philosophy. He was poor now, and had to earn his bread by tutoring in Berne and Frankfort. These were his chrysalis years: while Europe tore itself into nationalist pieces, Hegel gathered himself together and grew. Then (1799) his father died, and Hegel, falling heir to some \$1,500, considered himself a rich man, and gave up tutoring. He wrote to his friend Schelling for advice as to where to settle, and asked for a place where there would be simple food, abundant books, and "ein gutes Bier." Schelling recommended Jena, which was a university town under the jurisdiction of that same Duke of Weimar who was the friend and patron of Goethe. At Jena Schiller was teaching history; Tieck, Novalis and the Schlegels were preaching romanticism; and Fichte and Schelling were propounding their philosophies. There Hegel came in 1801, and in 1803 became a teacher at the University.

He was still there in 1806 when Napoleon's victory over the Prussians threw the scholarly little city into confusion and terror. French soldiers invaded Hegel's home, and he took to

his heels like a philosopher, carrying with him the manuscript of his first important book, *The Phenomenology of Spirit*. For a while he was so destitute that Goethe told Knebel to lend him a few dollars to tide him over. Hegel wrote almost bitterly to Knebel: "I have made my guiding-star the Biblical saying, the truth of which I have learned by experience, Seek ye first food and clothing, and the kingdom of heaven shall be added unto you." For a while he edited a paper at Bamberg; then, in 1812, he became head of the gymnasium at Nürnberg. It was there, perhaps, that the stoic necessities of administrative work cooled the fires of romanticism in him, and made him, like Napoleon and Goethe, a classic vestige in a romantic age. And it was there that he wrote his *Logic* (1812-16), which captivated Germany by its unintelligibility, and won him the chair of philosophy at Heidelberg. At Heidelberg he wrote his immense *Encyclopedia of the Philosophical Sciences* (1817), on the strength of which he was promoted, in 1818, to the University of Berlin. From that time to the end of his life he ruled the philosophic world as indisputably as Goethe the world of literature, and Beethoven the realm of music. His birthday came on the day after

Goethe's; and proud Germany made a double holiday for them every year.

A Frenchman once asked Hegel to put his philosophy into one sentence; and he did not succeed so well as the monk who, asked to define Christianity while standing on one foot, said, simply, "Thou shalt love thy neighbor as thyself." Hegel preferred to answer in ten volumes; and when they were written and published, and all the world was talking about them, he complained that "only one man understands me, and even he does not."⁽⁶⁴⁾ Most of his writings, like Aristotle's, consist of his lecture-notes; or, worse, of the notes taken by students who heard his lectures. Only the *Logic* and the *Phenomenology* are from his hand, and these are masterpieces of obscurity, darkened by abstractness and condensation of style, by a weirdly original terminology, and by an over-careful modification of every statement with a Gothic wealth of limiting clauses. Hegel described his work as "an attempt to teach philosophy to speak in German."⁽⁶⁵⁾ He succeeded.

⁶⁴Ruthless critics, as we might have expected, challenge the authenticity of this story.

⁶⁵Wallace: *Prolegomena to the Logic of Hegel*, p. 10.

The *Logic* is an analysis not of methods of reasoning, but of the concepts used in reasoning. These Hegel takes to be the categories named by Kant—Being, Quality, Quantity, Relation, etc. It is the first business of philosophy to dissect these basic notions that are so bandied about in all our thinking. The most pervasive of them all is Relation; every idea is a group of relations; we can think of something only by relating it to something else, and perceiving its similarities and its differences. An idea without relations of any kind is empty; this is all that is meant by saying that "Pure Being and Nothing are the same": Being absolutely devoid of relations or qualities does not exist, and has no meaning whatever. This proposition led to an endless chain of witticisms which still breed; and it proved to be at once an obstacle and a lure to the study of Hegel's thought.

Of all relations, the most universal is that of contrast or opposition. Every condition of thought or of things—every idea and every situation in the world—leads irresistibly to its opposite, and then unites with it to form a higher or more complex whole. This "dialectical movement" runs through everything

that Hegel wrote. It is an old thought, of course, foreshadowed by Empedocles, and embodied in the "golden mean" of Aristotle, who wrote that "the knowledge of opposites is one." The truth (like an electron) is an organic unity of opposed parts. The truth of conservatism and radicalism is liberalism—an open mind and a cautious hand; the formation of our opinions on large issues is a decreasing oscillation between extremes; and in all debatable questions *veritas in medio stat*. The movement of evolution is a continuous development of oppositions, and their merging and reconciliation. Schelling was right—there is an underlying "identity of opposites"; and Fichte was right—thesis, antithesis and synthesis constitute the formula and secret of all development and all reality.

For not only do thoughts develop and evolve according to this "dialectical movement," but things do equally; every condition of affairs contains a contradiction which evolution must resolve by a reconciling unity. So, no doubt, our present social system secretes a self-corroding contradiction: the stimulating individualism required in a period of economic adolescence and unexploited resources, arouses,

in a later age, the aspiration for a co-operative commonwealth; and the future will see neither the present reality nor the visioned ideal, but a synthesis in which something of both will come together to beget a higher life. And that higher stage too will divide into a productive contradiction, and rise to still loftier levels of organization, complexity, and unity. The movement of thought, then, is the same as the movement of things; in each there is a dialectical progression from unity through diversity to diversity-in-unity. Thought and being follow the same law; and logic and metaphysics are one.

Mind is the indispensable organ for the perception of this dialectical process, and this unity in difference. The function of the mind, and the task of philosophy, is to discover the unity that lies potential in diversity; the task of ethics is to unify character and conduct; and the task of politics is to unify individuals into a state. The task of religion is to reach and feel that Absolute in which all opposites are resolved into unity, that great sum of being in which matter and mind, subject and object, good and evil, are one. God is the system of relationships in which all things move and

90 THE PHILOSOPHY OF IMMANUEL KANT

have their being and their significance. In man the Absolute rises to self-consciousness, and becomes the Absolute Idea—that is, thought realizing itself as part of the Absolute, and therefore transcending individual limitations and purposes, and catching, underneath the universal strife, the hidden harmony of all things. “Reason is the substance of the universe; . . . the design of the world is absolutely rational.”⁽⁶⁶⁾

Not that strife and evil are mere negative imaginings; they are real enough; but they are, in wisdom’s perspective, stages to fulfillment and the good. Struggle is the law of growth; character is built in the storm and stress of the world; and a man reaches his full height only through compulsions, responsibilities, and suffering. Even pain has its rationale; it is a sign of life and a stimulus to reconstruction. Passion also has a place in the reason of things: “nothing great in the world has been accomplished without passion”;⁽⁶⁷⁾ and even the egoistic ambitions of a Napoleon contribute unwittingly to the development of nations. Life is not made for happi-

⁶⁶Hegel: *Philosophy of History*, Bohn ed., pp. 9, 13.

⁶⁷*Ibid.*, p. 26.

ness, but for achievement. "The history of the world is not the theatre of happiness; periods of happiness are blank pages in it, for they are periods of harmony";⁽⁶⁸⁾ and this dull content is unworthy of a man. History is made only in those periods in which the contradictions of reality are being resolved by growth, as the hesitations and awkwardness of youth pass into the ease and order of maturity. History is a dialectical movement, almost a series of revolutions, in which people after people, and genius after genius, becomes the instrument of the Absolute. Great men are not so much begetters, as midwives, of the future; what they bring forth is mothered by the *Zeitgeist*, the Spirit of the Age. The genius merely places another stone on the pile, as others have done; "somehow his has the good fortune to come last, and when he places his stone the arch stands self-supported." "Such individuals had no consciousness of the general Idea they were unfolding; . . . but they had an insight into the requirements of the time—what was ripe for development. This was the very Truth for their age, for their world; the species next in

⁶⁸*Ibid.*, p. 28.

order, so to speak, and which was already formed in the womb of time.”⁶⁹)

Such a philosophy of history seems to lead to revolutionary conclusions. The dialectical process makes change the cardinal principle of life; no condition is permanent; in every stage of things there is a contradiction which only the “strife of opposites” can resolve. The deepest law of politics, therefore, is freedom—an open avenue to change; history is the growth of freedom, and the state is, or should be, freedom organized. On the other hand, the doctrine that “the real is rational” has a conservative color: every condition, though destined to disappear, has the divine right that belongs to it as a necessary stage in evolution; in a sense it is brutally true that “whatever is, is right.” And as unity is the goal of development, order is the first requisite of liberty.

If Hegel inclined, in his later years, to the conservative rather than to the radical implications of his philosophy, it was partly because the Spirit of the Time (to use his own historic phrase) was weary of too much change.

⁶⁹*Ibid.*, p. 31.

After the Revolution of 1830 he wrote: "Finally, after forty years of war and immeasurable confusion, an old heart might rejoice to see an end of it all, and the beginning of a period of peaceful satisfaction."⁽⁷⁰⁾ It was not quite in order that the philosopher of strife as the dialectic of growth should become the advocate of content; but at sixty a man has a right to ask for peace. Nevertheless, the contradictions in Hegel's thought were too deep for peace; and in the next generation his followers split with dialectical fatality into the "Hegelian Right" and the "Hegelian Left." Weisse and the younger Fichte found, in the theory of the real as rational, a philosophical expression of the doctrine of Providence, and justification for a politics of absolute obedience. Feuerbach, Moleschott, Bauer and Marx returned to the scepticism and "higher criticism" of Hegel's youth, and developed the philosophy of history into a theory of class struggles leading by a sort of Hegelian necessity, to "socialism inevitable." In place of the Absolute as determining history through the *Zeitgeist*, Marx offered mass movements and

94 THE PHILOSOPHY OF IMMANUEL KANT

economic forces as the basic causes of every fundamental change, whether in the world of things or in the life of thought. Hegel, the imperial professor, had hatched the socialistic eggs.

The old philosopher denounced the radicals as dreamers, and carefully hid away his early essays. He allied himself with the Prussian Government, blessed it as the latest expression of the Absolute, and basked in the sun of its academic favors. His enemies called him "the official philosopher." He began to think of the Hegelian system as part of the natural laws of the world; he forgot that his own dialectic condemned his thought to impermanence and decay. "Never did a philosophy assume such a lofty tone, and never were its royal honors so fully recognized and secured, as in 1830" in Berlin.⁽⁷¹⁾

But Hegel aged rapidly in those happy years. He became as absent-minded as a story-book genius; once he entered the lecture-room with only one shoe, having left the other, unnoticed, in the mud. When the cholera epidemic came to Berlin in 1831, his weakened body was one of the first to succumb to the contagion. After

⁷¹Paulsen, *Immanuel Kant*, p. 385.

only a day's illness he passed away suddenly and quietly in his sleep. Just as the space of a year had seen the birth of Napoleon, Beethoven and Hegel, so in the years from 1827 to 1832 Germany lost Goethe, Hegel, and Beethoven. It was the end of an epoch, the last fine effort of Germany's greatest age.

LIFE OF SHAKESPEARE
(As Seen by Georg Brandes)

LIFE OF SHAKESPEARE

The same year (1564) which saw the death of Michelangelo in Rome, saw the birth of William Shakespeare at Stratford-on-Avon. The great artist of the Italian Renaissance, the man who painted the ceiling of the Sistine Chapel, was replaced, as it were, by the great artist of the English Renaissance, the man who wrote King Lear.

In the light of what George Brandes has presented in his latest work, *Michelangelo Buonarroti*, there is a peculiar timeliness in going back to the Danish critic's *William Shakespeare, a Critical Study*, for a reexamination of the various factors that went to the making of what unquestionably is one of the most important books ever written on the great English dramatist. The Pocket Series affords its readers full opportunity to enjoy Shakespeare's works in the most compact form available. As a companion piece, a guide as it were, to places where light is still requisite for the complete understanding of the poet's purpose, Brandes's Shakespeare is invaluable. The purpose of the present writer is to condense his interpretation in such a manner that the main points are retained for the benefit of the readers of the Shakespeare series. In America the English translation of the work was published by the Macmillan Company.

I.

Georg Brandes, with that critical instinct that has distinguished his career for more than half a century, is not in agreement with all

that had been written before he himself took Shakespeare for his study. It was to be expected that his interpretation would differ from that of certain scholars who failed to make the man and his work a unit. It is here that Brandes reveals his art as an analytical student of human nature and its vagaries. We see Shakespeare before us as he must have been. His plays take on a new importance as their creator is placed in close juxtaposition to his labors. When Georg Brandes brought out his Shakespeare a quarter of a century ago the English literary world was astonished that a foreigner could perform such a task with such excellent results. Of course, the author of "Main Currents in Nineteenth Century Literature" already had an international reputation. But to venture where so many great men had already added to Shakespeare through acknowledged erudition and profound research, that was something only the most daring would have cared to attempt. The honors bestowed on Brandes when subsequent to the publication of his Shakespeare he revisited London are sufficient commentary as to what the English nation thought of his achievement.

That a biography of Shakespeare is difficult, but not impossible, is the assertion of Georg Brandes. All ordinary critical methods he finds to be useless for the purpose of such a biography. It is a curious fact that while Shakespeare died in 1616, the first biography of him, a few pages in length, dates from 1709. This is as though the first sketch of Goethe's life were not to be written until the year 1925.

"It has become the fashion," Brandes asserts, "to say, not without some show of justice, that we know next to nothing of Shakespeare's life. We do not know for certain either when he left Stratford or when he returned to Stratford from London. We do not know for certain whether he ever went abroad, ever visited Italy. We do not know the name of a single woman whom he loved during all his years in London. We do not know for certain to whom his Sonnets are addressed. We can see that, as he advanced in years, his prevailing mood became gloomier, but we do not know the reason. Later on, his temper seems to grow more serene, but we cannot tell why. We can form but tentative conjectures as to the order in which his works were produced, and can only with the greatest difficulty determine their approximate dates. We do not know what made him so careless of his fame as he seems to have been. We only know that he himself did not publish his dramatic works, and that he does not even mention them in his will."

And yet, avers Brandes, enthusiastic and indefatigable research has gradually brought to light a great number of indubitable facts, which furnish points of departure and guidance for an outline of the poet's life. There are documents, contracts, legal records; utterances of contemporaries, allusions to works of Shakespeare and to passages in them, quotations, fierce attacks, outbursts of spite and hatred, touching testimonies to his worth as a man and to the loveliness of his nature, evidence of the early recognition of his talent as an

actor, of his repute as a narrative poet, and of his popularity as a dramatist. There are, moreover, one or two diaries kept by contemporaries, and among others the account-book of an old theatrical manager and pawnbroker, who supplied the players with money and dresses, and who has carefully dated the production of many plays.

Passing over Shakespeare's boyhood in Stratford, his marriage to Anne Hathaway when only eighteen years of age, a woman eight years his senior, let us with Brandes follow the coming poet to London. The picture that the critic presents teems with interest: "The London to which Shakespeare came was a town of about 300,000 inhabitants. Its main streets had quite recently been paved, but were not yet lighted; it was surrounded with trenches, walls, and gates; it had high-gabled, red-roofed, two-story wooden houses, distinguished by means of projecting signs, from which they took their names,—houses in which benches did duty for chairs, and the floors were carpeted with rushes.

"The streets were usually thronged, not with wheel-traffic, for the first carriage was imported into England in this very reign, but with people on foot, on horseback, or in litters; while the Thames, still blue and clear, in spite of the already large consumption of coal, was alive with thousands of boats threading their way, amid the watermen's shrill cries of 'Eastward hoe!' or 'Westward hoe!' through bevvies of swans which put forth from, and returned

to, the green meadows and beautiful gardens bordering the stream."

II.

With such a picture of Shakespeare's London before us how much easier it is to visualize the England of the period. Brandes writes that it marked the country's development into a great Protestant power. With Elizabeth, Protestantism became a power in the world. The period of Shakespeare's arrival in London was momentous both in politics and religion.

"In 1585," writes Brandes, "Elizabeth opened war with Spain by sending her fleet to the Netherlands, with her favorite, Leicester, in command of the troops. In the beginning of the following year, Francis Drake, who in 1577-80 had for the first time circumnavigated the world, surprised and took San Domingo and Carthagen. The ship in which he had achieved his great voyage lay at anchor in the Thames as a memorial of the feat; it was often visited by Londoners, and no doubt by Shakespeare among them.

"In the years immediately following, the springtide of the national spirit burst into full bloom. Let us try to picture to ourselves the impression it must have made upon Shakespeare in the year 1587. On the 8th of February, 1587, Mary Stuart was executed at Fotheringay, and the breach between England and the Catholic world was thus made irreparable. On the 16th of February, England's noblest

knight and the flower of her chivalry, Sir Philip Sidney, the hero of Zuthpen, and the chief of the Anglo-Italian school of poets, was buried in St. Paul's Cathedral, with a pomp which gave to the event the character of a national solemnity. Sidney was an ideal representative of the aristocracy of the day. He possessed the widest humanistic culture, had studied Aristotle and Plato no less than geometry and astronomy, had traveled and seen the world, had read and thought and written, and was not only a scholar but a soldier to boot. As a cavalry officer he had saved the English army at Gravelines, and he had been the friend and patron of Giordano Bruno, the freest thinker of his time. The Queen herself was present at his funeral, and so, no doubt, was Shakespeare."

In this way Georg Brandes leads us onward and onward to a point where the reader soon finds himself fortified with an historical background that gives that scenic effect to Shakespeare's plays which, in the opinion of some leading actors, makes stage scenery a by-thing. The self-sufficiency of a Shakespeare plot is not a new dictum. As with the reading of most of these plays, so it lies entirely with the acting to infuse them with the necessary life. Apparently, it was the purpose of Brandes to make his Shakespeare so much of a living thing that the possible stage effects would visualize themselves unconsciously, as it were, before the reader. In the more than 700 pages of this work he has made what the London Academy termed at the time of its appearance

"an admirable and exhaustive survey of its subject, carried in accordance with modern method, and on the level of modern information." To which the *Saturday Review* added that "his book sums up, with masterly lucidity, all that scholarship has contrived to secure regarding the life and aims of the greatest of poets. It is well that we possess at last a translation so eminently satisfactory of what is certainly the best existing general view of the life and labors of Shakespeare."

This word, lucidity, takes on a special importance in any discussion of the works of Georg Brandes. His style, as a matter of fact, is the quintessence of lucidity. With him thinking and writing are twin companions, inseparable, bound with ties that make of the whole a thing clearly outlined. In his Shakespeare this is particularly so. Whether it is the question of the poet's relations with his aristocratic patrons and his fellow actors; a discussion of the plays and sonnets, the political background or the psychological intent, there is this sharply defined presentment which means so much to anyone desirous of obtaining the full effect of reading.

III.

It is a well-known tradition that Shakespeare was driven by dire necessity to hang about the theater after his arrival in London and hold the horses of those who had ridden to the play. The district was a remote and disreputable one, and swarmed with horse thieves.

Shakespeare won such favor as a horse-holder and was in such general demand, that he had to engage boys as assistants, who announced themselves as "Shakespeare's boys," a style and title, it is said, which long clung to them.

As actor and retoucher of old plays, Shakespeare early attracted attention. The company to which he became attached employed him to revise and furbish up the older pieces of their repertory. Brandes avers that in view of the time, theatrical productions as a whole were not classed as literature. Poets sold their works outright to the theater for such sums as five or ten pounds, or for a share in the receipts. As the interests of the theater demanded that plays should not be printed, in order that rival companies might not obtain possession of them, they remained in manuscript (unless pirated), and the players could accordingly do what they pleased with the text.

It is proved by several passages in contemporary writings that, partly as actor and partly as adapter of older plays, Shakespeare had, at the age of twenty-eight, made a certain name for himself. He had already become the object of envy and hatred. "On the other hand," writes Brandes, "we see that not only Shakespeare's genius, but his personal amiability, the loftiness and charm of his nature, disarmed even those who for one reason or another had spoken disparagingly of his activity. As Chettle, after printing Greene's attack, hastened to make public apology, so also Ben Jonson, to whose ill-will and cutting allusions

Shakespeare made no retort, became, in spite of an unconquerable jealousy, his true friend and admirer, and after his death spoke of him warmly in prose, and with enthusiasm in verse, in the noble eulogy prefixed to the First Folio. . .

"Between 1586 and 1592," Brandes declares further, "we lose all trace of Shakespeare. We know only that he must have been an active member of a company of players. It is not proved that he ever belonged to any other company than the Earl of Leicester's, which owned the Blackfriars, and afterwards the Globe theater."

Speaking of the theaters, in the City itself none were tolerated. The civic authorities regarded them with an unfriendly eye, and had banished them to the outskirts and across the Thames, together with the rough amusements with which they had to compete; cock-fighting and bear-baiting with dogs. There was as yet only one bridge across the Thames, the mighty London Bridge, situated not far from that which now bears the name. It was broad and lined with buildings; while on the tall gate-towers heads which had fallen on the block were almost always displayed. In its neighborhood lay Eastcheap, the street in which stood Falstaff's tavern.

The central points of London were at that time the newly erected Exchange and St. Paul's Church, which was regarded not only as the Cathedral of the city, but as a meeting place and promenade for idlers, a sort of club where

the news of the day was to be heard, a hiring-fair for servants, and a sanctuary for debtors who were there secure from arrest.

How picturesquely all this is set forth by Brandes: "The streets, still full of the many-colored life of the Renaissance, rang with the cries of 'prentices inviting customs and hawkers proclaiming their wares; while through them passed many a procession, civil, ecclesiastical, or military, bridal companies, pageants, and troops of crossbow-men and men-at-arms. Elizabeth herself might be met in the streets, driving her huge State carriage, when she did not prefer to sail on the Thames in her magnificent gondola, followed by a crowd of gaily decorated boats. . . .

"The handsome, parti-colored, extravagant costumes of the period are well known. The puffed sleeves of the men, the women's stiff ruffs, and the fantastic shapes of their hooped skirts, are still to be seen in the stage presentations of plays of the time. The Queen and her Court set the example of great and unreasonable luxury with respect to the number and material of costumes. The ladies rouged their faces, and often dyed their hair. Auburn, as the Queen's color, was the most fashionable. The conveniences of daily life were very meagre. Only of late had fireplaces begun to be substituted for the open hearths. Only of late had proper bedsteads come into general use. When Shakespeare's well-to-do grandfather, Richard Arden, made his will, in the year 1556, there was only one bedstead in the house where he lived with his seven daugh-

ters. People slept on straw mattresses, with a billet of wood under their heads and a fur rug over them. The only decoration of the rooms of the wealthier classes was the tapestry on the walls, behind which people so often conceal themselves in Shakespeare's plays."

There is a further description of the manner of living at the time which aids materially in giving reality to Shakespeare's plays, although not always revealed on the stage: "The dinner hour was at that time eleven in the morning, and it was reckoned fashionable to dine early. Those who could afford it ate rich and heavy dishes; the repasts would often last an inordinate time, and no regard whatever was paid to the minor decencies of life. Domestic utensils were very mean. So late as 1592, wooden trenchers, wooden platters and wooden spoons were in common use. It was just about this time that tin and silver began to supplant wood. Table knives had been in general use since about 1563, but forks were still unknown in Shakespeare's time—fingers supplied their place."

Georg Brandes, realizing the love element in almost all that Shakespeare produced early in his book discusses the poet's conception as to the relations of the sexes. It is one of the most interesting parts of the entire work. He speaks here of *Venus and Adonis*, published in the spring of 1593, when Shakespeare was twenty-nine years old. He took two lines from Ovid's *Amores* as the motto of the poem. Among the poets of antiquity Ovid is naturally his model.

Brandes is of the opinion that after coming to London, Shakespeare took his marriage to a woman eight years his senior as a piece of youthful folly. A close study of his works confirms this conjecture. There are in *Twelfth Night* certain passages that show this personal regret at the memory of his early marriage and the circumstances under which it came about. *The Tempest* is another instance where, as in Prospero's warning to Ferdinand, Shakespeare shows a growing tendency to have the love element predominate on equal terms and without compulsion.

IV.

Shakespeare early realized that in spite of the fame and popularity that such a poem as *Venus and Adonis* brought him it was not narrative but dramatic poetry which offered the fullest scope for his powers.

"And now it is that we find him for the first time rising to the full height of his genius," declares Brandes. "This he does in a work of dramatic form; but significantly enough, it is not as yet in its dramatic elements that we recognize the master-hand, but rather in the rich and incomparable lyric poetry with which he embroiders a thin dramatic canvas.

"His first is a masterpiece of grace, both lyrical and comic. A *Midsummer Night's Dream* was no doubt written as a festival-play or masque, before the masque became an established art-form, to celebrate the marriage of a noble patron. . . . We have here no

pathos. The hurricane of passion does not as yet sweep through Shakespeare's work. No; it is only the romantic and imaginative side of love that is here displayed, the magic whereby longing transmutes and idealizes its object, the element of folly, infatuation and illusion in desire, with its consequent variability and transitoriness."

Very interesting is the way that Brandes characterizes *Romeo and Juliet* as the drama of youthful and impulsive love-at-first-sight, "so passionate that it bursts every barrier in its path; so determined that it knows no middle way between happiness and death, so strong that it throws the lovers into each other's arms with scarcely a moment's pause, and, lastly, so ill-fated that death follows straightway upon the ecstasy of the union."

How succinctly the Danish critic here tells with a few well directed strokes the life-story of youthful love self-consumed through the very fervor of the principals. *Romeo and Juliet* retains its hold on the imagination because of its fidelity to truth. His material enables Shakespeare to place his love-story in the setting best fitted to throw into relief the beauty of the emotion, using as his background a vendetta between two noble families, which has grown from generation to generation through one sanguinary reprisal after another, until it has actually infected the whole town around them. According to the traditions of the race the lovers ought to hate each other. The fact that, on the contrary, they are so passionately drawn together in mutual ecstasy bears witness from

the outset to the strength of an emotion which not only neutralizes prejudice in their own minds, but continues to assert itself in opposition to the prejudices of their surroundings.

There are several good reasons why *Love's Labor Lost* no doubt is Shakespeare's earliest comedy. As a counterpart to this he soon after wrote *Love's Labours Won*. As we know, no play of that name is now included in Shakespeare's works. But Brandes is of the opinion that it is scarcely conceivable that one of his plays, once acted, should have been entirely lost, and he believes that *Love's Labor's Won* is *All's Well that Ends Well*, but with many revisions.

Let us now with Brandes take a look into the theaters of Shakespeare's time. "On swampy ground beside the Thames lay the theaters," we read, "of which the largest were wooden sheds, only half thatched with rushes, with a trench around them and a flagstaff on the roof. After the middle of the fifteen-seventies, when the first was built, they shot up rapidly, and in the early years of the new century theater-building took such a start that, as we learn from Prynne's '*Histriomastix*,' there were in 1633 no fewer than nineteen permanent theaters in London, a number which no modern town of 300,000 inhabitants can equal. These figures show how keen and how widespread was the interest in the drama. . . . The days of performance at these theaters were announced by the hoisting of a flag on the roof. The time of beginning was three o'clock punctually and the performance went straight on, uninterrupted by entr'actes. It lasted as a rule

for only two hours, or two hours and a half. Close to the Globe Theater lay the Bear Garden, the rank smell from which greeted the nostrils, even before it came in sight. The famous bear, Sackerson, who is mentioned in *The Merry Wives of Windsor*, now and then broke his chain and put female theater-goers shriekingly to flight.

"Tickets there were none. A penny was the price of admission to standing room in the yard; and those who wanted better places put their money in a box held out to them for that purpose, the amount varying from a penny to a half-crown, in accordance with the places required."

That much was left to the imagination of the audience and that the audience was fully prepared to utilize this imagination to the full is asserted by Brandes as he shows with what crude accessories the plays were staged. The walls were either hung with loose tapestries or quite uncovered, so that the wooden doors which led to the players' rooms at the back were clearly visible. In battle scenes, whole armies entered triumphant, or were driven off in confusion and defeat, though a single door. When a tragedy was acted the stage was usually hung in black; for a comedy the hangings were blue. As in the theater of antiquity, rude machines were employed to raise or lower actors through the stage; trap-doors were certainly in use, and probably "bridges" or small platforms, which could be elevated into the upper regions. It was Inigo Jones who first introduced movable scenery and decorations

at the court entertainments. They were certainly not in use at the popular playhouses at any time during Shakespeare's connection with the stage, avers Brandes.

Here is an interesting picture of one of the Shakespeare audiences as visualized by Georg Brandes: "In the boxes sat the better sort of spectators, officers, city merchants, sometimes with their wives; but ladies always wore a mask of silk or velvet, partly for protection against sun and air, partly in order to blush (or not to blush) unseen, at the frivolous and often licentious things that were said upon the stage. The mask was then as common an article of female attire as is the veil in our days. But the front rows of what we should now call the first tiers were occupied by beauties who had no desire whatever to conceal their countenances, though they might use the mask (as in later times the fan) for purposes of coquetry. These were the kept mistresses of men of quality, and other gorgeously decked ladies, who resorted to the playhouse in order to make acquaintances. Behind them sat the respectable citizens. But in the gallery above a rougher element assembled—sailors, artisans, soldiers and loose women of the lowest class.

"No woman ever appeared on the stage. The frequenters of the pit, with their coarse bolsterousness, were the terror of the actors. They all had to stand—coalheavers and bricklayers, dock laborers, serving-men and idlers. Refreshment-sellers moved about among them, supplying them with sausages and ale, with apples and nuts. They ate and drank, drew

corks, smoked tobacco, fought with each other, and often, when they were out of humor, threw fragments of food, and even stones, at the actors. Now and then they would come to loggerheads with the fine gentlemen on the stage, so that the performance had to be interrupted and the theater closed."

V.

It is not the present purpose to take each of Shakespeare's plays and see what Brandes has to say about it. That would involve a task as unnecessary as it would be difficult within the prescribed limits of a Haldeman-Julius booklet, which first of all means compactness. However, there are certain high lights that shine with a refulgence all their own and with which the general public has acquaintance. Here the Brandes viewpoint should be of particular interest since it affords opportunity of comparison with other leading Shakespearean scholars' opinion.

Romeo and Juliet, because of its popularity, is just such a play as might induce a critic like Georg Brandes to give it his special attention. In its original form, he opines, the play must be assumed to date from 1591, from Shakespeare's twenty-seventh year. The First Quarto of *Romeo and Juliet* was published in 1597. But even if the dramatist began to work upon the theme in 1591, there appears to be little doubt that Shakespeare, according to his frequent practice, went through the play again, revised and remolded it, somewhere between that date and 1599, when it appeared in the

Second Quarto almost in the form in which we now possess it.

"*Romeo and Juliet*," Brandes remarks, "is perhaps not such a flawless work of art as *A Midsummer Night's Dream*. It is not so delicately, so absolutely harmonious. But it is an achievement of much greater significance and moment; it is the great and typical love-tragedy of the world. It soars immeasurably above all later attempts to approach it."

Shakespeare was thirty years old when he turned to the historic drama. He begins to occupy himself in earnest with history, reading the chronicles, to project and work out a whole series of historical plays. Brandes affirms that Shakespeare's plays founded on English history and numbering ten in all, are of a very unequal value, and can by no means be treated as standing on one plane.

Richard III appears to interest Brandes especially. "The text of *Richard III*," he says, "presents no slight difficulties to the editors of Shakespeare. Neither the First Quarto nor the greatly amended Folio is free from gross and baffling errors. The editors of the Cambridge Edition have attempted to show that both texts are taken from bad copies of the original manuscripts. It would not surprise us, indeed, that the poet's own manuscript, being perpetually handled by the prompter and stage-manager, should quickly become so ragged that now one page and now another would have to be replaced by a copy."

Everyone who has been nurtured upon Shakespeare has from his youth dwelt wonderingly

upon the figure of Richard, "that fiend in human shape, striding with savage impetuosity, from murder to murder, wading through falsehood and hypocrisy to ever-new atrocities, becoming in turn regicide, fratricide, tyrant, murderer of his wife and of his comrades, until, besmirched with treachery and slaughter, he faces his foes with invincible greatness." Into this character, Brandes adds, "Shakespeare transforms himself in imagination. It is the mark of the dramatic poet to be always able to get out of his own skin and into another's. But in later times some of the greatest dramatists have shrunk shuddering from the out-and-out criminal, as being too remote for them. For example, Goethe. His wrong-doers are only weaklings, like Weislingen and Clavigo; even his Mephistopheles is not really evil. Shakespeare, on the other hand, made the effort to feel like Richard.

"How did he set about it? Exactly as we do when we strive to understand another personality; for example, Shakespeare himself. He imagines himself into him; that is to say, he projects his mind into the other's body and lives in it for the time being. The question the poet has to answer is always this: How should I feel and act if I were a prince, a woman, a conqueror, an outcast, and so forth? Shakespeare takes, as his point of departure, the ignominy inflicted by Nature; Richard is one of Nature's victims."

How can Shakespeare feel with him here, asks Brandes,—Shakespeare to whom deformity of body was unknown, and who had been

immoderately favored by Nature? But he, too, had long endured humiliation, and had lived under mean conditions which afforded no scope either to his will or to his talents. Poverty is itself a deformity; and the condition of an actor was a blemish like a hump on his back. Thus he is in a position to enter with ease into the feelings of one of Nature's victims. He has simply to give free course to all the moods in his own mind which have been evoked by personal humiliation, and to let them ferment and run riot.

Who that has seen or read *Richard III*, (and who has not?) will at once perceive why Shakespeare managed to infuse such realism into that tragedy built on historic facts. So also, the Brandes interpretation reveals a psychological intent on the part of the Bard of Avon. Here, as perhaps nowhere else in Shakespeare, excepting *King Lear*, fear and trembling, coupled with almost unbelievable cruelty, underlie the actions of those characters through whom the dramatist sought to make them stand forth as object lessons.

It is true that Shakespeare was no miniature-painter. Minutely detailed psychological painting, such as in the case of Dostoevski, was not his affair. And yet he showed in *Hamlet* what he could do with complex characters. Richard he builds up from a few simple characteristics: deformity, the potent consciousness of intellectual superiority, and the lust for power. His whole personality can be traced back to these simple elements. He is courageous out of self-esteem; he plays the lover out of

ambition; he is cunning and false, a comedian and a blood-hound, as cruel as he is hypocritical—and all in order to attain to that despotism on which he had set his heart.

"In no other play of Shakespeare's, we may surely say," writes Brandes, "is the leading character so absolutely predominant as here. He absorbs almost the whole of the interest, and it is a triumph of Shakespeare's art that he makes us, in spite of everything, follow him with sympathy. This is partly because several of his victims are so worthless that their fate seems well deserved. Anne's weakness deprives us of our sympathy, and Richard's crime loses something of its horror when we see how lightly it is forgiven by the one who ought to take it most to heart. In spite of all his iniquities, he has wit and courage on his side—a wit which sometimes rises to Mephistophelian humor, a courage which does not fail him even in the moment of disaster, but sheds a glory over his fall which is lacking to the triumph of his coldly correct opponent. However false and hypocritical he may be towards others, he is no hypocrite to himself."

VI.

Brandes calls *King Lear* the tragedy of a world-catastrophe. "I imagine," he says, "that Shakespeare must, as a rule, have worked early in the morning. The division of the day at that time would necessitate this. But it can scarcely have been in bright morning hours, scarcely in the daytime, that he conceived *King*

Lear. No; it must have been on a night of storm and terror, one of those nights when a man, sitting at his desk at home, thinks of the wretches who are wandering in houseless poverty through the darkness—the blustering wind, and the soaking rain—when the rushing of the storm over the house-tops and its howling in the chimneys sound in his ears like shrieks of agony, the wail of all the misery of earth.”

It is nothing less than the social question, as we understand it to-day, that Shakespeare presents in *King Lear*; the extreme wretchedness and want that underlie so many problems of the present as they must have been in evidence also in his day. *Lear* says in the play: “You see how this world goes.” Nowhere else is evil and good shown in such immediate opposition. Everything centers in the protagonist, poor, stupid, great *Lear*, every inch a king, and every inch human.

“At heart he is so lovable,” affirms Brandes, “that he arouses the unalterable devotion of the best among those who surround him; and he is so framed to command and accustomed to rule, that he misses every moment that power which, in an access of caprice, he has renounced. For a brief space at the beginning of the play the old man stands erect; then he begins to bend. And the weaker he grows the heavier the load heaped upon him, till at last, overburdened, he sinks. He wanders off, groping his way, with his crushing fate upon his back. Then the light of his mind is extinguished; madness seizes him. . . .

“The end of all things seems to have come

when we see the ruin of the moral world—when he who is noble and trustful like Lear is rewarded with ingratitude and hate; when he who is honest and brave like Kent is punished with dishonor; when he who is merciful like Gloucester, taking the suffering and injured under his roof, has the loss of his eyes for his reward; when he who is noble and faithful like Edgar must wander about in the semblance of a maniac with a rag round his loins, when, finally she who is the living emblem of womanly dignity and of filial tenderness towards an old father who has become as it were a child—when she meets her death before his eyes at the hands of assassins! What avails it that the guilty slaughter and poison each other afterwards? None the less is this the titanic tragedy of human life; there rings forth from it a chorus of passionate, jeering, wildly yearning and desperately wailing voices.

“Sitting by his fire at night, Shakespeare heard them in the roar of the storm against the window-pane, in the howling of the wind in the chimneys—heard all these terrible voices contrapuntally interwoven one with another as in a fugue, and heard in them the torture-shriek of suffering humanity.”

It goes without saying that Cordelia appeals vastly to Brandes as a character whose sacrifices deserved better than was her lot. While the elder daughters have inherited and overdeveloped Lear's bad qualities, Cordelia has fallen heir to his goodness of heart; but he has also transmitted to her a certain obstinacy and pride, but for which the conflict would not have

arisen. How touching is the passage where Cordelia finds her brain-sick sire, and tends him until, by aid of the healing art, and sleep, and music, he slowly regains his health. That this old man should lose his youngest daughter—this is the catastrophe which Shakespeare has made so great that it is with reason Kent asks: "Is this the promised end? Is this the end of the world?"

"The loss of Cordelia," concludes Brandes's comment on this great tragedy, "that is the great catastrophe. We all lose, or live under the dread of losing, our Cordelia. The loss of the dearest and the best, of that which alone makes life worth living—that is the tragedy of life. Hence the question: Is this the end of the world? Yes, it is. Each of us has only his world, and lives with the threat of its destruction hanging over him. And in the year 1606 Shakespeare was in no mood to write other than dramas on the doom of worlds."

VII.

Passing from the sombre to the gay, from Shakespeare's *King Lear* to his immortal Falstaff, what a picture is Brandes's characterization as he turns his searchlight on a personality that stands for all time as the embodiment of mirth and the grotesque. But the Danish critic would not be what he is did he not furnish us with much more than a mere study of Falstaff as Falstaff. No, Brandes takes us into the Shakespearean inner circle, into the tavern life of the day, makes us acquainted with the

young aristocrats who, in Shakespeare, appear under the names of Mercutio and Benedick, Gratiano and Lorenzo, these gay fellows of the upper world who made pleasure their whole pursuit.

"Dressed in silk or ash-colored velvet," Brandes writes, "and with gold lace on his cloak, the young man of fashion began by riding to St. Paul's and promenading half-a-dozen times up and down its middle aisle. He then 'repaired to the Exchange, and talked pretty euphuisms to the citizens' daughters,' or looked in at the bookseller's to inspect the latest play-book or pamphlet against tobacco. Next he rode to the ordinary where he had appointed to meet his friends and dine. At dinner he discussed Drake's expedition to Portugal, or Essex's exploits at Cadiz, or told how he had broken a lance with Raleigh himself at the Tilt-yard. He would mingle snatches of Italian and Spanish with his talk, and let himself be persuaded, after dinner, to recite a sonnet of his own composition. At three he betook himself to the theater, saw Burbage as Richard III, and applauded Kemp in his new jig; after which he would spend an hour at the bear-garden. Then to the barber's, to have his hair and beard trimmed, in preparation for the carouse of the evening at whichever tavern he and his friends had selected—the 'Mitre,' the 'Falcon,' the 'Apollo,' the 'Boar's Head,' the 'Devil,' or—most famous of all—the 'Mermaid,' where the literary club, the 'Syren,' founded by none other than Sir Walter Raleigh himself, held its meetings."

This, then, was the environment of Shakespeare's Falstaff. Here also, the young aristocrat rubs shoulders with the leading players, such as Burbage and Kemp, and with the best known men of letters, such as John Lyly, George Chapman, John Florio, Michael Drayton, Samuel Daniel, John Marston, Thomas Nash, Ben Jonson, William Shakespeare.

"To Shakespeare's circle Chettle must doubtless have belonged," Brandes comments, "that Chettle who in bygone days had published Greene's *Groatsworth of Wit*, and afterwards made amends to Shakespeare for Greene's coarse attack upon him. In Dekker's tract, *A Knight's Conjuring*, dating from 1607, he figures among the poets in Elysium, where he is introduced in the following terms: 'In comes Chettle sweating and blowing, by reason of his fatness; to welcome whom, because hee was of olde acquaintance, all rose up, and fell presentlie on their knees, to drinck a health to all the louers of Hellicon.'

"Elze has conjectured, possibly with justice, that in this puffing and sweating old ton of flesh, who is so whimsically greeted with mock reverence by the whole gay company, we have the very model from whom Shakespeare drew his demigod, the immortal Sir John Falstaff, beyond comparison the gayest, the most concrete, and most entertaining figure in European comedy. In his close-woven and unflagging mirthfulness, in the inexhaustible wealth of drollery concentrated in his person, Falstaff surpasses all that antiquity and the Middle Ages have produced in the way of comic char-

acter, and all that the stage of later times can show."

Brandes takes occasion to bring Rabelais upon the scene for the purpose of comparing Shakespeare's Falstaff with the other's Panurge. Rabelais, of course, was the master spirit of the early Renaissance in France. Brandes says that when we compare Falstaff with Panurge we see that Rabelais stands to Shakespeare in the relation of a Titan to an Olympian god. Rabelais is gigantic, disproportioned, potent, but formless. Shakespeare is smaller and less excessive, poorer in ideas, though richer in fancies, and moulded with the utmost firmness of outline.

In 1598 appeared a Quarto with the following title: "The History of Henrie the Fourth; With the battell of Shrewsburie, betweene the King and Lord Henry Percy, surnamed Henrie Hotspur of the North. With the humorous conceits of Sir John Falstaffe. At London. Printed by P. S. for Andrew Wise, dwelling in Paules Churchyard, at the signe of the Angell. 1598." This was the first part of Shakespeare's *Henry IV*, which must have been written in 1597—the play in which Shakespeare first attains his great and overwhelming individuality. At the age of thirty-three, he stands for the first time at the summit of his artistic greatness.

In the original form of *Henry IV*, we learn, Falstaff's name was Sir John Oldcastle. Under the name of Falstaff he became, after the lapse of half a century, the most popular of Shakespeare's creations. Between 1642 and 1694, he is more frequently mentioned than any other of

Shakespeare's characters. He was, according to Brandes, "the wine-god of merry England at the meeting of the centuries." Never before or since has England enjoyed so many sorts of beverages. There was ale, and all other kinds of strong and small beer, and apple-drink, and honey-drink, and strawberry-drink, and three sorts of mead—meath, metheglin, hydromel—and every drink was fragrant of flowers and spiced with herbs. In white meath alone there was infused rosemary and thyme, sweet-briar, pennyroyal, bays, water-cresses, agrimony, marsh-mallow, liverwort, maiden-hair, betony, eye-bright, scabious, ash-leaves, ringo root, wild angelica, rib-wort, sennicle, Roman wormwood, tamarisk, mother thyme, saxifrage, philipendula; and strawberries and violet leaves were often added. Cherry wine and sack were mixed with gillyflower syrup.

Is it to be wondered that an age that produced such a profusion of beverages could bring forth a character like Falstaff? There were fifty-six varieties of French wine in use, and thirty-six of Spanish and Italian, to say nothing of the many home-made kinds. But among the foreign wines none was so famous as Falstaff's favorite sherrisack. It took its name from Xeres in Spain, but differed from the modern sherry in being a sweet wine.

"Falstaff is a great wine-knower," Brandes declares, "but he is infinitely more than that. He is one of the brightest and wittiest spirits England has ever produced. He is one of the most glorious creations that ever sprang from a poet's brain. There is much rascality and

much genius in him, but there is no trace of mediocrity. He is always superior to his surroundings, always resourceful, always witty, always at his ease, often put to shame, but thanks to his inventive effrontery, never put out of countenance. He has fallen below his social position; he lives in the worst—though also in the best—society; he has neither soul, nor honor, nor moral sense; but he sins, robs, lies, and boasts, with such splendid exuberance, and is so far above any serious attempt at hypocrisy, that he seems unfailingly amiable whatever he may choose to do. Therefore he charms every one, although he is a butt for the wit of all. He perpetually surprises us by the wealth of his nature. He is old and youthful, corrupt and harmless, cowardly and daring, 'a knave without malice, a liar without deceit; and a knight, a gentleman and a soldier, without either dignity, decency or honor.' The young Prince shows good taste in always and in spite of everything seeking out his company."

VIII.

The same creative spirit that produced such a rollicking character as Falstaff gave Shylock to the world. And what a contrast is here presented. *The Merchant of Venice* is perhaps that of Shakespeare's plays which gives earliest intimation of the author as a man of business. The date of its composition is no doubt around 1597. *The Taming of the Shrew* preceded it about a year. It is beyond question that Marlowe's *Jew of Malta* gave Shakespeare his first literary impulse towards *The Merchant of*

Venice. Barabas is a Jew and usurer, like Shylock. Like Shylock he has a daughter who is in love with a poor Christian; and like him, he thirsts for revenge. But he is a monster, not a man.

Brandes presents Shylock as a character as much to be pitied almost as shunned. "While Marlowe," he says, "according to his custom, made his Barabas revel in mythological similes, Shakespeare indicates that Shylock's culture is founded entirely upon the Old Testament and makes commerce his only point of contact with the civilization of later times. All his parallels are drawn from the Patriarchs and the Prophets. . . . He is no wild animal; he is no heathen who simply gives the rein to his natural instincts; his hatred is not ungoverned; he restrains it within its legal rights, like a tiger in its cage. He is entirely lacking, indeed, in the freedom and serenity, the easy-going, light-hearted carelessness which characterizes a ruling caste in its virtues and its vices, in its charities and in its prodigalities; but he has not a single twinge of conscience about anything that he does; his actions are in perfect harmony with his ideals.

"Sundered from the regions, the social forms, the language, in which his spirit is at home, he has yet retained his Oriental character. Passion is the kernel of his nature. It is his passion that has enriched him; he is passionate in action, in calculation, in sensation, in hatred, in revenge, in everything. His vengefulness is many times greater than his rapacity. Avari-

cious though he be, money is nothing to him in comparison with revenge.

“It is not until he is exasperated by his daughter’s robbery and flight that he takes such hard measures against Antonio, and refuses to accept three times the amount of the loan. His conception of honor may be unchivalrous enough, but, such as it is, his honor is not to be bought for money. His hatred of Antonio is far more intense than his love for his jewels; and it is this passionate hatred, not avarice, that makes him the monster he becomes.”

The question naturally arises whether Georg Brandes’s Jewish antecedents have in any way influenced him in his depiction of Shakespeare’s vengeful Jew. We know, of course, that religion plays no part in Brandes’s spiritual makeup. He avows adherence to no creed or dogma. Again and again he has proclaimed the fact that mankind has a right to believe as it prefers. For himself, the mentality of the old Greeks appears to have been transplanted in the mind of this Danish critic who is perhaps considerably of a stoic.

It is no secret that when Brandes began to attract attention as a writer of unusual talent he met with an opposition in his home country that could hardly fail to cause embitterment. His lectures at the University of Copenhagen had aroused the orthodox element of Denmark and his liberal viewpoints were termed nothing less than an absolute departure from what was in that day thought right and proper. We may be sure that Shakespeare’s *Merchant of*

Venice came before his mental vision many times as an example of what religious bigotry may accomplish in the case of one who has been declared as standing apart from his fellow men. Shylock's vehemence unquestionably seemed justified to a degree in the eyes of the Danish critic who nearly half a century ago was perfecting the material that went to the making of his epochal "Main Currents in Nineteenth Century Literature."

At this juncture it may not be amiss to digress for a moment from a consideration of Brandes's *Shakespeare* and turn to his *Lord Beaconsfield*. This biography of Benjamin Disraeli, Brandes wrote some time before 1880, the American translation appearing in that year. Here there are unmistakable signs of Brandes's bitter arraignment of those who would look down upon others not of the same religious belief as they. Every novel that Brandes here passes in review as explaining the ambitious plans of him who later was to rule the British empire as Prime Minister, bears the indubitable stamp of defense of the religion that Disraeli's forebears disavowed for reasons bordering on expediency. Lord Beaconsfield, however, never seemed to have forgotten that he sprang from the race that gave to the world the Savior of Christianity.

Benjamin Disraeli, writes Brandes, was a descendant of one of the Jewish families compelled by the Spanish Inquisition to leave the Peninsula towards the end of the fifteenth century. These families, who, although expelled from Palestine, had never wandered from the

originally civilized countries of ancient times—those in the Mediterranean basin, and who had never been exposed to a rigid climate—formed for a long time the natural aristocracy of the Jewish people. They had resided, happy and respected, partly in the large cities, partly on their estates in Aragon, Andalusia, and Portugal, for the acquisition of landed property was not then denied them.

“Fanaticism afterwards deprived them, by one blow, of all their rights and hopes,” Brandes declares. “Lord Beaconsfield’s ancestors, therefore, took refuge in the Venetian Republic, and, according to a family tradition, as soon as they trod the soil of Venice, renounced their Spanish name, and, “from gratitude to the God of Jacob, who had led them through unexampled trials and unheard-of dangers,” took the name of d’Israeli, by which the family was henceforth to be known. It grew and flourished without let or hindrance for more than two hundred years.

We next read how toward the end of the eighteenth century, a member of the family resolved to send his youngest son, Benjamin, to England, which seemed then to secure religious liberty to the Jews, and offered a favorable opening for commercial undertakings on a large scale. Religious liberty, however, was neither of long standing nor complete in England. The Jews had been expelled from the country long before they had been driven from Spain or Portugal.

“It was not until the time of the Commonwealth that protected by Cromwell himself,

though not by any law, the Jews began to return to England," says Brandes. "Under George II, the Minister, Lord Pelham, was favorable to them, and during his ministry, Benjamin d'Israeli, the grandfather and namesake of Lord Beaconsfield, became, in the year 1748, an English citizen, without civil rights."

Benjamin Disraeli was the son of Isaac d'Israeli. His mother was Maria Basevi. The boy was received into the Jewish community; but when his father afterwards separated himself from it, if reports speak truly, avers Brandes, he gave his friend Samuel Rogers leave to take him to church and have him baptized. Rogers was totally indifferent to religion, but it seemed to him a pity—so it is said—that this fine, intelligent boy should be excluded by his creed from the most important and highest social advantages. At any rate, the baptism took place in the parish of St. Andrews, on the thirty-first of July, 1817.

What Benjamin Disraeli nevertheless suffered of ignominy because of his Jewish parentage, Brandes emphasizes as he considers *Vivian Grey* and *Contarini Fleming*, both as literary productions and as autobiographical novels in which the future Lord Beaconsfield gets back at those who hurled insult against him in his boyhood days. It is as a champion of religious liberty that Brandes with evident relish enters into a detailed account of Disraeli's heroës. It all has a tendency towards showing how much the Danish critic had stored up of literary equipment when finally the day came for him to treat of Shakespeare on a large scale and

with Shylock, one of the outstanding figures in his gallery of portraits.

IX.

And now as to *Hamlet, Prince of Denmark*. It is not for nothing that Shakespeare's immortal tragedy caused Brandes to devote so much of his book to the Melancholy Dane.

"Many and various emotions crowded upon Shakespeare's mind in the year 1601," we learn. "In its early months Essex and Southampton were condemned. At exactly the same time there occurs the crisis in the relations of Pembroke and Shakespeare with the Dark Lady. Finally, in the early autumn, Shakespeare suffered a loss which he must have felt deeply. The Stratford register of burials for 1601 contains this line:

"September 8, Mr. Johannes Shakespeare.

"He lost his father, his earliest friend and guardian, whose honor and reputation lay so near to his heart. The father probably lived with his son's family in the handsome New Place, which Shakespeare had bought four years before. He had doubtless brought up the two girls Susanna and Judith; he had doubtless sat by the death-bed of the little Hamnet. Now he was no more. All the years of his youth, spent at his father's side, revived in Shakespeare's mind, memories flocked in upon him, the fundamental relations between son and father preoccupied his thought, and he fell to brooding over filial love and filial reverence. In the same year *Hamlet* began to take shape in Shakespeare's imagination."

It is with particular interest that we approach Brandes's interpretation of the Hamlet character. Not only because the critic, himself a Dane, may be expected to have analyzed most thoroughly the fundamental reasons why Shakespeare chose Denmark for the tragedy's environment, but also because, in following Brandes here, we are able to gain a clearer insight into his own character.

The chapters devoted to Hamlet occur in almost the middle of the book and occupy a large space. First we have Hamlet: Its Antecedents in Fiction, History and the Drama; next Hamlet—Montaigne and Giordano Bruno—Traits of Danish Manners; again, The Personal Element in Hamlet; then, in succession, The Psychology of Hamlet, Hamlet as a Drama, Hamlet and Ophelia, Hamlet's Influence on Later Times, finally, Hamlet as a Critic.

Hamlet as a critic! Brandes, as a critic of Hamlet. What then do we find? We read: "Along with motives from novel, drama and history, impressions of a philosophical and quasi-scientific order went to the making of *Hamlet*. Of all Shakespeare's plays, this is the profoundest and most contemplative; a philosophical atmosphere breathes around it. . . In approaching the theme Shakespeare obeyed a fundamental instinct in his nature; and as he worked it out, everything that stood in relation to it rushed together in his mind. He might have said with Goethe: 'After long labor in piling up fuel and straw, I have often tried in vain to warm myself . . . until at last the spark catches all of a sudden, and the whole

is wrapped in flame.' It is this flame which shines forth from 'Hamlet,' shooting up so high and glowing so red that to this day it fascinates all eyes.

"Hamlet" assumes madness in order to lull the suspicions of the man who has murdered his father and wrongfully usurped his throne; but under this mask of madness he gives evidence of rare intelligence, deep feeling, peculiar subtlety, mordant satire, exalted irony, and penetrating knowledge of human nature."

Brandes asserts that it cost Shakespeare no effort to transform himself into Hamlet. On the contrary, in giving expression to Hamlet's spiritual life he was enabled to quite naturally pour forth all that during recent years had filled his heart and seethed in his brain. He could let this creation drink in his inmost heart's blood; he could transfer to it the throbbing of his own pulses. Behind its forehead he could hide his melancholy; on its tongue he could lay his wit; its eyes he could cause to glow and lighten with flashes of his own spirit.

It came almost as a matter of course, that when the tercentenary of the death of Shakespeare was solemnized throughout the civilized world on April 23, 1916, and a performance of *Hamlet* was given at the very Castle of Elsinore in the presence of the Royal Danish family and the entire literary and artistic community of Copenhagen, the task of delivering the introductory address on that important day fell to Georg Brandes. His *William Shakespeare* had long before become a stand-

ard work to which Shakespearean students looked for that intimate information which Brandes supplies so plenteously. It need hardly be said that what he then had to tell about the Hamlet character and its creator was in entire accord with his reputation as orator.

As we proceed with this critic to a further examination of Hamlet's character the psychological aspect comes strongly into view. "Though there are in *Hamlet* more direct utterances of the poet's inmost spiritual life than in any of his earlier works," we read, "he has none the less succeeded in thoroughly disengaging his hero's figure, and making it an independent entity. What he gave him of his own nature was its unfathomable depth; for the rest, he retained the situation and the circumstances much as he found them in his authorities. . . . The figure of *Hamlet*, as it at last shaped itself in Shakespeare's imagination, and came to life in his drama, is one of the few immortal figures of art and poetry, which, like Cervantes's *Don Quixote*, exactly its contemporary, and Goethe's *Faust* of two centuries later, present to generation after generation problems to brood over and enigmas to solve."

What about Hamlet in his relation to Ophelia? Here Brandes is quite definite. "There is nothing more profoundly conceived in this play," he declares, "than the Prince's relation to Ophelia. Hamlet is genius in love—genius with its great demands and its highly unconventional conduct. He does not love like Romeo, with a love that takes entire pos-

session of his mind. He has felt himself drawn to Ophelia while his father was still in life, has sent her letters and gifts, and thinks of her with infinite tenderness; but she has it not in her to be his friend and confidante.

... Hamlet draws away from Ophelia from the moment when he feels himself the appointed minister of a sacred revenge. In deep grief he bids her farewell without a word, grasps her wrist, holds it at arm's length from him, 'peruses' her face as if he would draw it—then shakes her arm gently, nods his head thrice, and departs with a 'piteous' sigh.

"If after this he shows himself hard, almost cruel, to her, it is because she was weak and tried to deceive him. She is a soft, yielding creature, with no power of resistance; a loving soul, but without the passion which gives strength. She resembles Desdemona in the unwisdom with which she acts towards her lover, but falls far short of her in warmth and resoluteness of affection. She does not in the least understand Hamlet's grief over his mother's conduct. She observes his depression without divining its cause."

It is the opinion of Brandes that in depicting the relation between Faust and Gretchen, Goethe appropriated and reproduced many features of the relation between Hamlet and Ophelia. In both cases we have the tragic love-tie between genius and tender girlhood.

X.

How different the characterization in the case of Cleopatra. Coming fresh from his treat-

ment of Cordelia in *King Lear*, Shakespeare had seen in her the ideal which one's imagination reads on a young girl's white brow, and which the young girl herself hardly understands, much less realizes. She was the ray of white light—the great, clear, symbol of the purity and nobility of heart which were expressed in her very name. He believed in her; he had looked into her innocent eyes, whose expression inspired him with the idea of her character.

"Cleopatra, on the contrary, O Cleopatra!" Brandes exclaims. Shakespeare, he says, "passed before his eyes the most feminine, and therefore the most dangerous, woman he had known since he gained a footing in London, and he gave her the grace of the one, the caprices of another, the teasing humor of a third, a fourth's instability; but deep in his heart he was thinking of one only, who had been to him all women in one, a mistress in the art of love and of awakening love, inciting to it as no other incited, and faithlessly betraying as no other betrayed—true and false, daring and frail, actress and lover without peer. . . .

"Assuming that it was Shakespeare's design in *Antony and Cleopatra*, as in *King Lear*, to evoke the conception of a world-catastrophe, we see that he could not in this play, as in *Macbeth* or *Othello*, focus the entire action around the leading characters alone. He could not even make the other characters completely subordinate to them; that would have rendered it impossible for him to give the im-

pression of majestic breadth, of an action embracing half of the then known world, which he wanted for the sake of the concluding effect. He required in the group of figures surrounding Octavius Caesar, and in the groups round Lepidus, Ventidius, and Sextus Pompeius, a counterpoise to Antony's group. He required the placid beauty and Roman rectitude of Octavia as a contrast to the volatile, intoxicating Egyptian. He required Enobarbus to serve as a sort of chorus and introduce an occasional touch of irony amid the highflown passion of the play."

Shakespeare had found in his Plutarch the life of Marcus Antonius which at first he read out of curiosity, then with attention and later with emotion. Here was the real downfall of the Roman world. As Brandes tells it: "Not till now did he hear the final, fatal crash of the old world-republic. The might of Rome, stern, austere, shivered at the touch of Eastern voluptuousness. Everything sank, everything fell—character and will, dominions and principalities, men and woman. Everything was worm-eaten, serpent-bitten, poisoned by sensuality—everything tottered and collapsed. Defeat in Asia, defeat in Europe, defeat in Africa, on the Egyptian coast; then self-abandonment and suicide.

"Again a poison story like *Macbeth*. In *Macbeth*'s case the virus was ambition, in Antony's it was sensuality. But the story of Antony, with its far-reaching effects, was a very much weightier and more interesting subject than the story of the little barbarian Scottish king.

Macbeth was spiritually poisoned by his wife, a woman ambitious to bloodthirstiness, an abnormal woman, more masculine than her husband, almost a virago. She speaks of dashing out the brains of babes as of one of those venial offenses which one may commit on an emergency rather than break one's word, and she undertakes without a tremor to smear the faces of the murdered King's servants with his blood. What is Lady Macbeth to us? What's Hecuba to us? And what was this Hecuba now to Shakespeare?

"In a very different and more personal way did he feel himself attracted by Cleopatra. She poisons slowly, half-involuntarily, and in wholly feminine fashion, the faculty of rule, the generalship, the courage, the greatness of Antony, ruler of half the world—and her (Cleopatra) he (Shakespeare) knew. He knew her as we all know her, the woman of women, quintessentiated Eve, or rather Eve and the serpent in one—'My serpent of old Nile,' as Antony calls her. Cleopatra—the name meant beauty and fascination—it meant alluring sensuality combined with finished culture—it meant ruthless squandering of human life and happiness and the noblest powers. Here, indeed, was the woman who could intoxicate and undo a man, even the greatest; uplift him to such happiness as he had never known before, and then plunge him into perdition, and along with him that half of the world which it was his to rule."

Women, according to Plutarch, were Antony's bane. After a youth in which many women

had had a share, he married Fulvia, the widow of the notorious tribune, Clodius. She acquired the mastery over him, and bent him to all her wishes, so that from her hand he passed into Cleopatra's, ready broken-in to feminine dominion.

Brandes feels that Arthur Symons carries his enthusiasm too far when he writes that "*Antony and Cleopatra* is the most wonderful, I think, of all Shakespeare's plays, and it is so mainly because the figure of Cleopatra is the most wonderful of Shakespeare's women. And not of Shakespeare's women only, but perhaps the most wonderful of women." And yet, Brandes himself declares that "the great attraction of this masterpiece lies in the unique figure of Cleopatra, elaborated as it is with all Shakespeare's human experience and artistic enthusiasm. But the greatness of the world-historic drama proceeds from the genius with which he has entwined the private relations of the two lovers with the course of history and the fate of the empires. Just as Antony's ruin results from his connection with Cleopatra, so does the fall of the Roman Republic result from the contact of the simple hardihood of the West with the luxury of the East. Antony is Rome, Cleopatra is the Orient. When he perishes, a prey to the voluptuousness of the East it seems as though Roman greatness and the Roman Republic expired with him. Not Caesar's ambition, not Caesar's assassination, but this crumbling to pieces of Roman greatness fourteen years later brings home to us the ultimate fall of the old world-republic, and

impresses us with that sense of 'universal annihilation' which in this play, as in *King Lear*, Shakespeare aims at begetting.

"This is no tragedy of a domestic, limited nature like the conclusion of *Othello*; there is no Fortinbras here, as in *Hamlet*, giving the promise of brighter and better times to come; the victory of Octavius brings glory to no one and promises nothing. No; the final picture is that which Shakespeare was bent on painting the moment he felt himself attracted by this great theme—the picture of a world-catastrophe."

XI.

Of feminine types in Shakespeare of a far different order than the one to which Cleopatra belonged, most are of the period when *The Merry Wives of Windsor*, *Much Ado About Nothing*, *As You Like It*, and *Twelfth Night* sprang from this most fertile brain. All of these plays were written between 1599 and 1608. Brandes believes that Shakespeare had entered the stage in his career when all seemed sunshine and that he had never produced with such rapidity and ease as in this bright and happy interval. In *As You Like it* the roving spirit has awakened in his breast—the spirit which in bygone days sent him wandering with his gun through Charlcoate Park, a life of hunting and song, and simple repasts in the open air, accompanied by witty talk; and at the same time a life full to the brim with the dreamy happiness of love. And with this life, the crea-

tion of his roving spirit, his gaiety and his longing for nature, he animates a fantastic Forest of Arden.

This is how the feminine characters are analyzed by Brandes: "The two cousins, Rosalind and Celia, seem at first glance like variations of the two cousins, Beatrice and Hero, in the play which Shakespeare has just finished. Rosalind and Beatrice in particular are akin in their victorious wit. Yet the difference between them is very great; Shakespeare never repeats himself. The wit of Beatrice is aggressive and challenging; we see, as it were, the gleam of a rapier in it. Rosalind's wit is gaiety without a sting; the gleam in it is of that sweet radiance which Oehlenschlaeger attributed to Freia; her sportive nature masks the depth of her love. Beatrice can be brought to love because she is a woman, and stands in no respect apart from her sex; but she is not of an amatory nature. Rosalind is seized with a passion for Orlando the instant she sets eyes on him. From the moment of Beatrice's first appearance she is defiant and combative, in the highest of spirits. We are introduced to Rosalind as a poor bird with a drooping wing; her father is banished, she is bereft of her birthright, and is living on sufferance as companion to a usurper's daughter, being, indeed, half a prisoner in the palace, where till lately she reigned as princess. It is not until she has donned the doublet and hose, appears in the likeness of a page, and wanders of her own sweet will in the open air and the greenwood, that she recovers her radiant humor,

and roguish merriment flows from her lips like the trilling of a bird. . . .

"What Rosalind says of women in general applies to herself in particular: you will never find her without an answer until you find her without a tongue. And there is always a bright and merry fantasy in her answers. She is literally radiant with youth, imagination and the joy of loving so passionately and being so passionately beloved."

In *Twelfth Night*, we read, the notes of seriousness and raillery, of passion, of tenderness and of laughter, blend in the richest and fullest concord. It is like a symphony in which no strain can be dispensed with, or like a picture veiled in a golden haze, into which all the colors resolve themselves.

"This comedy is connected by certain filaments with its predecessor, *As You Like It*, Brandes affirms. "The passion which Viola, in her male attire, awakens in Olivia, reminds us of that with which Rosalind inspires Phebe. But the motive is quite differently handled. While Rosalind gaily and unfeelingly repudiates Phebe's burning love, Viola is full of tender compassion for the lady whom her disguise has led astray. . . . The central character in *Twelfth Night* is Viola, of whom her brother does not say a word too much when, thinking that she has been drowned, he exclaims: 'She bore a mind that envy could not but call fair! . . . But the passion which possesses her makes her a more eloquent messenger of love than she designs to be. To Olivia's question as

to what she would do if she loved her as her master does, she answers:

Make me a willow cabin at your gate,
And call upon my soul within the house;
Write loyal cantons of contemned love,
And sing them loud even in the dead of night;
Holla your name to the reverberate hills,
And make the babbling gossip of the air
Cry out, Olivia! O! you should not rest
Between the elements of air and earth,
But you should pity me.

"In short, if she were a man, she would display all the energy which the Duke lacks. No wonder that, against her own will, she awakens Olivia's love. She herself as a woman, is condemned to passivity; her love is wordless, deep, and patient. In spite of her sound understanding, she is a creature of emotion. It is a very characteristic touch when, in the scene where Antonio, taking her for Sebastian, recalls the services he has rendered, and begs for assistance in his need, she exclaims that there is nothing, not even 'lying vainness, babbling drunkenness, or any taint of vice,' that she hates as much as ingratitude. However bright her intelligence, her soul from first to last outshines it. Her incognito, which does not bring her joy as it does to Rosalind, but only trouble and sorrow, conceals the most delicate womanliness. She never, like Rosalind or Beatrice, utters an audacious or wanton word. Her heart-winning charm more than makes up for the high spirits and sparkling humor of the earlier heroines. She is healthful and beautiful, like these her somewhat elder sisters; and she has also their humorous eloquence, as

she proves in her first scene with Olivia. Yet there rests upon her lovely figure a tinge of melancholy. She is an impersonation of that 'farewell to mirth' which an able English critic discerns in this last comedy of Shakespeare's brightest years.

XII.

A time arrives when Shakespeare no longer writes comedies, but sends a train of gloomy tragedies across the boards which so lately echoed the laughter of Beatrice and Rosalind. It is in the tragedy of *Julius Caesar* that Georg Brandes considers Shakespeare not wholly fair to the great Roman. He declares on this point: "What attracted Shakespeare to this theme? The play is called *Julius Caesar*, but it was obviously not Caesar himself that attracted Shakespeare. The true hero of the piece is Brutus; he it is who has aroused the poet's fullest interest. We must explain to ourselves the why and wherefore.

"The answer is to be found in the point of time at which the play was written. It was that eventful year when Shakespeare's earliest friends among the great, Essex and Southampton, had set on foot their foolish conspiracy against Elizabeth, and when their attempted insurrection had ended in the death of one, the imprisonment of the other. He had seen how proud and nobly-disposed characters might easily be seduced into political error, and tempted to rebellion, on the plea of independence. It is true that there was little enough

resemblance of detail between the mere palace-revolution designed by Essex, which should free him from the Queen's incalculable caprices, and the attempt of the Roman patricians to liberate an aristocratic republic, by assassination, from the yoke of a newly-founded despotism. The point of resemblance lay in the mere fact of the imprudent and ill-starred attempt to effect a subversion of public order."

Shakespeare, according to Brandes, having so arranged his drama that Brutus should be its tragic hero, had to concentrate his art on placing him in the foreground, and making him fill the scene. The difficulty was not to let his lack of political insight—in the cast of Antony—or of practical sense—his quarrel with Cassius,—detract from the impression of his superiority. He had to be the centre and pivot of everything, and therefore Caesar was diminished and belittled to such a degree, unfortunately, that this matchless genius in war and statesmanship has become a miserable caricature, the Danish critic avers.

Brandes has very little good to say of Brutus. But Brutus was already in Plutarch the protagonist of the Caesar tragedy. Shakespeare followed the course of history as presented by Plutarch. As for Antony's oration, here Brandes thinks Shakespeare rose to the highest art as a dramatist. That "Julius Caesar" was received by the London public with acclaim there is indisputable evidence. The learned rejoiced in the breath of air from ancient Rome which met them in these scenes, and the populace was

entertained and fascinated by the striking events and heroic characters of the drama.

As already referred to, the theme of *Julius Caesar* seemed to have attracted Shakespeare on account of the analogy between the conspiracy against Caesar and the conspiracy against Elizabeth. Despite the foolish precipitancy of their action, the leaders of this conspiracy, men like Essex and his comrade Southampton, had Shakespeare's full sympathy; and he transferred some of that sympathy to Brutus and Cassius. He created Brutus under the deeply imprinted conviction that impractical magnanimity, like that of his noble friends, is unfitted to play an effective part in the drama of history and that errors of policy revenge themselves at least as sternly as moral delinquencies.

But let us pass on to another character where Shakespeare displays a mood so much at variance with what elsewhere he had shown when dealing with the opposite sex.

"Shakespeare, who had hitherto worshipped women, has become a misogynist," declares Brandes in speaking of *Troilus and Cressida*. And he continues: "This mood, forgotten since his early youth, rises up again in hundredfold strength, and his very soul overflows in scorn for the sex. What is the cause? Has anything befallen him—anything new? Of what and whom does he think? Does he speak out of new and recent experience, or is it the old sorrow from the time of the Sonnets, of which he made use in the construction of Cleopatra's character, and is this the same grief which has

taken new shape in his mind and is turning sour? Is it this which has grown increasingly bitter until it corrodes? . . .

"We can imagine that Shakespeare began by worshipping his lady-love, complaining of her coldness and hardness, celebrating her fingers in song, cursing her faithlessness, and feeling himself driven nearly wild with grief at the false position in which she had placed him; this is the standpoint of the Sonnets. In the course of years the fever has stormed itself out, but the memory of the enchantment was still visibly fresh, and his mind pictured the loved one as a marvelous phenomenon, half queen, half gipsy, alluring and repellant, true and false, strong and weak, a siren and a mystery; this is the standpoint of *Antony and Cleopatra*. Then, possibly, when life had sobered him down, when he had cooled, as we all do cool in the hardening ice of experience, he suddenly and sharply realized the insanity of an exotic enthusiasm for so worthless an object. He looks upon this condition, which invariably begins with self-deception and must of necessity end in disillusionment, as a disgraceful and tremendous absurdity; and his wrath over wasted feelings and wasted time and suffering, over the degradation and humiliation of its self-deception and ultimately the treason itself, seeks final and supreme relief in the outburst, 'What a farce!' which is in itself the germ of *Troilus and Cressida*.

XIII.

Before discussing the play further, Brandes has a colorful chapter dealing with Shakespeare and Homer, as bearing upon the subject matter of *Troilus and Cressida*. "It is clear," he remarks, "that the Christian conception of faithlessness in love has displaced the old Hellenic innocence and naïveté. How fervant is Achilles's love for Briseis in Homer; how honest, warm and indignant he is when he asks Agamemnon's messengers if among the children of men only the Atrides love their wives, and he himself answers that every man who is brave and of good understanding loves and shelters his wife, as he of his inmost heart loved and would shelter Briseis, prisoner of war through she was. . . Contrast this with the burlesque attempt to provoke that cowardly snob and raw dunce of an Achilles out of his exclusiveness, by passing him by without returning his greeting or seeming conscious of his existence; this same Achilles, who falls upon Hector with his myrmidons and scoundrelly murders him, just as the hero, wearied by battle, has taken off his helmet and laid aside his sword. It reads like the invention of a mediaeval barbarian.

"But Shakespeare is neither mediaeval nor a barbarian. No, he has written it down out of a bitterness so deep that he has felt hero-worship, like love, to be an illusion of the senses. As the phantasy of first love is absurd, and Troilus' loyalty towards its object ridiculous, so is the honor of our forefathers and of war in general a delusion. Shakespeare now

suspects the most assured reputations; he believes that if Achilles really lived at all, he was most probably a stupid and vainglorious boaster, just as Helen must have been a hussy by no means worthy of the turmoil which was made about her. As he distorted Achilles into an absurdity, so he wrenched all other personalities into caricatures."

But what about Cressida? Brandes makes this answer: "Shakespeare deliberately made Cressida sensually attractive, but spiritually repulsive and unclean. She has desire for Troilus, but no love. She is among those who are born experienced; she knows how to inflame, win and keep men enchained, but the honorable love of a man is useless to her. At the same time she is one of those who easily find a master. Any man who is not imposed upon by her airs, who sees through her mock prudish rebuffs, subdues her without difficulty. . . . Cressida is never modest even when she is most prudish; she understands a jest, even bold and libertine ones, and she will bandy them with enjoyment. With all her kittenish charm she is uninteresting, and, in spite of her hot blood, she betrays the coldest selfishness. She is neither ridiculous nor unlovely, but as little is she beautiful; in no other of Shakespeare's characters is the sensual attraction of a woman so completely shorn of its poetry."

Of all Shakespeare's works it is perhaps *Troilus and Cressida* which most nearly approaches *Don Quixote* of Cervantes. There is besides, a chivalrous fine feeling and sensual

tenderness in Troilus's love, but the melancholy of Shakespeare's matured perception sets its iron teeth in everything at this period of his life, and he looks upon absorption in love as senseless and laughable. As Brandes expresses it: "He shows us how blindly Troilus runs into the snare, giddy with happiness and uplifted to the heavens, and how the next moment he awakes from this intoxication, betrayed; but he shows it without sympathy, coldly. Therefore, the play never once arouses any true emotion, since Troilus himself never really interests. The piece blazes out, but imparts no warmth. Shakespeare wrote it thus, and therefore, while *Troilus and Cressida* will find many readers who will admire it, few will love it."

XIV.

It has not been the intention of the present writer in his efforts to show how Georg Brandes interprets Shakespeare, to deal with each of the plays. Such a task within a limited compass would be fair to neither Brandes nor the Bard of Avon. The purpose has been, however, to aid in making this Danish critic's work better known in America. The year 1923 seems to be particularly suited for such a presentation since Shakespeare once more occupies the public mind more largely than at any time since the tercentenary of his death, in 1916. For it was in this year, three hundred years ago, it is said, that the First Folio was published. Modern research tends to show that it was in all probability William Jaggard of

Fleet Street who published the First Folio and that the editors were John Hemmings and Henry Condell, fellow actors with Shakespeare, who were church wardens at Bradbury in 1623. They signed the dedication to the Earls of Pembroke and Montgomery and they gave assurance to the readers of that day that the versions of the thirty-six plays they presented—twenty for the first time—were not stolen or maimed, but perfect in their numbers.

It is not to be wondered, then, that Stratford-on-Avon made much of Shakespeare's birthday in this year of the tercentenary of the First Folio, nor that London joined in. Since this account concerns itself largely with Georg Brandes as an interpreter of Shakespeare, we shall perhaps be justified in quoting him in this matter of the First Folio, as follows: "He seems never to have sanctioned any publication, or to have read a single proofsheets. The 1623 folio of his plays, issued after his death by two of his actor-friends, purports to be printed 'according to the True Original Copies,' but this assertion is demonstrably false in numerous instances in which we can test it—where the folio, that is to say, presents a simple reprint, often with additional blunders, of the old pirated quartos, which must have been based either on the surreptitious notes of stenographers or on prompt-copies dishonestly acquired."

It will be for other Shakespeare scholars, those upholding the genuineness of the First Folio, to accept the challenge of Georg Brandes in this matter. With his usual fearlessness in

contravening the most cherished traditions, no matter what they may be, so long as he considers himself justified to do so, Brandes simply says what he thinks on this point. The present writer cannot escape the obligation to make mention of it since such a statement by the noted Danish critic is included in the *William Shakespeare, A Critical Study*.

The Optimism of Byron

M648864

Everything is against our appreciating the spirit and the age of Byron. The age that has just passed from us is always like a dream when we wake in the morning, a thing incredible and centuries away. And the world of Byron seems a sad and faded world, a weird and inhuman world, where men were romantic in whiskers, ladies lived, apparently, in bowers, and the very word has the sound of a piece of stage scenery. Roses and nightingales recur in their poetry with the monotonous elegance of a well-paper pattern. The whole is like a revel of dead men, a revel with splendid vesture and half-witted faces.

But the more shrewdly and earnestly we study the histories of men, the less ready shall we be to make use of the word 'artificial.' Nothing in the world has ever been artificial. Many customs, many dresses, many works of art are branded with artificiality because they exhibit vanity and self-consciousness: as if vanity were not a deep and elemental thing, like love and hate and the fear of death. Vanity may be found in darkling deserts, in the hermit and in the wild

beasts that crawl around him. It may be good or evil, but assuredly it is not artificial: vanity is a voice out of the abyss.

The remarkable fact is, however, and it bears strongly on the present position of Byron, that when a thing is unfamiliar to us, when it is remote and the product of some other age or spirit, we think it not savage or terrible, but merely artificial. There are many instances of this: a fair one is the case of tropical plants and birds. When we see some of the monstrous and flamboyant blossoms that enrich the equatorial woods, we do not feel that they are conflagrations of nature; silent explosions of her frightful energy. We simply find it hard to believe that they are not wax flowers grown under a glass case. When we see some of the tropic birds, with their tiny bodies attached to gigantic beaks, we do not feel that they are freaks of the fierce humour of Creation. We almost believe that they are toys out of a child's play-box, artificially carved and artificially coloured. So it is with the great convulsion of Nature which was known as Byronism. The volcano is not an extinct volcano now; it is the dead stick of a rocket. It is the remains not of a natural but of an artificial fire.

But Byron and Byronism were something immeasurably greater than anything that is represented by such a view as this: their real value and meaning are indeed little understood. The first of the mistakes about Byron lies in the fact that he is treated as a pessimist. True, he treated himself as such, but a critic can hardly have even a slight knowledge of Byron without knowing that he had the smallest amount of knowledge of himself that ever fell to the lot of an intelligent man. Byron's pessimism is better worth study than The real character of what is known as any real pessimism could ever be.

It is the standing peculiarity of this curious world of ours that almost everything in it has been extolled enthusiastically and invariably extolled to the disadvantage of everything else.

One after another almost every one of the phenomena of the universe has been declared to be alone capable of making life worth living. Books, love, business, religion, alcohol, abstract truth, private emotion, money, simplicity, mysticism, hard work, a life close to nature, a life close to Belgrave Square are every one of them passionately maintained by somebody to be so good that they re-

deem the evil of an otherwise indefensible world. Thus while the world is almost always condemned in summary, it is always justified, and indeed extolled, in detail after detail.

Existence has been praised and absolved by a chorus of pessimists. The work of giving thanks to Heaven is, as it were, divided ingeniously among them. Schopenhauer is told of as a kind of librarian in the House of God, to sing the praises of the austere pleasures of the mind. Carlyle, as steward, undertakes the working department and eulogises a life of labour in the fields. Omar Khayyam is established in the cellar and swears that it is the only room in the house. Even the blackest of pessimistic artists enjoys his art. At the precise moment that he has written some shameless and terrible indictment of Creation, his one pang of joy in the achievement joins the universal chorus of gratitude, with the scent of the wild flower and the song of the bird.

Now Byron had a sensational popularity, and that popularity was, as far as words and explanations go, founded upon his pessimism. He was adored by an overwhelming majority, almost every individual of which despised the majority of mankind. But when we come

to regard the matter a little more deeply we tend in some degree to cease to believe in this popularity of the pessimist. The popularity of pure and unadulterated pessimism is an oddity; it is almost a contradiction in terms. Men would no more receive the news of the failure of existence or of the harmonious hostility of the stars with ardour or popular rejoicing than they would light bonfires for the arrival of cholera or dance a breakdown when they were condemned to be hanged. When the pessimist is popular it must always be not because he shows some things to be bad, but because he shows some things to be good. Men can only join in a chorus of praise even if it is the praise of denunciation. The man who is popular must be optimistic about something even if he is only optimistic about pessimism. And this was emphatically the case with Byron and the Byronists. Their real popularity was founded not upon the fact that they blamed everything, but upon the fact that they praised something. They heaped curses upon man, but they used man merely as a foil. The things they wished to praise by comparison were the energies of Nature. Man was to them what talk and fashion were to Carlyle, what philosophical and religious

quarrels were to Omar, what the whole race after practical happiness was to Schopenhauer, the thing which must be censured in order that somebody else may be exalted. It was merely a recognition of the fact that one cannot write in white chalk except on a black-board.

Surely it is ridiculous to maintain seriously that Byron's love of the desolate and inhuman in nature was the mark of vital scepticism and depression. When a young man can elect deliberately to walk alone in winter by the side of the shattering sea, when he takes pleasure in storms and stricken peaks, and the lawless melancholy of the older earth, we may deduce with the certainty of logic that he is very young and very happy. There is a certain darkness which we see in wine when seen in shadow; we see it again in the night that has just buried a gorgeous sunset. The wine seems black, and yet at the same time powerfully and almost impossibly red; the sky seems black, and yet at the same time to be only too dense a blend of purple and green. Such was the darkness which lay around the Byronic school. Darkness with them was only too dense a purple. They would prefer the sullen hostility of the earth because amid all

the cold and darkness their own hearts were flaming like their own firesides.

Matters are very different with the more modern school of doubt and lamentation. The last movement of pessimism is perhaps expressed in Mr. Aubrey Beardsley's allegorical designs. Here we have to deal with a pessimism which tends naturally not towards the oldest elements of the cosmos, but towards the last and most fantastic fripperies of artificial life. Byronism tended towards the desert; the new pessimism towards the restaurant. Byronism was a revolt against artificiality; the new pessimism is a revolt in its favour. The Byronic young man had an affection of sincerity; the decadent, going a step deeper into the avenues of the unreal, has positively an affection of affectation. And it is by their fopperies and their frivolities that we know that their sinister philosophy is sincere; in their lights and garlands and ribbons we read their indwelling despair. It was so, indeed, with Byron himself; his really bitter moments were his frivolous moments. He went on year after year calling down fire upon mankind, summoning the deluge and the destructive sea and all the ultimate energies of nature to

sweep away the cities of the spawn of man. But through all this his sub-conscious mind was not that of a despairer; on the contrary, there is something of a kind of lawless faith in thus parleying with such immense and immemorial brutalities. It was not until the time in which he wrote 'Don Juan' that he really lost his inward warmth and geniality, and a sudden shout of hilarious laughter announced to the world that Lord Byron had really become a pessimist.

One of the best tests in the world of what a poet really means is his metre. He may be a hypocrite in his metaphysics, but he cannot be a hypocrite in his prosody. And all the time that Byron's language is of horror and emptiness, his metre is a bounding 'pas de quatre.' He may arraign existence on the most deadly charges, he may condemn it with the most desolating verdict, but he cannot alter the fact that on some walk in a spring morning when all the limbs are swinging and all the blood alive in the body, the lips may be caught repeating:

'Oh, there's not a joy the world can give
like that it takes away,

When the glow of early youth declines in
beauty's dull decay;

'Tis not upon the cheek of youth the blush
that fades so fast,
But the tender bloom of heart is gone ere
youth itself be past.'

That automatic recitation is the answer to
the whole pessimism of Byron.

The truth is that Byron was one of a class
who may be called the unconscious optimists,
who are very often, indeed, the most uncompromising conscious pessimists, because the
exuberance of their nature demands for an
adversary a dragon as big as the world. But
the whole of his essential and unconscious
being was spirited and confident, and that
unconscious being, long disguised and buried
under emotional artifices, suddenly sprang in-
to prominence in the face of a cold, hard, po-
litical necessity. In Greece he heard the cry
of reality, and at the time that he was dying,
he began to live. He heard suddenly the call
of that buried and sub-conscious happiness
which is in all of us, and which may emerge
suddenly at the sight of the grass of a mead-
ow or the spears of the enemy.

Pope and the Art of Satire

The general critical theory common in this and the last century is that it was very easy for the imitators of Pope to write English poetry. The classical couplet was a thing that anyone could do. So far as that goes, one may justifiably answer by asking anyone to try. It may be easier really to have wit, than really, in the boldest and most enduring sense, to have imagination. But it is immeasurably easier to pretend to have imagination than to pretend to have wit. A man may indulge in a sham rhapsody, because it may be the triumph of a rhapsody to be unintelligible. A man may pretend to be a poet: he can no more pretend to be a wit than he can pretend to bring rabbits out of a hat without having learnt to be a conjuror. Therefore, it may be submitted, there was a certain discipline in the old antithetical couplet of Pope and his followers. If it did not permit of the great liberty of wisdom used by the minority of great geniuses, neither did it permit of the great liberty of folly which is used by the majority of small writers. A prophet could not be a poet in those days, perhaps, but

at least a fool could not be a poet. If we take, for the sake of example, such a line as Pope's

‘Damm with faint praise, assent with
civil leer,’

the test is comparatively simple. A great poet would not have written such a line, perhaps. But a minor poet could not.

Supposing that a lyric poet of the new school really had to deal with such an idea as that expressed in Pope's line about Man:

‘A being darkly wise and rudely great.’
Is it really so certain that he would go deeper into the matter than that old antithetical jingle goes? I venture to doubt whether he would really be any wiser or weirder or more imaginative or more profound. The one thing that he would really be, would be longer. Instead of writing ‘A being darkly wise and rudely great,’ the contemporary poet, in his elaborately ornamented book of verses, would produce something like the following:—

‘A creature

Of feature

More dark, more dark, more dark than
skies

Yea, darkly wise, yea, darkly wise

Darkly wise as a formless fate

And if he be great
If he be great, then rudely great,
Rudely great as a plough that plies,
And darkly wise, and darkly wise."

Have we really learnt to think more broadly? Or have we only learnt to spread our thoughts thinner? I have a dark suspicion that a modern poet might manufacture an admirable lyric out of almost every line of Pope.

There is, of course, an idea in our time that the very antithesis of the typical line of Pope is a mark of artificiality. I shall have occasion more than once to point out that nothing in the world has ever been artificial. But certainly antithesis is not artificial. An element of paradox runs through the whole of existence itself. It begins in the realms of ultimate physics and metaphysics, in the two facts that we cannot imagine a space that is infinite, and that we cannot imagine a space that is finite. It runs through the inmost complications of divinity, in that we cannot conceive that Christ in the wilderness was truly pure, unless we also conceive that he desired to sin. It runs, in the same manner, through all the minor matters of morals, so that we cannot imagine courage existing ex-

cept in conjunction with fear, or magnanimity existing except in conjunction with some temptation to meanness. If Pope and his followers caught this echo of natural irrationality, they were not any the more artificial. Their antitheses were fully in harmony with existence, which is itself a contradiction in terms.

Pope was really a great poet; he was the last great poet of civilization. Immediately after the fall of him and his school come Burns and Byron, and the reaction towards the savage and the elemental. But to Pope civilization was still an exciting experiment. Its perruques and ruffles were to him what feathers and bangles are to a South Sea Islander—the real romance of civilization. And in all the forms of art which peculiarly belong to civilization, he was supreme. In one especially he was supreme—the great and civilized art of satire. And in this we have fallen away utterly.

We have had a great revival in our time of the cult of violence and hostility. Mr. Henley and his young men have an infinite number of furious epithets with which to overwhelm any one who differs from them. It is not a placid or untroubled position to be

Mr. Henley's enemy, though we know that it is certainly safer than to be his friend. And yet, despite all this, these people produce no satire. Political and social satire is a lost art, like pottery and stained glass. It may be worth while to make some attempt to point out a reason for this.

It may seem a singular observation to say that we are not generous enough to write great satire. This, however, is approximately a very accurate way of describing the case. To write great satire, to attack a man so that he feels the attack and half acknowledges its justice, it is necessary to have a certain intellectual magnanimity which realizes the merits of the opponent as well as his defects. This is, indeed, only another way of putting the simple truth that in order to attack an army we must know not only its weak points, but also its strong points. England in the present season and spirit fails in satire for the same simple reason that it fails in war: it despises the enemy. In matters of battle and conquest we have got firmly rooted in our minds the idea (an idea fit for the philosophers of Bedlam) that we can best trample on a people by ignoring all the particular merits which give them a chance of trampling upon

us. It has become a breach of etiquette to praise the enemy; whereas when the enemy is strong every honest scout ought to praise the enemy. It is impossible to vanquish an army without having a full account of its strength. It is impossible to satirise a man without having a full account of his virtues. It is too much the custom in politics to describe a political opponent as utterly inhumane, as utterly careless of his country, as utterly cynical, which no man ever was since the beginning of the world. This kind of invective may often have a great superficial success: it may hit the mood of the moment; it may raise excitement and applause; it may impress millions. But there is one man among all those millions whom it does not impress, whom it hardly even touches; that is the man against whom it is directed. The one person for whom the whole satire has been written in vain is the man whom it is the whole object of the institution of satire to reach. He knows that such a description of him is not true. He knows that he is not utterly unpatriotic, or utterly self-seeking, or utterly barbarous and revengeful. He knows that he is an ordinary man, and that he can count as many kindly memories, as many humane instincts, as many

hours of decent work and responsibility as any other ordinary man. But behind all this he has his real weaknesses, the real ironies of his soul: behind all these ordinary merits lie the mean compromises, the craven silences, the sullen vanities, the secret brutalities, the unmanly visions of revenge. It is to these that satire should reach if it is to touch the man at whom it is aimed. And to reach these it must pass and salute a whole army of virtues.

If we turn to the great English satirists of the seventeenth and eighteenth centuries, for example, we find that they had this rough but firm grasp of the size and strength, the value and the best points of their adversary. Dryden, before hewing Ahitophel in pieces, gives a splendid and spirited account of the insane valour and inspired cunning of the

‘daring pilot in extremity,’

who was more untrustworthy in calm than in storm, and

‘Steered too near the rocks to boast
his wit.’

The whole is, so far as it goes, a sound and picturesque version of the great Shaftesbury. It would, in many ways, serve as a very sound and picturesque account of Lord Ran-

dolph Churchill. But here comes in very pointedly the difference between our modern attempts at satire and the ancient achievement of it. The opponents of Lord Randolph Churchill, both Liberal and Conservative, did not satirise him nobly and honestly, as one of those great wits to madness near allied. They represented him as a mere puppy, a silly and irreverent upstart whose impudence supplied the lack of policy and character. Churchill had grave and even gross faults, a certain coarseness, a certain hard boyish assertiveness, a certain lack of magnanimity, a certain peculiar patrician vulgarity. But he was a much larger man than satire depicted him, and therefore the satire could not and did not overwhelm him. And here we have the cause of the failure of contemporary satire, that it has no magnanimity, that is to say, no patience. It cannot endure to be told that its opponent has his strong points, just as Mr. Chamberlain could not endure to be told that the Boers had a regular army. It can be content with nothing except persuading itself that its opponent is utterly bad or utterly stupid—that is, that he is what he is not and what nobody else is. If we take any prominent politician of the day—such, for example,

as Sir William Harcourt—we shall find that this is the point in which all party invective fails. The Tory satire at the expense of Sir William Harcourt is always desperately endeavoring to represent that he is inept, that he makes a fool of himself, that he is disagreeable and disgraceful and untrustworthy. The defect of all this is that we all know that it is untrue. Everyone knows that Sir William Harcourt is not inept, but is almost the ablest Parliamentarian now alive. Everyone knows that he is not disagreeable or disgraceful, but a gentleman of the old school who is on excellent social terms with his antagonists. Everyone knows that he is not untrustworthy, but a man of unimpeachable honor who is much trusted. Above all, he knows it himself, and is therefore affected by the satire exactly as any one of us would be if we were accused of being black or of keeping a shop for the receiving of stolen goods. We might be angry at the libel, but not at the satire; for a man is angry at a libel because it is false, but at a satire because it is true.

Mr. Henley and his young men are very fond of invective and satire: if they wish to know the reason of their failure in these things, they need only turn to the opening of

Pope's superb attack upon Addison. The Henleyite's idea of satirising a man is to express a violent contempt for him, and by the heat of this to persuade others and himself that the man is contemptible. I remember reading a satiric attack on Mr. Gladstone by one of the young anarchic Tories, which began by asserting that Mr. Gladstone was a bad public speaker. If these people would, as I have said, go quietly and read Pope's 'Atticus,' they would see how a great satirist approaches a great enemy: :

'Peace to all such! But were there one whose
fires

True genius kindles, and fair fame inspires,
Blest with each talent, and each art to please,
And born to write, converse, and live with
ease.

Should such a man——'

And then follows the torrent of that terrible criticism. Pope was not such a fool as to try to make out that Addison was a fool. He knew that Addison was not a fool, and he knew that Addison knew it. But hatred, in Pope's case, had become so great, and, I was almost going to say, so pure, that it illuminated all things, as love illuminates all things. He said what was really wrong with Addi-

son; and in calm and clear and everlasting colours he painted the picture of the evil of the literary temperament:

‘Bear like the Turk, no brother near the
throne,

View him with scornful, yet with jealous
eyes,

And hate for arts that caused himself to rise.

* * * *

Like Cato give his little Senate laws,
And sit attentive to his own applause.
While wits and templars every sentence raise.
And wonder with a foolish face of praise.’
This is the kind of thing which really goes to the mark at which it aims. It is penetrated with sorrow and a kind of reverence, and it is addressed directly to a man. This is no mock-tournament to gain the applause of the crowd. It is a deadly duel by the lonely seashore.

In current political materialism there is everywhere the assumption that, without understanding anything of his case or his merits, we can benefit a man practically. Without understanding his case and his merits, we cannot even hurt him.

Stevenson*

* 'Robert Louis Stevenson: A Life Study in Criticism.' By H. Bellyse Balldon. Chatto & Windus.

A recent incident has finally convinced us that Stevenson was, as we suspected, a great man. We knew from recent books that we have noticed, from the scorn of 'Ephemera Critica' and Mr. George Moore, that Stevenson had the first essential qualification of a great man: that of being misunderstood by his opponents. But from the book which Messrs. Chatto & Windus have issued, in the same binding as Stevenson's works, 'Robert Louis Stevenson,' by Mr. H. Bellyse Baildon, we learn that he has the other essential qualification, that of being misunderstood by his admirers. Mr. Baildon has many interesting things to tell us about Stevenson himself, whom he knew at college. Nor are his criticisms by any means valueless. That upon the plays, especially 'Beau Austin,' is remarkably thoughtful and true. But it is a very singular fact, and goes far, as we say, to prove that Stevenson had that unfathomable quality which belongs to the great, that this admiring student of Stevenson can number

and marshal all the master's work and distribute praise and blame with decision and even severity, without ever thinking for a moment of the principles of art and ethics which would have struck us as the very thing that Stevenson nearly killed himself to express.

Mr. Baildon, for example, is perpetually lecturing Stevenson for his 'pessimism'; surely a strange charge against the man who has done more than any modern artist to make men ashamed of their shame of life. But he complains that, in 'The Master of Ballantrae' and 'Dr. Jekyll and Mr. Hyde,' Stevenson gives evil a final victory over good. Now if there was one point that Stevenson more constantly and passionately emphasized than any other it was that we must worship good for its own value and beauty, without any reference whatever to victory or failure in space and time. 'Whatever we are intended to do,' he said, 'we are not intended to succeed.' That the stars in their courses fight against virtue, that humanity is in its nature a forlorn hope, this was the very spirit that through the whole of Stevenson's work sounded a trumpet to all the brave. The story of Henry Durie is dark enough, but could any one stand beside the grave of that sodden monomaniac and

not respect him? It is strange that men should see sublime inspiration in the ruins of an old church and see none in the ruins of a man.

The author has most extraordinary ideas about Stevenson's tales of blood and spoil; he appears to think that they prove Stevenson to have had (we use Mr. Baildon's own phrase) a kind of 'homicidal mania.' 'He (Stevenson) arrives pretty much at the paradox that one can hardly be better employed than in taking life.' Mr. Baildon might as well say that Dr. Conan Doyle delights in committing inexplicable crimes, that Mr. Clark Russell is a notorious pirate, and that Mr. Wilkie Collins thought that one could hardly be better employed than in stealing moonstones and falsifying marriage registers. But Mr. Baildon is scarcely alone in this error: few people have understood properly the goriness of Stevenson. Stevenson was essentially the robust schoolboy who draws skeletons and gibbets in his Latin grammar. It was not that he took pleasure in death, but that he took pleasure in life, in every muscular and emphatic action of life, even if it were an action that took the life of another.

Let us suppose that one gentleman throws a knife at another gentleman and pins him

to the wall. It is scarcely necessary to remark that there are in this transaction two somewhat varying personal points of view. The point of view of the man pinned is the tragic and moral point of view, and this Stevenson showed clearly that he understood in such stories as 'The Master of Ballantrae' and 'Weir of Hermiston.' But there is another view of the matter—that in which the whole act is an abrupt and brilliant explosion of bodily vitality, like breaking a rock with a blow of a hammer, or just clearing a five-barred gate. This is the standpoint of romance, and it is the soul of 'Treasure Island' and 'The Wrecker.' It was not, indeed, that Stevenson loved men less, but that he loved clubs and pistols more. He had in truth, in the devouring universalism of his soul, a positive love for inanimate objects such as has not been known since St. Francis called the sun brother and the well sister. We feel that he was actually in love with the wooden crutch that Silver sent hurtling in the sunlight, with the box that Billy Bones left at the 'Admiral Benbow,' with the knife that Wicks drove through his own hand and the table. There is always in his work a certain clean-cut angularity which makes us remember that he was

fond of cutting wood with an axe.

Stevenson's new biographer, however, cannot make any allowance for this deep-rooted poetry of mere sight and touch. He is always imputing something to Stevenson as a crime which Stevenson really professed as an object. He says of that glorious riot of horror, 'The Destroying Angel,' in 'The Dynamiter,' that it is 'highly fantastic and putting a strain on our credulity.' This is rather like describing the travels of Baron Munchausen as 'unconvincing.' The whole story of 'The Dynamiter' is a kind of humorous nightmare, and even in that story 'The Destroying Angel' is supposed to be an extravagant lie made up on the spur of the moment. It is a dream within a dream, and to accuse it of improbability is like accusing the sky of being blue. But Mr. Baildon, whether from hasty reading or natural difference of taste, cannot in the least comprehend the rich and romantic irony of Stevenson's London stories. He actually says of that portentous monument of humour, Prince Florizel of Bohemia, that 'though evidently admired by his creator, he is to me on the whole rather an irritating presence.' From this we are almost driven to believe (though desperately and against our will) that Mr.

Baildon thinks that Prince Florizel is to be taken seriously, as if he were a man in real life. For ourselves, Prince Florizel is almost our favorite character in fiction; but we willingly add the proviso that if we met him in real life we should kill him.

The fact is, that the whole mass of Stevenson's spiritual and intellectual virtues had been partly frustrated by one additional virtue—that of artistic dexterity. If he had chalked up his great message on a wall, like Walt Whitman, in large and straggling letters, it would have startled men like a blasphemy. But he wrote his light-headed paradoxes in so flowing a copy-book hand that every one supposed they must be copy-book sentiments. He suffered from his versatility, not, as is loosely said, by not doing every department well enough, but by doing every department too well. As a child, cockney, pirate, or Puritan, his disguises were so good that most people could not see the same man under all. It is an unjust fact that if a man can play the fiddle, give legal opinions, and black boots just tolerably, he is called an Admirable Crichton, but if he does all three thoroughly well, he is apt to be regarded, in the several departments as a com-

mon fiddler, a common lawyer, and a common boot-black. This is what has happened in the case of Stevenson. If 'Dr. Jekyll,' 'The Master of Ballantrae,' 'The Child's Garden of Verses,' and 'Across the Plains' had been each of them one shade less perfectly done than they were, everyone would have seen that they were all parts of the same message; but by succeeding in the proverbial miracle of being in five places at once, he has naturally convinced others that he was five different people. But the real message of Stevenson was as simple as that of Mahomet, as moral as that of Dante, as confident as that of Whitman, and as practical as that of James Watt.

The conception which unites the whole varied work of Stevenson was that romance, or the vision of the possibilities of things, was far more important than mere occurrences: that one was the soul of our life, the other the body, and that the soul was the precious thing. The germ of all his stories lies in the idea that every landscape or scrap of scenery has a soul: and that soul is a story. Standing before a stunted orchard with a broken stone wall, we may know as a mere fact that no one has been through it but an elderly fe-

male cook. But everything exists in the human soul: that orchard grows in our own brain, and there it is the shrine and theatre of some strange chance between a girl and a ragged poet and a mad farmer. Stevenson stands for the conception that ideas are the real incidents: that our fancies are our adventures. To think of a cow with wings is essentially to have met one. And this is the reason for his wide diversities of narrative: he had to make one story as rich as a ruby sunset, another as grey as a hoary monolith: for the story was the soul, or rather the meaning, of the bodily vision. It is quite inappropriate to judge 'The Teller of Tales' (as the Samoans called him) by the particular novels he wrote, as one would judge Mr. George Moore by 'Esther Waters.' These novels were only the two or three of his soul's adventures that he happened to tell. But he died with a thousand stories in his heart.

Rostand

When 'Cyrano de Bergerac' was published, it bore the subordinate title of a heroic comedy. We have no tradition in English literature which would justify us in calling a comedy heroic, though there was once a poet who called a comedy divine. By the current modern conception, the hero has his place in a tragedy, and the one kind of strength which is systematically denied to him is the strength to succeed. That the power of a man's spirit might possibly go to the length of turning a tragedy into a comedy is not admitted; nevertheless, almost all the primitive legends of the world are comedies, not only in the sense that they have a happy ending, but in the sense that they are based upon a certain optimistic assumption that the hero is destined to be the destroyer of the monster. Singularly enough, this modern idea of the essential disastrous character of life, when seriously considered, connects itself with a hyper-aesthetic view of tragedy and comedy which is largely due to the influence of modern France, from which the great heroic

comedies of Monsieur Rostand have come. The French genius has an instinct for remedying its own evil work, and France gives always the best cure for 'Frenchiness.' The idea of comedy which is held in England by the school which pays most attention to the technical niceties of art is a view which renders such an idea as that of heroic comedy quite impossible. The fundamental conception in the minds of the majority of our younger writers is that comedy is, 'par excellence,' a fragile thing. It is conceived to be a conventional world of the most absolutely delicate and gimcrack description. Such stories as Mr. Max Beerbohm's 'Happy Hypocrite' are conceptions which would vanish or fall into utter nonsense if viewed by one single degree too seriously. But great comedy, the comedy of Shakespeare or Sterne, not only can be, but must be, taken seriously. There is nothing to which a man must give himself up with more faith and self-abandonment than to genuine laughter. In such comedies one laughs with the heroes and not at them. The humour which steeps the stories of Falstaff and Uncle Toby is a cosmic and philosophic humour, a geniality, which goes down to the depths. It is not superficial read-

ing, it is not even, strictly speaking, light reading. Our sympathies are as much committed to the characters as if they were the predestined victims in a Greek tragedy. The modern writer of comedies may be said to boast of the brittleness of his characters. He seems always on the eve of knocking his puppets to pieces. When John Oliver Hobbes wrote for the first time a comedy of serious emotions, she named it, with a thinly-disguised contempt for her own work, 'A Sentimental Comedy.' The ground of this conception of the artificiality of comedy is a profound pessimism. Life in the eyes of these mournful buffoons is itself an utterly tragic thing; comedy must be as hollow as a grinning mask. It is a refuge from the world, and not even, properly speaking, a part of it. Their wit is a thin sheet of shining ice over the eternal waters of bitterness.

'Cyrano de Bergerac' came to us as the new decoration of an old truth, that merri-ment was one of the world's natural flowers, and not one of its exotics. The gigantesque levity, the flamboyant eloquence, the Rabelaisian puns and digressions were seen to be once more what they had been in Rabelais, the mere outbursts of a human sym-

pathy and bravado as old and solid as the stars. The human spirit demanded wit as headlong and haughty as its will. All was expressed in the words of Cyrano at his highest moment of happiness. 'Il me faut des geants.' An essential aspect of this question of heroic comedy is the question of drama in rhyme. There is nothing that affords so easy a point of attack for the dramatic realist as the conduct of a play in verse. According to his canons, it is indeed absurd to represent a number of characters facing some terrible crisis in their lives by capping rhymes like a party playing 'bouts rimes.' In his eyes it must appear somewhat ridiculous that two enemies taunting each other with insupportable insults should obligingly provide each other with metrical spacing and neat and convenient rhymes. But the whole of this view rests finally upon the fact that few persons, if any, today understand what is meant by a poetical play. It is a singular thing that those poetical plays which are now written in England by the most advanced students of the drama follow exclusively the lines of Maeterlinck, and use verse and rhyme for the adornment of a profoundly tragic theme. But rhyme has a supreme appropriateness for the

treatment of the higher comedy. The land of heroic comedy is, as it were, a paradise of lovers, in which it is not difficult to imagine that men could talk poetry all day long. It is far more conceivable that men's speech should flower naturally into these harmonious forms, when they are filled with the essential spirit of youth, than when they are sitting gloomily in the presence of immemorial destiny. The great error consists in supposing that poetry is an unnatural form of language. We should all like to speak poetry at the moment when we truly live, and if we do not speak it, it is because we have an impediment in our speech. It is not song that is the narrow or artificial thing, it is conversation that is a broken and stammering attempt at song. When we see men in a spiritual extravaganza, like Cyrano de Bergerac, speaking in rhyme, it is not our language disguised or distorted, but our language rounded and made whole. Rhymes answer each other as the sexes in flowers and in humanity answer each other. Men do not speak so, it is true. Even when they are inspired or in love they talk inanities. But the poetic comedy does not misrepresent the speech one-half so much, as the speech mis-

represents the soul. Monsieur Rostand showed even more than his usual insight when he called 'Cyrano de Bergerac' a comedy, despite the fact that, strictly speaking, it ends with disappointment and death. The essence of tragedy is a spiritual breakdown or decline, and in the great French play the spiritual sentiment mounts unceasingly until the last line. It is not the facts themselves, but our feeling about them, that makes tragedy and comedy, and death is more joyful in Rostand than life in Maeterlinck. The same apparent contradiction holds good in the case of the drama of 'L'Aiglon.' Although the hero is a weakling, the subject a fiasco, the end a premature death and a personal disillusionment, yet, in spite of this theme, which might have been chosen for its depressing qualities, the unconquerable paean of the praise of things, the ungovernable gaiety of the poet's song swells so high that at the end it seems to drown all the weak voices of the characters in one crashing chorus of great things and great men. A multitude of mottoes might be taken from the play to indicate and illustrate, not only its own spirit, but much of the spirit of modern life. When in the vision of the field of Wagram the horrible

voices of the wounded cry out, 'Les corbeaux, les corbeaux,' the Duke, overwhelmed with a nightmare of hideous trivialities, cries out, 'Ou, ou sont les aigles?' That antithesis might stand alone as an invocation at the beginning of the twentieth century to the spirit of heroic comedy. When an ex-General of Napoleon is asked his reason for having betrayed the Emperor he replies, 'La fatigue,' and at that a veteran private of the Great Army rushes forward, and crying passionately "Et nous?" pours out a terrible description of the life lived by the common soldier. Today when pessimism is almost as much a symbol of wealth and fashion as jewels or cigars, when the pampered heirs of the ages can sum up life in few other words but 'la fatigue,' there might surely come a cry from the vast mass of common humanity from the beginning "et nous?" It is this potentiality for enthusiasm among the mass of men that makes the function of comedy at once common and sublime. Shakespeare's 'Much Ado about Nothing' is a great comedy, because behind it is the whole pressure of that love of love which is the youth of the world, which is common to all the young, especially to those who swear they will die bachelors and old

maids. 'Love's Labour's Lost' is filled with the same energy, and there it falls even more definitely into the scope of our subject since it is a comedy in rhyme in which all men speak lyrically as naturally as the birds sing in pairing time. What the love of love is to the Shakespearian comedies, that other and more mysterious human passion, the love of death, is to 'L'Aiglon.' Whether we shall ever have in England a new tradition of poetic comedy it is difficult at present to say, but we shall assuredly never have it until we realize that comedy is built upon everlasting foundations in the nature of things, that it is not a thing too light to capture, but too deep to plumb. Monsieur Rostand, in his description of the Battle of Wagram, does not shrink from bringing about the Duke's ears the frightful voices of actual battle, of men torn by crows and, suffocated with blood, but when the Duke, terrified at these dreadful appeals, asks them for their final word, they all cry together, 'Vive l'Empereur!' Monsieur Rostand, perhaps, did not know that he was writing an allegory. To me that field of Wagram is the field of the modern war of literature. We hear nothing but the voices of pain; the whole is one phonograph of horror. It is

right that we should hear these things, it is right that not one of them should be silenced; but these cries of distress are not in life as they are in modern art the only voices, they are the voices of men, but not the voice of man. When questioned finally and seriously as to their conception of their destiny, men have from the beginning of time answered in a thousand philosophies and religions with a single voice and in a sense most sacred and tremendous, 'Vive l'Empereur.'

Charles II

There are a great many bonds which still connect us with Charles II., one of the idlest men of one of the idlest epochs. Among other things Charles II. represented one thing which is very rare and very satisfying; he was a real and consistent sceptic. Scepticism both in its advantages and disadvantages is greatly misunderstood in our time. There is a curious idea abroad that scepticism has some connection with such theories as materialism and atheism and secularism. This is of course a mistake; the true sceptic has nothing to do with these theories simply because they are theories. The true sceptic is as much a spiritualist as he is a materialist. He thinks that the savage dancing round an African idol stands quite as good a chance of being right as Darwin. He thinks that mysticism is every bit as rational as rationalism. He has indeed the most profound doubts as to whether St. Matthew wrote his own gospel. But he has quite equally profound doubts as to whether the tree he is looking at is a tree and not a rhinoceros.

This is the real meaning of that mystery

which appears so prominently in the lives of great sceptics, which appears with special prominence in the life of Charles II. I mean their constant oscillation between atheism and Roman Catholicism. Roman Catholicism is indeed a great and fixed and formidable system, but so is atheism. Atheism is indeed the most daring of all dogmas, more daring than the vision of a palpable day of judgment. For it is the assertion of a universal negative; for a man to say that there is no God in the universe is like saying that there are no insects in any of the stars.

Thus it was with that wholesome and systematic sceptic, Charles II. When he took the Sacrament according to the forms of the Roman Church in his last hour he was acting consistently as a philosopher. The wafer might not be God; similarly it might not be a wafer. To the genuine and poetical sceptic the whole world is incredible, with its bulbous mountains and its fantastic trees. The whole order of things is as outrageous as any miracle which could presume to violate it. Transubstantiation might be a dream, but if it was, it was assuredly a dream within a dream. Charles II. sought to guard himself against hell fire because he could not think hell itself

more fantastic than the world as it was revealed by science. The priest crept up the staircase, the doors were closed, the few of the faithful who were present hushed themselves respectfully, and so, with every circumstance of secrecy and sanctity, with the cross uplifted and the prayers poured out, was consummated the last great act of logical unbelief.

The problem of Charles II. consists in this, that he has scarcely a moral virtue to his name, and yet he attracts us morally. We feel that some of the virtues have been dropped out in the lists made by all the saints and sages, and that Charles II. was pre-eminently successful in these wild and unmentionable virtues. The real truth of this matter and the real relation of Charles II. to the moral ideal is worth somewhat more exhaustive study.

It is a commonplace that the Restoration movement can only be understood when considered as a reaction against Puritanism. But it is insufficiently realized that the tyranny which half frustrated all the good work of Puritanism was of a very peculiar kind. It was not the fire of Puritanism, the exultation in sobriety, the frenzy of a restraint, which passed away; that still burns in the heart of

England, only to be quenched by the final overwhelming sea. But it is seldom remembered that the Puritans were in their day emphatically intellectual bullies, that they relied swaggeringly on the logical necessity of Calvinism, that they bound omnipotence itself in the chains of syllogism. The Puritans fell, through the damning fact that they had a complete theory of life, through the eternal paradox that a satisfactory explanation can never satisfy. Like Brutus and the logical Romans, like the logical French Jacobins, like the logical English utilitarians, they taught the lesson that men's wants have always been right and their arguments always wrong. Reason is always a kind of brute force; those who appeal to the head rather than the heart however pallid and polite, are necessarily men of violence. We speak of 'touching' a man's heart, but we can do nothing to his head but hit it. The tyranny of the Puritans over the bodies of men was comparatively a rifle; pikes, bullets, and conflagrations are comparatively a trifle. Their real tyranny was the tyranny of aggressive reason over the cowed and demoralized human spirit. Their brooding and raving can be forgiven, can in truth be loved and revered, for it

is humanity on fire; hatred can be genial, madness can be homely. The Puritans fell, not because they were fanatics, but because they were rationalists.

When we consider these things, when we remember that Puritanism, which means in our day a moral and almost temperamental attitude, meant in that day a singularly arrogant logical attitude, we shall comprehend a for the revolt of the vices and of that empty little more the grain of good that lay in the vulgarity and triviality of the Restoration. The Restoration, of which Charles II. was a pre-eminent type, was in part a revolt of all the chaotic and unclassed parts of human nature, the parts that are left over, and will always be left over, by every rationalist system of life. This does not merely account for recklessness and horseplay which is sometimes more irritating than any vice. It accounts also for the return of the virtue of politeness, for that also is a nameless thing ignored by logical codes. Politeness has indeed about it something mystical; like religion, it is everywhere understood and nowhere defined. Charles is not entirely to be despised because, as the type of this movement, he let himself float upon this new tide

of politeness. There was some moral and social value in his perfection in little things. He could not keep the Ten Commandments, but he kept the ten thousand commandments. His name is unconnected with any great acts of duty or sacrifice, but it is connected with a great many of those acts of magnanimous politeness, of a kind of dramatic delicacy, which lie on the dim borderland between morality and art. 'Charles II.' said Thackeray, with unerring brevity, 'was a rascal but not a snob.' Unlike George IV. he was a gentleman, and a gentleman is a man who obeys strange statutes, not to be found in any moral text-book, and practices strange virtues nameless from the beginning of the world.

So much may be said and should be said for the Restoration, that it was the revolt of something human, if only the debris of human nature. But more cannot be said. It was emphatically a fall and not an ascent, a recoil and not an advance, a sudden weakness and not a sudden strength. That the bow of human nature was by Puritanism bent immeasurably too far, that it overstrained the soul by stretching it to the height of an almost horrible idealism, makes the collapse of the

Restoration infinitely more excusable, but it does not make it any the less a collapse. Nothing can efface the essential distinction that Puritanism was one of the world's great efforts after the discovery of the true order, whereas it was the essence of the Restoration that it involved no effort at all. It is true that the Restoration was not, as has been widely assumed, the most immoral epoch of our history. Its vices cannot compare for a moment in this respect with the monstrous tragedies and almost suffocating secrecies and villainies of the Court of James I. But the dram-drinking and nose-slitting of the saturnalia of Charles II. seem at once more human and more detestable than the passions and poisons of the Renaissance, much in the same way that a monkey appears inevitably more human and more detestable than a tiger. Compared with the Renaissance, there is something Cockney about the Restoration. Not only was it too indolent for great morality, it was too indolent even for great art. It lacked that seriousness which is needed even for the pursuit of pleasure, that discipline which is essential even to a game of lawn tennis. It would have appeared to Charles II.'s poets

quite as arduous to write 'Paradise Lost' as to regain Paradise.

All old and vigorous languages abound in images and metaphors, which, though lightly and casually used, are in truth poems in themselves, and poems of a high and striking order. Perhaps no phrase is so terribly significant as the phrase "killing time." It is a tremendous and poetical image, the image of a kind of cosmic parricide. There is on the earth a race of revellers who do, under all their exuberance, fundamentally regard time an enemy. Of these were Charles II. and the men of the Restoration. Whatever may have been their merits, and as we have said we think that they had merits, they can never have a place among the great representatives of the joy of life, for they belonged to those lower epicureans who kill time, as opposed to those higher epicureans who make time live.

Of a people in this temper Charles II. was the natural and rightful head. He may have been a pantomime King, but he was a King, and with all his geniality he let nobody forget it. He was not, indeed, the aimless flaneur that he has been represented. He

was a patient and cunning politician, who disguised his wisdom under so perfect a mask of folly that he not only deceived his allies and opponents, but has deceived almost all the historians that have come after him. But if Charles was, as he emphatically was, the only Stuart who really achieved despotism, it was greatly due to the temper of the nation and the age. Despotism is the easiest of all governments, at any rate for the governed.

It is indeed a form of slavery, and it is the despot who is the slave. Men in a state of decadence employ professionals to fight for them, professionals to dance for them, and a professional to rule them.

Almost all the faces in the portraits of that time look, as it were, like masks put on artificially with the perruque. A strange unreality broods over the period. Distracted as we are with civic mysteries and problems, we can afford to rejoice. Our tears are less desolate than their laughter, our restraints are larger than their liberty.

NOTE

These essays have already appeared in one or the other of the following publications: The New York Times, The Dial, The Freeman and are printed here with the kind permission of the editors.

DEDICATED TO A. R. ORAGE,

whose intellectual vigour is only surpassed by the goodness of his heart, and whose criticism and appreciation were of such inestimable value to me in the days when I first began writing, sitting under the Catherine Pear-tree, outside the saddle-room at Montacute, in the County of Somerset.

CUP-BEARERS OF WINE AND HELLEBORE

FRANCOIS RABELAIS

Few books have managed to draw into their pages more of the unregenerate body of the earth than have the works of François Rabelais. In truth these exultant and extravagant pages seem writ, as it were, with the actual rank sweat of our planet, with the bitter, salt sweat that for ever rises from the commons and goose-greens of the world, from those commons and goose-greens whose gay levels, for all their buttercups and daisies, are soundly chequered with round, flat, homely cow-pats.

But what perhaps especially separates this good great work from all others is the fact that amid its boisterous joviality, its sly whimsicality, its monumental and monstrous bawdry, one comes continually upon utterances of the gravest and most profound significance. The riotous earth of Rabelais's conception rolls and rollicks it under the still, frosty light of the eternal stars like a coopered barrel of beer tumbled and jogged across the floor of the universe; and scarcely have we found time to register a protest against the acceptance of such jolly friskings, maintaining, as best we may, that life has more in it than just that, when, behold! we hear words spoken above the music of the spheres, above the hum of the

outer darkness, which cause us to discover, with a sense of infinite relief, that, as a matter of fact, nobody understands better than Rabelais the desperate nature of the human situation. And undoubtedly it is this very solicitude about our fate, so vigorous and yet so tender, that to a great extent explains the hold that this work has had upon men's minds for close upon four hundred years.

Rabelais was born near Chinon, and his earliest recollections had to do with the fat, grain-growing, grape-producing fields of Touraine. He knew what it was to keep starlings from the vineyards in springtime; to pick a pannier-full of purple mulberries in August; to thrash a walnut tree in October; and to spend long, drowsy, fireside hours sitting in the great family-kitchen during the winter months. It was doubtless the memory of one such evening, stored away in his mind for years afterwards like a cask of unforgotten wine in a rich cellar, that inspired him to write those mellow sentences which have to do with the home-life of the most good, most royal Grangousier, "who after supper warmeth his b——s by a good clear grate fire, and waiting upon the broiling of some chestnuts is very serious in drawing scratches on the hearth, with a stick burnt at one end, wherewith they did stir up the fire, telling to his wife and the rest of the family pleasant old stories and tales of former times."

Shut away in a monastery from such happy surroundings when still only a lad, his energy for many years found expression in absorbing the new learning. But alas! these pursuits

only led him into trouble. His cell was searched and was found to contain books in that language which the instinct of his ignorant fellow-monks suspected, not altogether unjustly perhaps, as being entirely inimical to the spirit of mediæval Christianity. To understand Greek with its strange, clear-cut, artistic lettering, with its lucid, uninhibited methods of reasoning, there could not but be definite evil in that! But perhaps their eccentric intellectual brother had in other ways provoked their hostility. Certain legends have come down to us concerning Rabelais's conduct at Fontenay-le-Comte which ought to be remembered. Had he not on a certain famous festival played the devil with the lustral water in the chapel-stoups, and with even more malice on another occasion diluted their refectory-wine with some villainous aphrodisiac concoction—that same red wine which they had trodden out in the autumn and had hoped to whiff up in the winter?

Rabelais escaped further persecution at the hands of the Grey brothers by appealing to a higher authority, to no less a person than Pope Clement VII. To use influential personages as so many stalking-horses was a practice which in later life he reduced to a fine art. Until the day of his death he was content to remain a sly assailant of obscurantism, ambushed behind this or that formal potentate. It is clear he had no predilection for the stake. On every side he saw men being burnt alive for their opinions. "Now God forbid," he cried, "that I should die this death! for I am by nature sufficiently dry

already without heating myself any further." And between Catholics and Protestants he had a hard enough time of it to keep a whole skin on his back. Orthodox churchmen would always have been glad to lay hands on him, while Robert Estienne from his refuge at John Calvin's side kept inveighing against "the theologians of Paris for not burning Rabelais, the atheist."

What then does Rabelais, this great modern ancient, teach? Above everything a courageous acceptance of existence for its own sake. He is no mincing idealist. He loves the hurly-burly, the large, brutal transactions of life. He feels no misgivings. He accepts the hungry, carnivorous world as he finds it, full of "jolly pugs and well-mouthed wenches," full of "excellent godebillios of the dun ox (you know with the black streak)" and monstrous mares of "burnt sorrel hue" with "slouch ears, like the goats in Languedoc." He likes a world in which there are forests "most horribly fertile and copious in dorflies, hornets and wasps," and where "a pair of breeches is not so easily got; I have experience of it"; and yet at the same time where a man may sit an hour or two "at Innocents the pastry cook over against the painted wine shop at Chinon," or go to mass with a thick-covered breviary weighing heavy with its grease and clasps, or visit the kitchen "to see what roast meat is on the spit," or "pass through certain meadows, or grassy places to behold the trees and plants," or, when night is full, look out of the castle window "to see the face of the sky."

He is intolerant of all that is false and artificial. A goose-step education, an education that is narrow, insular and standardized, exists he declares, "but to bastardize good and noble spirits and to corrupt all the flower of youth"; better to follow the good Gargantua's example than to allow the natural philosophic temper of one's mind to be spoiled by the adhesion of so many false, stereotyped and dead ideas; better in fact to study "some paltry half-hour with eyes fixed upon a book but with one's mind in the kitchen," and then go "to see a coney ferrited or caught in a gin . . . or to lie tumbling in some fair meadow, unnestling of sparrows, taking of quails, and fishing for frogs and crabs."

Hypocrites of every cast are as bitter to Rabelais's taste as the pilgrims in his salad were to Gargantua. Of doctors he says, "a hundred devils leap into my body if there are not more old drunkards than old physicians." As for monks, "the very shadow of the steeple of an abbey," he declares, "is fruitful." Picrochole, who is used by him as the exact prototype of an evil mischief-making monarch, he is content to leave as a "common porter at Lyons as testy and pettish in humor as ever he was before." "These devilish kings which we have," he says, "are but as so many calves; they know nothing and are good for nothing but to do a thousand mischiefs to their poor subjects, and to trouble all the world with war for their unjust and detestable pleasure."

He is opposed to all that is mean, small,

conventional; to the proprieties which are invented to restrain and hold back the free and frank expression of natural emotion.

"Never trust those men that always peep out at one hole."

"Nor can there be any greater dotage in the world than for one to guide and direct his courses by the sound of a bell, and not by his own judgment and direction."

The fact is that there is more in these works than Mr. John Sumner and the rest of the "rabble of great pocky loggerheads" who clamor against them are able to discern. Nobody can write of Our Lord with more devotion than can Rabelais when he is so disposed. Consider Friar John's stout words as he sipped his wine. "O how good is God, that gives us of this excellent juice! I call him to witness, if I had been in the time of Jesus Christ, I would have kept him from being taken by the Jews in the garden of Olivet. And the devil fail me, if I should have failed to cut off the hams of those gentlemen-apostles who ran away so basely after they had well supped, and left their good master in the lurch."

What passage in all literature could be found more truly religious than Pantagruel's explanation of that mysterious cry, "Pan is dead," which was heard over the waves of the Mediterranean at the time that Tiberius Cæsar sat upon the Imperial throne! Coming as it does in the very midst of such vast, grotesque, gorbellied merriment, it strikes one to the heart as might some graceful, magnanimous bene-

diction heard unexpectedly from the lips of an heroic drunkard. We are laughing all of us "like a swarm of flies," and suddenly we find ourselves listening to this fine, ironic tribute to that most incredible and desperate of man's fancies which conceives as possible that the son of God actually in very truth came down to visit the high roads, the farmyards, the pantries of the earth, from beyond the familiar aura of the moon, from beyond the wide expanses of our solar system, from beyond the outer borders of the cold constellations.

For my part I understand it of that great Saviour of the faithful who was shamefully put to death at Jerusalem by the envy and wickedness of the doctors, priests and monks of the Mosaic law. . . . He is the good Pan. . . . At his death, complaints, sighs, fears and lamentations were spread through the whole fabric of the Universe, whether heavens, land, sea or hell. The time also concurs with this interpretation of mine; for this most good, most mighty Pan, our only Saviour, died near Jerusalem during the reign of Tiberius Cæsar. Pantagrue, having ended his discourse, remained silent and full of contemplation. A little while after we saw the tears flow out of his eyes as big as ostrich's eggs.

But quite apart from Rabelais's attitude toward Christianity, his mood with regard to all philosophic speculations seems to be penetrated with the profoundest wisdom of the ages. Panurge in referring to the heroes says, "May I never be damned if I was not so much a lobcock as to believe they had been immortal, like so many fine angels." To which Pantagrue answers with sublime and noble simplicity, "I

believe that all intellectual souls are exempted from Atropos's scissors."

Indeed, so strong is the underswirl of enigmatic revelation throughout these pages that one comes almost to believe that this wayward, sophisticated French monk was in some especial way conversant with the hidden secrets of the universe:

"Fate leads the willing and the unwilling draws."

"All things tend to their end."

"Good hope lies at the bottom."

Finally, in full recognition of the treacherous nature of all theological conceptions, he commits his readers through the mouth of the Priestess Bacbuc into the almighty protection "of that Intellectual sphere whose centre is everywhere and circumference nowhere."

How we would like to have had an authentic glimpse of the old man during those last years when he was officiating as parish priest in the village near Paris! Did he also, like the honest schoolman, confess at last that he had finished with argumentations and had come to that pass when he "wanted nothing but a cup of good wine, a good bed, my back to the fire, my belly to the table, and a good deep dish"? It may well have been so, for he had passed through many dangers and up to the last must have felt himself fortunate in that he escaped the fate of Euclion's cock, "which cock, for having by his scraping uncovered a treasure, had his neck twisted round." From certain legendary

accounts of his death, it would seem that he accepted that last experience with characteristic equanimity; and indeed who would dare to assert that there has ever lived an intellectual spirit more worthy "to receive the gentlest, the deserved, the last kind embraces of the great Alma Mater, the earth"?

JONATHAN SWIFT

It is very certain that there never has lived a man who would have made a better subject for a psycho-analyst than Jonathan Swift, the ferocious, splenetic, and impotent Dean, of St. Patrick's Cathedral, Dublin.

Proud with an inordinate pride, cynically frank and yet pestered by strange and unaccountable inhibitions, the "mad parson" lived out his long life, dependent upon human beings and yet disdainful of them, attracted by the crazy drama of existence and yet at the same time out of conceit with it. Small wonder that the anomalies and contradictions of such a character should have captivated the minds of succeeding generations for nearly two hundred years! Was this man, the savagery of whose glance was actually potent enough to kill, the mere victim of some morbid physical derangement; or did the madness that fell upon him at last owe its origin to a deeper and more terrible cause? It is really possible that one glimpse into the ghastly secret designs of life is sufficient to shatter, in certain abnormally sensitive temperaments, those delicately adjusted cerebral nerves which distinguish mortal men from the beasts of the field? When we remember the fate of Pascal, of Nietzsche, of Guy de Maupassant, each one of them gifted with just this dangerous, penetrating insight, our hearts quail lest this indeed be so.

With that irony which was characteristic of him, Swift himself affected to attribute his malady to a simple enough cause, to nothing else, in fact, than a youthful surfeit of golden pippins.

"Dropped in Ireland by a perfect accident" he was educated at Dublin University, his expenses being borne by his uncle Godwin, an eminent lawyer, whose benevolence did not save him from the hot tongue of his tetchy nephew who in his autobiographical notes gravely declares him to have been "a little too dexterous in the subtler parts of the law." Swift's mind in those days, as he himself tells us, "was like a conjured spirit which would do mischief if I did not give it employment."

From Dublin he went to Moor Park at Surrey as a secretary to Sir William Temple. His *locus standi* in this capacity was at first ill-defined and one can well imagine the anguish that the youth's haughty spirit underwent—already racked with the travail of genius—at finding himself in the position of an upper servant in the well-appointed country house of a pompous English gentleman. A cold, distant look from Sir William was sufficient, so Swift tells us, to put him at odds with himself for days together. In such an atmosphere, stiff, formal, and correct, the youthful satellite was at pains to exercise an ironic submission that ate into his very soul. It was as though a leopard were being fed on lettuce in a rabbit-hutch, or a vulture on groundsel seed in a parrot's cage.

It was a habit of his to relieve the constraint

from which he suffered by rushing off at top speed, whenever occasion offered, to the summit of a neighboring hill. There was only one congenial spirit in that conventional community, a little girl, probably a bastard daughter of Sir William Temple. Something about the sprightly personality of this child thawed the "chilly temper" of the awkward tutor. They were together always, in the cool, spacious library, in the stately oak-paneled hall, and in the ornate stone summer houses of the well ordered garden. "From those hours," as has been so well said, "the child and man went hand in hand into the eternity of sorrowful fame."

It was not, however, only the companionship of Stella which relieved the tedium and ignominy of those days; for it was Swift's custom to make periodical visits to his mother, walking, hedge-stick in hand, all the way from Surrey to Leicester. During these excursions he would sleep at the poorest ale-houses, paying sixpence for clean sheets and, in order the more to taste and relish the precious hours of his freedom, would hold familiar intercourse with the human riffraff which is ever to be found up and down the English turnpike roads. In after years he put such experiences to good use, and it may well be that his peculiar style of writing, at once restrained and outspoken, owes much of its vigor to the curious juxtaposition in which he found himself between ministers of State and hedge rogues. We know that William III as he strolled along the trim borders of Sir William Temple's kitchen gar-

den expressed his liking for the young secretary by instructing him about the cutting of asparagus after the Dutch manner; may we not also conclude that the eccentric youth picked up from the acquaintanceships that he made on his Majesty's highways, other scraps of information equally pertinent to life? Just as at Sir William's board, he was in a position to observe at first hand the foibles and vanities of the great, so on many a sunny settle throughout the midland shires of England he was a constant witness of the grosser peculiarities of the rude and baseborn.

Sir William Temple died in 1699 and Swift, who had already taken orders, now entered upon that career of political pamphleteering which eventually won for him so exceptional a position in the history of those times.

In his "Battle of the Books" he had already showed unmistakable indications of his power. Could there be, for example, a more humorously graphic description of the sentiments of a testy spider disturbed by the foundering movements of a bee entangled in its web?

'A plague split you,' said he, 'for a giddy son of a whore. Is it you with a vengeance that have made this litter here? Could not you look before you, and be damned? Do you think I have nothing better to do, in the Devil's name, but mend and repair after your arse?'

This work was followed by the "Tale of a Tub," that extraordinary, profane and sceptical piece of writing in which it would seem that Swift wittingly offended against his own maxim that "the want of a belief is a defect which

ought to be concealed when it can not be overcome." Under the guise of the elder brother Peter he directs his rancorous ridicule against the Roman Catholic Church with all its nice regulations for human conduct. Peter it was who insisted that brothers Martin and Jack—the Church of England and the dissenters—must "by no means break wind at both ends together, without manifest occasion." Even the divine consolation of the holy sacrament is treated with the utmost irreverence as a "remedy for the worms, especially those of the spleen"; and in reference to the perennial dispute concerning transubstantiation he makes the eldest brother roundly assert that the sacred wafer itself, far from being merely bread is "as true natural mutton as any to be had in Leadenhall Market."

In spite of such literary conceits, however, Swift remained throughout his life a zealous Champion of the Church of England as by law established. It was chiefly for its sake that he came to play the part of a turncoat and left the Whigs for the Torys, through whose patronage he won for himself the Deanship of St. Patrick's, Dublin.

Once safely installed in his deanery he lived in Ireland, "like a poisoned rat in a hole," the plague and scourge of all tyrants and at the last the bitter, misanthropic censor of the whole human race. "Gulliver's Travels" even he tells us, was written "to vex rather than divert the world"; and this we can readily believe when we read passages such as the one describing the infant Yahoo, "I observed the

young animal's flesh to smell very rank and the stink was somewhat between a weasel and a fox, but more disagreeable."

Perhaps it would be best, in order to fully acquaint the reader with his temper, to gather together a few haphazard quotations from his works.

I love only individuals, I hate and detest that animal called man.

When a true genius appears in this world, you may know him by this sign, that the dunces are all in confederacy against him.

The merriest countenances are in mourning-coaches.

No wise man ever wished to be younger.

A very little wit is valued in a woman, as we are pleased with a few words spoken plain by a parrot.

It is said of the horses in the vision that their power is in their mouths and in their tails. What is said of horses in the vision, in reality may be said of women.

What a fund of nice and curious observation is revealed in his scandalous "Directions to Servants." How these outrageous sentences seem at once to get under the lid of the decorous indelicacies of society, opening them wide, so to speak, to the sanative influence of light and air. Such "unconfined humor" has upon it the very stamp and signature of the man who is described as never laughing but "sucking in his cheeks to prevent it" when such a mood was upon him.

Rules that Concern All Servants in General.

When your master or lady calls a servant by name, if that servant be not in the way, none of you are to answer, for then there would be no end to your drudgery. Never come till you have

been called three or four times; for nought but dogs will come at the first whistle; and when the master calls 'who's there?' no servant is bound to come. 'Who's there' is no name.

Directions to the Nurse.

If you happen to let the child fall and lame it, be sure never confess it, if it dies all is safe.

. to the House Maid.

When you have scoured the brasses and irons in the parlour-chimney, lay the foul wet clout on the next chair that your Lady may see that you have not neglected your work.

His poetry is just as unpardonable, revealing a propensity to expose everything, to gnaw down to the very bone. Probably Dryden was right when he said, "Cousin Swift, you will never make a poet," and yet these rhyming, facile verses will always possess a curious fascination for certain minds, for they express, in poetry that is no poetry, a morbid reaction to the visible world. Was his incipient sickness revealing itself already in his tabid pre-occupation with the excremental? Only a madman surely could make such giddy sport with dung and litter! Or is this fetid, but at the same time strangely formal poetry merely the outcome of a spiritual sensitiveness recoiling with inexpressible bitterness from an ideal of beauty which does not bear too close an inspection?

It is, however, in his prose that one finds Swift's real power. How often when injustice is rampant in the world and nothing said, have lovers of liberty envied that inimitable style, whose searing quality of venomous satire could not only dislodge the mighty from their seats, but alter the very laws of the land!

Throughout what we may call the militant years of Jonathan Swift's life, Stella was not the only young girl who, in the words of Dr. Johnson "from being proud of his praise grew fond of his person." In following his life it becomes apparent that there was something in the morbid construction of his uncommon temperament that enabled him to derive a wanton and perverted satisfaction from mental intercourse with immature women. Both in his journals to Stella and in his letters to Vanessa this curious preoccupation is quite evident. It was this denaturalized and extraordinary man's vice to make love not with his body but with his genius. This perilous pastime became a kind of obsession with him, an obsession which perhaps alone reconciled him to an existence for which as the years passed his distaste became more and more emphasized. His love letters are all written in ambiguous and masked language as though he half anticipated the fierce searchlight of inquiry that would be poured upon their pages by future generations. "Farewell, dear Sirrahs, dearest lives; there is peace and quiet with M D and nowhere else."

Esther Vanhomrigh, as the other Esther had done before her, followed her equivocal lover to Ireland only to discover that she was conjured to practise the utmost discretion with regard to the amphibolous relationship. "You have taught me to distinguish and now you leave me miserable," she wrote reproaching the Dean for his judicious abstentions.

Stella took alarm at the presence of a rival and managed to persuade Swift into marrying

her, but even her triumph proved elusive for the Dean insisted upon the ceremony being performed with such rigid secrecy that to this day there are to be found those who hold to the opinion that it never took place at all.

Everybody knows what followed. Vanessa, distressed by a rumour of the wedding, wrote to Stella to have the matter cleared up. When the impolitic epistle was put into Swift's hands, he rode in a fit of blind rage to Marlay Abbey. He reached the place in the early morning and, going straight up to the bed-room of the unhappy woman, threw the incriminating document at her feet and turned on his heel without a word. A week later Vanessa was dead and underground, killed, so it was said, by the single venomous, asplike look that her ferocious lover had given her.

There are other equally strange stories connected with him. One of the most significant of these is recounted by Delaney. On one occasion he saw the Dean hurrying away from Archbishop King to whom he had been speaking. "You have just met the most unhappy man who ever lived," was the only comment vouchsafed by the circumspect prelate. What it was that had been said or confessed during that historic conversation has never been divulged. But whatever horrible thing was haggarding the unfortunate man, worse was to follow.

In January 1732, Stella died. She was buried at midnight in the Cathedral. Swift was too ill to be present; and indeed had to be carried to the back of the deanery so as not to be

distracted into a frenzy by the lights that shone into his room from the lanterns of those who were occupied in putting into church-yard mould the body of the only woman he had ever loved. From that hour he never lifted "his sorry head" in mirth again. A blank and hopeless gloom wrapped itself about him. The record of those years is one of the most terrible episodes in all literary history. Never for a moment was he unaware of his impending doom. He knew that he would inevitably go mad.

He was observed one day standing under an elm tree the top branches of which were already fading. "I shall be like that; I shall die first at the top," he said. Once, when a heavy glass had fallen from its place nearly crushing him, and he was congratulated on his escape, he remarked simply, "I wish it had killed me." A servant passing near his room overheard the words of a desperate prayer, "that he should be taken away from the evil to come."

On the anniversaries of his birthday, when all Ireland was agog to do honour to the author of the "Drapier's Letters," and "A Modest Proposal," he would sit quietly at home and read the third chapter of the book of Job, wherein that ancient, long-suffering Jew curses the day on which he was born. Already he began to feel a change coming over him. "Good God! what a genius I had when I wrote that book!" he said once, as he turned over the pages of the "Tale of a Tub." But worse was to follow.

An abscess as large as a hen's egg formed

over his left eye, and for a month the aging man howled out to the night in abject torment. Five servants could hardly prevent him from tearing out his own eyeball, and when the agony had passed he was left a lunatic. But was he? Occasionally, in spite of the strange aphasia by which he was afflicted, he would be heard to mutter words which to the awe of those who loved him seemed to denote that even yet, in some obscure way, he retained a ghastly and incredible consciousness.

More years passed by and still up and down the wide staircase and through the silent rooms of the deanery the figure that had been Jonathan Swift paced to and fro. Like a caged animal he ate his food—little chopped up pieces of meat—as he walked, and once he was found, with horrible contorted face, threatening his own image in one of the tall mirrors. Once his cousin called to see him. "Go, go," he shrieked, and then pointing significantly to his head, "My best understanding." Once there escaped from him the simple tragic words, "I am a fool"; and this from the lips of the man whom Addison had not hesitated to call the greatest genius of his age! Once more the devoted populace, as his birthday came round, lit bonfires, and paraded the streets, and rang the Dublin bells. The noise of their rejoicing came in through the open window and, to the dismay of the attendants, the idiot inmate uttered the words, "'Tis folly, better let it alone." At another time a knife was left within his reach, and he who removed it was shocked to hear as though in rebuke for

his own prudent action, the ambiguous and impressive utterance, "I am what I am."

He died in his seventy-eighth year, October 19, 1745. He lies buried in his own cathedral near the grave of Esther Johnson. Amongst the letters that he left, as though he wished even after death to bewilder the over-curious concerning the true significance of the deepest emotions of his life, was found an envelope containing one of Stella's tresses, "black as a raven's wing," with the four words, "only a woman's hair" inscribed upon it.

His worldly goods were left by his will for the construction of a mad house.

MATTHEW PRIOR

Matthew Prior was undoubtedly one of the principal precursors of the Augustan age of English poetry; however, born as he was in 1664, his lighter verses are redeemed somewhat from the tedious classical anaesthesia that we associate with the eighteenth century by the fact that they still carry with them a suggestion of the delightful sophisticated levity which belonged to the Caroline epoch.

Matthew Prior, so we are assured by Dr. Johnson, was "one of those that have burst out from an obscure original to great eminence." Whether or not the ancient county of Dorset is justified in claiming Wimborne Minster as the place of his actual birth, it is clear that it was from the immediate vicinity of that old-world country town that his progenitors sprang. Indeed it is within the memory of our own generation that the last of the family, Martha Prior, daughter of a simple shepherd, died at Godmanston.

The first authentic glimpse we get of the young poet is as a wine carrier in his uncle's tavern in London. It was here that Lord Dorset discovered him, Horace in hand, and with that generous munificence, so characteristic of the restoration, paid for his schooling at Westminster and later for his entrance to St. John's College, Cambridge. Matthew Prior it is quite evident made the best of his opportunities. He

had a good "sense of direction," if we may be permitted to use that invidious modern phrase, and cultivated with the utmost zeal useful friendships. In London during the vacations he sought the company of the wits and was one of those who frequented Wills' Coffee-House and who during the long drawn-out evenings of the late summer would sit on the balcony of that famous resort "proud to dip a finger and thumb into Mr. Dryden's snuff box." This privilege, however, in no way prevented him from cleverly parodying in his *City Mouse* and *Country Mouse* the famous pro-Catholic poem of the Poet Laureate. It was, in fact, upon this undergraduate exercise that his future career was founded. He became secretary to the Ambassador at the Hague and, because of a series of chances, remained for several years as England's chief representative "at this central cogwheel of the cumbrous engine" of the Coalition.

From a pecuniary point of view the berth was not as satisfactory as it might have been, and Prior's letters from now on are filled with fretful references to the inadequacy of the Government's payment of twenty shillings a day with an allowance for "reasonable extraordinaries." He was never tired of deploring the fact that his creditors, as he put it, "were brisker in business than the Treasury." "Who has ever heard," he exclaimed, "of a professed panegyric poet that was able to advance two guineas to the public?" In vain he pointed out to the preoccupied authorities at home "that a little house, this winter, would be convenient

in so cold a country as Holland." His agitated pleas were greeted with evasions and procrastinations and the poet-diplomatist was left "to scramble at ordinaries with Switzers or French Protestants." One of his own poems suggests, however, that his time was not entirely occupied with his ambassadorial duties. He too had, we may assume, as well as another, his margins, his moments, his golden week-ends when it mattered not a rush to him whether or no the "disaffected" reached the shores of England.

"In a little Dutch-chaise on a Saturday night
On my left hand my Horace, a Nymph on my
right."

As the years passed his financial straits were considerably relieved by a sinecure secretaryship in Dublin, from which he drew for several years, though never setting foot in Ireland, remuneration to the tune of nearly £1,000 a year.

From the Hague he was eventually transferred to Paris. His letters from that capital are full of entertaining gossip information. He was shown over the royal palace and as he viewed Le Brun's gorgeous pictures representing the victories of Louis XIV was asked whether Hampton Court could be said to rival such a display. "The monuments of my master's actions," he replied appositely enough, "are to be seen everywhere but in his own house." He visited the court of the exiled King of England and though the account he gives of that fallen monarch was not exactly

in the best of taste it has its own interest: "I faced old James the other day at St. Cloud. Vive Guillaume! You never saw such a strange figure as the old bully is, lean, worn and riv'led."

On his return to England he abandons his friends the Whigs and turns Tory, actually for a short time gaining a seat in the House of Commons, for which act of treachery, on the death of Queen Anne and the return of the opposition, he is held in custody for two years and is, so he fancies, in no small danger of losing his life.

But even so he is still full of resource. He conceives the fortunate idea of issuing a "tall folio" of his poems done on "paper imperial and the largest in England." He manages to interest innumerable people in his project: Jonathan Swift even exerts himself and extracts not less than £200 from what he called the "hedge country" of his residence. The volumes are sold for two guineas each and Matthew Prior is soon rewarded by having four thousand pounds in his fob and this with an equal sum which he owed to the generosity of Lord Oxford and with the money due to him from his fellowship at John's ensures the poet "his bread and butter at the last." And yet when one looks over this famous collection of poems how few of them seem to us at this later date worthy of preservation. How weary one grows of his Cupids and Chloes and how truly gross and artificial so many of his poems appear! Their only redeeming quality lies, it would seem, in a certain airy amorousness

which sometimes, but by no means always, carries with it a happy distinctive tone derived, we may perhaps be justified in surmising, from those wanton digressions in his private life which were to be afterwards so deplored by Samuel Johnson. For there can be small doubt that this "ambassador of meane extraction" as Queen Anne used to call him, this "creature" of Dorset's, was extremely addicted to the pursuit of the not altogether intangible delights which come to those who indulge in what the Elizabethans were wont to name as the pastime of "wenching."

Mat Prior was in fact a most incorrigible amorist. He would spend an evening with Oxford, Bolingbroke, Pope, and Swift and then go off gay and incontinent to this or that little midnight drab.

"Fair Thames she haunts, and every neighbouring
grove
Sacred to soft recess, and gentle love."

"So when I am wearied with wandering all day
To thee, my delight, in the evening I come:
No matter what beauties I saw in my way;
They were but my visits, but thou art my home."

However much one may regret in his poems the presence of a certain note of hard artificial and insensitive cynicism, one cannot but accede that he is able in his own facile way better almost than any other English poet to indicate the unwisdom of putting too high a value upon the ungenerous temptation of inordinate chastity. The iniquity of thus capriciously damming up one of the main streams of human happiness seems to have lodged it-

self very firmly in this Dorset man's brain. And he was at pains to whisper his perilous convictions into the pretty conch-like ears of every young girl he had to do with.

"Never fancy time's before you,
Youth, believe me, will away;
Then alas! who will adore you
Or to wrinkles tribute pay.

All the swains on you attending
Show how much your charms deserve;
But, miser-like, for fear of spending,
You amidst your plenty starve.

While a thousand freer lasses,
Who their youth and charms employ,
Though your beauty theirs surpasses,
Live in far more perfect Joy."

* His frolic philosophy shows scant respect even towards the state of Holy Matrimony. It would seem that his profligate mind could find an excuse to justify the most reprehensible indulgence. His reasoning on this head cannot but be painful reading for married ears! What home would be safe if punishment were made to fit the crime at this rate?

"Since we your husband daily see
So jealous out of season
Phyllis, let you and I agree
To make him so with reason."

But it would be a mistake to think that Matthew Prior was altogether incapable of writing in a more moral vein. His book of poems ends with the epitaph he composed for the tomb of Sir Thomas Powys.

"Here lies Sir Thomas Powys Knight. . . .

What by example he taught throughout his life
At his death he recommended to his family and
friends:

"To fear God, and live uprightly"
Let who ever reads this stone
Be wise, and be instructed."

It is, however, unlikely that the author of the inscription, gave, if the truth were known, very much attention to this death bed exhortation, any more, with shame be it spoken, than does up to the present time the author of this Essay—the humblest and least punctilious of the large and graceless brood which owes its existence to the pious and potent loins of the Knight of Lilford Hall.

"To the grave with the dead
And the living to the bread."

With the money he derived from his book and with the gift of the house in Essex that he had from Lord Oxford, Matthew Prior proposed to spend the last years of his life happily enough. He had grown a little deaf for no other reason, as he explained, than that "he had not thought of taking care of his ears, while not sure of his head." But apparently this slight physical handicap in no way interfered with his relish for life. We hear of him planting quincunxes in the garden of his manor, or spending long happy months at Wimple, Oxford's country seat, delighted as much by the grace of the little Lady Margaret as he had before been by the manners "wild as colt untam'd" of the high-spirited Kitty,

afterward to become the famous Duchess of Queensbury whom Beau Nash is said to have treated so roughly and who living to the latter end of the eighteenth century died, at last, characteristically enough, from a surfeit of cherries!

It was at Wimple that Matthew Prior himself ended his life on September 18, 1721. His will was found to contain a legacy to a woman whom Dr. Johnson does not hesitate to describe as "a despicable drab of the lowest species."

In a letter written at the time we read:

"I find poor Prior's will makes noise in town much to his disadvantage. Some malicious fellows have had the curiosity to go and inquire of the ale-house woman what sort of conversation Prior had with her. The ungrateful strumpet is very free of telling it and gives such accounts as affords much diversion."

Also from Arbuthnot we get a suggestive glimpse of this side of the poet's life, which was, after all, so singularly removed from the stately quincunxes, round which on August evenings "My noble, lovely little Peggy" was wont to play and trip it. "We are to have a bowl of punch at Bessy Cox's. She would fain have put it upon Lewis that she was his Emma; she owned Flanders Jane was his Chloe."

Matthew Prior had long had Westminster Abbey "in his eye" and in the end he indulged "a last piece of human vanity" by bequeathing five hundred pounds towards the erection of

the preposterous monument which now stands above his grave.

The actual place of his burial is at the feet of Edmund Spenser in the poet's corner.

It must be confessed there appears something curiously incongruous about a trick of fortune which could cause the wanton paramour of Mistress Besse Cox to lie down in the dust, head to heel, with none other than the fastidious author of the *Faerie Queene*.

WILLIAM COWPER

I fled Him, down the nights and down the days;
I fled Him, down the arches of the years;
I fled Him, down the labyrinthine ways
Of my own mind.

It is not for nothing that William Cowper is so often associated in our memory with the particular animal which delighted him more than any other. From the day of his birth to the day of his death his plight was curiously similar to that of a hunted hare. In his case, however, the flight, the desperate agony, the tragic climax, was by no means contained in the brief hours of a mud-splashed January afternoon, for it was the awful destiny of this sensitive and polished gentleman, of this elegant partial hermaphrodite, to hear for no less than sixty-nine years, unmistakably upon the midnight wind, the sound of "The Hound of Heaven" following close at his heels.

He heard it as a schoolboy crossing the churchyard of St. Margaret's; he heard it in his chambers at the Inner Temple above "the sound of waters passing only into pails and pitchers"; he heard it in the sweet seclusion of Olney "upon the southern side of the slant hills" and louder and even louder he heard it during the last terrible years of exile in East Anglia.

William Cowper was born at Great Berkamstead in Hertfordshire on Nov. 26, 1731. His father was the rector of the village and also chaplain to George II. His mother, whose maiden

name had been Donne, belonged to the same family as the famous Dean of St. Paul's. While still but a child Cowper was sent to a boarding school, where he fell under the evil persecution of an older boy. So deeply did the personality of this bully impress itself upon the nerves of the young poet that he never dared to look at him above the knees, and, as he himself tells us, "knew him by his shoe buckles better than by anything else." From this school he went to Westminster. Was it, one wonders, some half-conscious premonition of the terrible fate that the future had in store for him which as a boy led him to pay a visit to Bedlam, whose ghastly chamber in those days stood open for the morbid curiosity of the public? The good Hanoverian chaplain appears to have entertained no suspicion of the nature of his son's temperament, for we learn that he at this time gravely put into his hands a treatise on suicide for the purpose of receiving the opinion of his eldest son on that academic question.

Only a few years were to intervene before William Cowper, whatever his judgment may have been upon the philosophical aspects of this problem, was to make a serious attempt to put the precepts of the dissertation into practical use. Terrified beyond reason by certain contingencies which might require him to appear in public, he deliberately tried to kill himself by means of his garters and his chamber door.

Day and night I was upon the rack, lying down in horror and rising up in despair.

It was his first attack of actual madness, and he was taken to an asylum. Obsessed by the delusion that he was damned, he remained in this place for two years. His brother, John Cowper, came to visit him, but his sympathetic reasoning got for its pains only one answer: "O brother, I am damned- Think of eternity and then think what it is to be damned!"

On being released from confinement he went to live near Cambridge, and it was during this time that he attached himself to the household of a retired clergyman called Unwin. Shortly after this the good man, his host, was thrown from his horse and killed, and the haunted poet for the rest of his life continued to live under the same roof with the widow, Mary Unwin.

Under the influence of the Rev. John Newton, that "old African blasphemer," as he loved to call himself, the family moved to Olney. There can be no doubt that close proximity to this converted ex-slave trader did William Cowper little good. They saw a great deal of each other. They attended prayer meetings, visited the sick, and collaborated in composing the Olney hymns. And what hymns those of William Cowper are! Some of them as liquid and beautiful as the songs heard from the lips of a shepherd boy in a shadowy fern-grown glade of the delectable mountains:

Hark, my soul! It is the Lord;
'Tis thy Saviour, hear His word;

and others, alas! marred by the primordial savageries of a crude and debased theology:

There is a fountain filled with blood
Drawn from Emmanuel's veins;
And sinners, plunged beneath that flood,
Lose all their guilty stains.

John Newton had already earned a reputation for "preaching people mad!" And indeed it would seem that such achievements filled him with no slight complacence. "Near a dozen gracious people," he tells us, "became disordered in their heads" after listening to his winged words. With such a man at his elbow, what chance, we may well ask, had William Cowper? In the year 1773 he was once more insane, and from then till the day of his death nothing was able to remove his fixed conviction that he had been utterly and finally abandoned by God to the irrevocable doom of eternal perdition.

Damned below Judas, more abhorred than he was,
Who for a few pence sold his holy Master!

So deep-set had this terrible delusion now become that he even denied himself the solace of prayer, deeming that to one in his extreme case it was useless, nay, blasphemous, to attend church or even so much as to say a grace over his daily bread.

And so we come to that long period of Cowper's life which is so familiar to the literary world—the period when the strange, obsessed poet diverted himself "under the point of a sword suspended by a hair" by composing those verses which have made his name famous. Everything was done that could be done to draw his attention away from his sombre, spiritual preoccupations. His friends presented him with tame hares and he spent

his hours in building hutches for these long-eared sensitive creatures, which in the evenings would gambol on the parlor carpet. But even as he watched them at their playful antics he would hear that pursuant voice, "Cowper, you are damned! Cowper, you are damned!" He walked abroad, he chatted, he laughed, he helped to wind Mary Unwin's balls of thread; during the warmer months he would spend long hours in a summer-house, "not much bigger than a sedan chair," and on mild Winter afternoons would take shelter in a greenhouse, the glass of which was covered with mats. But go where he might, hide where he might, those sensitive ears under the quaint cambric muslin cap were aware of sounds by no means easily to be confused with the murmur of bees in mignonette or the chirruping of birds in leafy trees.

There is in truth something almost ghastly in contemplating the spectacle of William Cowper playing spillikins or battledore and shuttlecock with Lady Austin in the face of such preoccupations. It is to Lady Austin, of course, that we owe some of his finest verse, and his talent for poetry at its best is a very high quality. In these long, rambling productions wherein, as Mr. Robert Lynd has so admirably said, Cowper's music progresses "as a snail of imagination laboring under a heavy shell of eloquence," one comes upon passages in which the poet in a manner quite peculiar to himself makes immortal certain scenes of nature. All that he looked upon in his afternoon walks by the side of Mrs. Unwin, all that he noticed as he drove abroad in Lady Has-

keth's carriage, found its place sooner or later in his poetry. And so close was his observation, and so genuine his power of appreciation, that something of the thrill that came to him upon those far-off excursions is still conveyed to us. Many of his country vignettes have in them the burden out of which unique and authentic poetry is made. With what consummate skill he can make us see those country roads about Olney, which to him had become so familiar! The very farm wains he etches in:

and he that stalks

In ponderous boots beside his reeking team.

How by a few inimitable touches he can conjure up before our eyes the look of the Winter landscape, made strange by the first fall of snow, with its few single dead grasses or "bents" still showing above the white surface and indeed made "conspicuous" now by being "fledged with icy feathers."

The cattle mourn in corners where the fence Screens them, and seem half-petrified to sleep In unrecumbent sadness.

We follow his steps up a long arched avenue and share his pleasure in watching the quick movements of a Winter robin—

Pleased with his solitude, and flitting light
From spray to spray, wher'er he rests he shakes
From many a twig the pendant drops of ice
That tinkle in the withered leaves below.

The reappearance of his cousin, Lady Hasketh, into his life was undoubtedly of the greatest advantage to Cowper. This excellent woman did all that was in her power to en-

liven the poet's days. She persuaded the singular household to move from Olney to Weston Underwood and encouraged its two inmates to enjoy such harmless pleasures as were provided by the society of the neighborhood. William Cowper had inherited from his forefathers the manners and easy grace of a well-bred gentleman, and now that fame had come to him his cousin was evidently anxious that he should cut something of a figure in Olney. Commenting upon his clothes at this time, the poet says: "Green and buff are colors in which I am oftener seen than any others, and are become almost as natural to me as to a parrot." The Rev. John Newton was not a little put out by this sudden change in his friend's manner of life. "I find," he wrote, "after all my supposed acquaintance with the human heart there are windings and depths in it of which I know no more than of the dark, unfathomable caves of the ocean," and he never penned a truer word. One feels in entire sympathy with the good sense of Lady Hasketh when she declared, in explanation of her cousin's sadness, "The eternal praying and preaching were too much." As a matter of fact, the Rev. John Newton need have felt no misgiving. Cowper remained still the helpless quarry of the Hound of Heaven, though he disguised himself never so cleverly by "associating with gay people, wearing a green coat and becoming an archer."

In 1787 he tried once more to commit suicide. In superstitious awe he would await the appearance of each new moon and the yearly return of his black month—the month of Jan-

uary. Little enough it availed him to write verses to a dead bullfinch when the following morning he would awake in tremulous apprehension with this line from Milton ringing in his ears:

The wonted roar is up amid the woods.

In 1791 a fresh disaster overtook him. Mrs. Unwin had a paralytic stroke, "Oh, Mr. Cowper, don't let me fall!" came the frightened cry as he stood one morning at his desk in his parlor. The seizure had an unexpected effect upon the behavior of this woman, "more polite than a Duchess." From thenceforth, instead of feeling concern for the comfort of the aging and demented poet, Mary Unwin became more and more exacting in her querulous demands upon his attention. His work, his walks, his diversions had each in turn to be abandoned, until every hour of his day was occupied in looking after her slightest wish and whim.

The strain became too much. Again his hallucinations took audible form. He heard voices. With questionable veracity a stone in the wall called out, "I am God." And once at midnight he listened to this mysterious and baleful utterance, "He shall eat eleven days longer or thereabout."

At last he was persuaded by his kinsman, "Johnny of Norfolk," to leave Weston and travel to East Anglia. John Baily alludes to this drastic change in the poet's life as "a last heroic service rendered to him by his cousin." The wisdom and kindness of the move have always seemed dubious. "Johnny of Norfolk"

happened to be a progenitor of the present writer, and even as a child he remembers noting the strangely unimaginative look of the good man's features as represented in a family portrait. It is incredible to believe that so spruce and bepowdered an individual should have been able to understand the difficult and delicate nature of the obligations he was undertaking. There is evidence that the ailing poet resented the change. A few days before he left he wrote on a window shutter of his home the following words:

Farewell, dear scenes, forever closed to me;
Oh, for what sorrows must I now exchange ye?

Once in Norfolk, under the care of his energetic kinsman, things went from bad to worse. The few remaining letters penned by Cowper hit one to the heart. He recognized in the wayside grass of the Norfolk lanes the same herbs that he had so often gathered for his pet birds and is reminded of that long interim of years when he was at least *half-happy*. He writes to Lady Hesketh:

Oh, that there could be pity, or if not that, at least forbearance, for the most forlorn of all men! Such I am, and expect to be in a condition worse than such tomorrow. Farewell—W. C.

Mrs. Unwin was slowly dying and the poet knew it. "Sally, is there life above-stairs?" he asked the maidservant on the morning before the end came. When told of her death he persisted in declaring that she was not "actually dead," but it was easy enough to dislodge any delusion upon that score by simply showing him the face of the woman who had been his constant companion for so many years.

With one shrill, wild cry the nightcapped hermaphrodite turned from the bedside, never to mention her name again.

Slowly the years passed, with William Cowper sitting "still and silent as a stone." Terrible indeed must have been the thoughts that passed through that diseased brain! Once more he heard voices; and to counteract their influence "Johnny of Norfolk," a man of infinite resource, had tubes let into that silent chamber, little tin tubes, through which he caused to have piped words of comfort in attempted emulation of the awful voice of God!

The end approached. They asked him how he felt. "I feel," answered William Cowper, "unutterable despair." On his deathbed they brought him a cordial, but he waved it aside. "What can it signify?"

It is satisfactory to learn that in the opinion of my great-grandfather, when at length at liberty to scrutinize the corpse, there rested upon the dead poet's face an expression of "holy surprise."

Cowper was buried at East Dereham. A month before his death for one short interval his poetic genius returned to him and taking pen in hand he wrote "The Castaway." Even to this day the terrible and tragic lines of this tremendous poem trouble our imaginations. What a cry is here! What an appalling cry!

No voice divine the storm allayed,
No light propitious shone,
When, snatched from all effectual aid,
We perished, each alone;
But I beneath a rougher sea
And whelmed in deeper gulfs than he.

JAMES THOMSON

The attitude of forlorn despair which finds perpetual recurrence in the minds of certain types of human beings when they come to look beneath the surface of existence, has never, perhaps, been given more complete and final expression than in the poetry of James Thomson. There remains indeed nothing further to be said, for this unfortunate man has found it in him to curse the womb that bare him and the paps which he has sucked and to outface God and go down into the pit at last with his terrible avowals still unretracted.

James Thomson was born in 1834, of Scots parentage. His father was a sea-captain, and a man apparently as capable of holding his own against the storms of the Atlantic as was his son against those other more terrible gales that beat in upon him from eternity. For six days, we are told, the master of the good ship "Eliza Stewart" never left the bridge; stood there, in fact, until carried below broken and paralyzed; and up to the very last year of his tragic life his son may be said to have remained at his post with no less resolution.

James Thomson was trained to be an army school master. At the age of eighteen, while quartered at Ballincollig, in Cork, he fell in love with a young girl named Matilda Wella. After he had known her for two years she died; a calamity of which the full and bitter consciousness remained with Thomson for a

quarter of a century. There is scarcely one of his poems that has not some allusion to this child, and in the end, when the awful history of his days was at last concluded, a lock of her hair was buried with him.

In Ireland, he also met Charles Bradlaugh who, having already got into trouble for his free-thinking views, had enlisted as a common trooper. When Bradlaugh was on sentry duty it was Thomson's custom to walk by his side, and one gets an interesting picture of these two men who were destined to become so famous, discoursing philosophy under the summer stars.

In 1862, Thomson was expelled from the service for a slight breach of military discipline. For the next five years he lived in London in the house of Charles Bradlaugh, earning his livelihood as best he could by office work and journalism. This period was in all probability the happiest of his life. With his friend to satisfy his craving for companionship, and Hypatia and Alice Bradlaugh to satisfy his more sentimental affections, he would seem to have attained to some measure of contentment. In the evenings, he would tell stories to the children or sit smoking with their father, and on Sundays and holidays the whole party would often go out for excursions or perhaps walk together to the grave of Charles Lamb.

It was now that his poems began to appear in the *National Reformer*. Many of them are marred by that same tone of forced jocularity which spoils his letters. Now and again, however, they are excellent, as, for example, the

one entitled "l'Ancien Régime," the bitter, satirical quality of which is altogether characteristic of his temper.

Who has a thing to bring
For a gift to our Lord the King?
A harlot brought him her flesh,
Her lusts, and the manifold mesh
Of her wiles, intervolved with caprice;
Harlotry's just the thing
To bring as a gift for our King.

Thomson made at this time two expeditions out of England, one to America as the secretary to some mining corporation in Colorado, and one to Spain as a correspondent for the *New York World*. The latter enterprise proved a complete failure: sufficient copy was not forthcoming. Soon after his return a quarrel with Bradlaugh threw him once for all upon his own resources and he became for the rest of his life what is known as a "single-room bachelor" in the East End of London.

There were thousands and thousands of human kind
In this desert of brick and stone:
But some were deaf and some were blind,
And he was there alone.

Closed up in one small room, as it were in a cage, he dragged out the rest of his life, day by day.

The publication in 1874, of his masterpiece "The City of Dreadful Night," brought him into contact with several of the more discerning men of letters of the day. George Meredith, Philip Bourke Marston, W. M. Rossetti, Emerson and Longfellow all recognized its value. He sent copies of it to Thomas Carlyle and George Eliot, no comment, however, being

evoked from the former old curmudgeon, though the ethical-minded novelist was considerate enough to write a letter to him in which she expressed the hope "that a mind informed with so much passionate energy would soon produce works with a wide embrace of human fellowship in them."

Slowly the dull years passed by with penury, disappointment and insomnia as his three constant companions. At certain periods he would endeavour to drown in alcohol the misery of his weary and jaded mind, but it was only to return to his sordid surroundings, after the bout was over, in a fit of even greater depression. That people could ever think of time as passing swiftly was to James Thomson incomprehensible—

This Time which crawleth like a monstrous snake
Wounded and slow and very venomous;

From his diaries we get a devastating insight into the dreariness of his life, into the agony that too often, alas! in this world besets an imaginative and sensitive nature submerged in commonplace surroundings. Day followed day in uneventful melancholy procession, and each was as like to each in its neutral tone as one dull English penny is to another. From his walks along the depressing streets of London, he would return to his lodging house, would open the dreary house-door and, passing through the tiny hall, smelling of today's cooking, yesterday's gas, and innumerable forgotten inmates, stumble up the dark stairway to be confronted at last by the same books, the same dirty and hateful litter that he had left so

short a time before. It is no wonder that references to the weather play so important a part in these journals, references to the visibility or invisibility of sun or moon, those two free luminaries that moved above his head with so large and tranquil an assurance.

Bitter easterly. Some sun. Aftn. walk about Soho. (bought coal-scuttle; after three years!) Moon keen as crystal, sky pale and cloudless, stars few and dim, ground like iron, wind like a razor.

. . . Cold slight snow; fine morning, livid day. Snowing pretty heavily at night (9 p. m.). Picked just twenty-one sticks out of my grate, the rest being quite enough to light the fire.

Nov. 2nd, 1874. Forty years old to-day. Cold; third day of fog. Congenial natal weather.

It was at this time that James Thomson wrote that curious poem called "In the Room."

The afternoon has grown late and still the curtains of the apartment remain undrawn,

And nimble mice slept, wearied out
With such a double night's uproar;

At last in the silent dimness the very furniture becomes articulate! The mirror, the cupboard and finally the bed, speak!

I know when men are good or bad,
When well or ill, he slowly said;
When sad or glad, when sane or mad,
And when they sleep alive or dead.

The bed went on, 'This man who lies
Upon me now is stark and cold;
He will not any more arise,
And do the things he did of old.'

But envisage his release as he might in imaginative verse, James Thomson's life still dragged on, dragged on, with all the horrible tenacity of some wretched animal whose spine

is broken and yet does not die. His insomnia grew worse, but still he survived,

Feeling the hands of the Infernal Powers
Heavy upon me for enormous ill.

In his ghastly poem to insomnia he describes with intolerable vividness, the nerve-tortured state of one to whose brain even the solace of sleep is denied; as if he alone, James Thomson, ex-army schoolmaster, had been selected by some incredible and malign causality to bear the burden of an immortal consciousness when all other men had rest.

I heard the sounding of the midnight hour;
The others one by one had left the room,
In certain assurance that the gracious power
Of sleep's fine alchemy would bless the gloom.

But I with infinite weariness outworn,
Haggard with endless nights unblessed by sleep,
Ravaged by thoughts unutterably forlorn,
Plunged in despairs unfathomably deep,
Went cold and pale and trembling with affright
Into the desert vastitude of Night
Arid and wild and black.

How I got through I know not, faint as death;
And then I had to climb the awful scarp,

Perspiring with faint chills instead of heat,
Trembling, and bleeding hands and knees and feet;
Falling, to rise anew;
Until, with lamentable toil and travel
Upon the ridge of arid sand and gravel
I lay supine half-dead and heard the bells chime
two.

Towards the end of his life he was occupied in writing certain literary essays, selecting, curiously enough, amongst other writers no less a subject than Walt Whitman, whose poetry at

that time was little known in England. There is something extremely affecting in this appreciation of the great American avoucher written by the hand of the man who of all others was the most unhappy. Might it really have been possible, had the two ever met, that the great, life-giving, life-accepting heart of Walt Whitman would have had vigour enough in its ample aplomb to fortify and sustain the darkened spirit of the London poet? At any rate, one experiences a strange sensation, as of miraculous help arriving suddenly in a situation of desperate need, when one comes upon a quotation of this kind in an article by Thomson:

Let the physicians and priest go home
I seize the descending man, and raise him with
 resistless will.
O despairer, here is my neck:
By God! you shall not go down! Hang your whole
 weight upon me.
I drape you with tremendous breath—I buoy you
 up;
Every room of the house I fill with armed force,
Lovers of me; bafflers of the graves.

It would be a mistake, however, to regard Thomson as a spiritual weakling. He was not that. Rather, like Dante's proud Italian, damned for ever in the blackest abyss of Hell, he raises his hand in blasphemous imprecation against Almighty God. "Take it, God, for it is at thee that I aim it."

"The City of Dreadful Night" contains passages of extraordinary and appalling power. But, as James Thomson himself declared, its appeal is likely always to be limited.

If any care for the weak words here written,
It must be some one desolate, Fate-smitten,
Whose faith and hope are dead, and who would die.

The conception of the poem, with its sombre imagery, is terrific. The world in which we live is likened to a vast, doomed city which lifts its "mass enorm" in the centre of an arid desert. The city is enveloped in a dim penumbra through the nebulous light of which street-lights burn obscurely. "Amidst the sounding solitudes," "ranged mansions" overshadow everything, "still as tombs" where

Myriads of habitants are ever sleeping,
Or dead, or fled from nameless pestilence!

Along the darkened sidewalks of this tremendous and awful metropolis, James Thomson makes his way, following close upon another figure "because he seemed to walk with an intent."

As I came through the desert, thus it was,
As I came through the desert.

How the reiteration of those famous lines beats in upon the brain after a while, like the regular treading, appalling in its heavy monotony, of hostile feet on a pavement outside one's door:

As I came through the desert, thus it was
As I came through the desert . . .
But I strode on austere;
No hope could have no fear.

In the resonant alleys along which they go
they see

worn faces that look deaf and blind
Like tragic masks of stone. With weary tread,
Each wrapt in his own doom, they wander, wander,
Or sit foredone and desolately ponder
Through sleepless hours with heavy drooping head.

They glimpse a thousand evil things ominous
and dreadful.

After a hundred steps I grew aware
Of something crawling in a lane below;
It seemed a wounded creature prostrate there
That sobbed with pangs in making progress slow,
The hind limbs stretched to push, the fore limbs
then
To drag.

The thing looked up, and behold it was a
man:

Long grey unreverenced locks befouled with mire.
A haggard filthy face with bloodshot eyes,
An infamy for manhood to behold.

At last they draw near to a vast cathedral
whose portentous sculptured mass, shadowed
far up in the cold, limitless darkness of the
night, overlooks a moonlit, cloistral lawn
across the wide expanse of which dim crowds
of wavering phantom citizens are hurrying.
The two travellers enter with the throng, and
there in the vast, hollow, many-aisled sanctu-
ary, with tinted moonbeams slanting down
through the high mullioned windows, they
await the Preacher. Suddenly a voice goes
echoing through the vaulted tracery.

And I have searched the heights and depth, the
scope

Of all our Universe, with desperate hope
To find some solace for your wild unrest.
And now at last authentic word I bring,
Witnessed by every dead and living thing;
Good tidings of great joy for you, for all:
There is no God; no Fiend with names divine
Made us and tortures us; if we must pine,
It is to satiate no Being's gall.

I find no hint throughout the Universe
Of good or ill, of blessings or of curse;
I find alone Necessity Supreme;

With infinite Mystery, abysmal dark,
Unlighted ever by the faintest spark
For us the flitting shadows of a dream.

The world rolls round for ever like a mill;
It grinds out death and life and good and ill
It has no purpose, heart or mind or will.

This little life is all we must endure,
The grave's most holy peace is ever sure,
We fall asleep and never wake again.

As the years passed, James Thomson's melancholy grew deeper and deeper. Dejected, poverty-stricken, unrecognized, he still tramped the streets, and still from his bed in his lodging house stared blankly into an ultimate void. In the beginning of the year 1882, something seems to have given way in him at last and, fully cognizant of what he was doing, he deliberately set about to drink himself to death. He was thrown out into the streets by his landlord. Again and again with a strange dogged determination he tried to force his way into the miserable abode which, after all, was the only home he knew. "I must have a roof over my head."

Four months passed by and he was still alive. It is known that he spent some part of the time in jail; for the rest, he drifted about in the purlieus of Wapping-Old-Stairs and The Isle of Dogs. Most of his friends lost sight of him. A few of them saw him at rare intervals, and always from his finely moulded head, furrowed now with deep lines, his blue eyes looked out with abject defiance. On one occasion he was seen in a tavern, dressed in mud-stained, ragged clothes. He was wearing a pair of carpet slippers, through the broken

soles of which his naked feet were clearly visible.

Then suddenly he appeared in the rooms of Philip Bourke Marston, the blind poet. Although Marston could not see his guest there was something about his wild speech that filled the blind man with terrible misgivings. Fortunately, William Sharp, the critic, happened to come in later in the afternoon. He found Thomson lying on Marston's bed, in a pool of blood, almost unconscious. He had the sick man conveyed to the London University Hospital where, it is said, he lay for a long time on the bare bench of the common waiting-room until the house physician found time to attend to him. What, exactly, were Thomson's last words has never been divulged. It has been hinted that they were such as to cause even his friends to look askance. "I shall get out of here on Monday, even if it's in my coffin" was one sentence shrieked out by the frenzied man who could not die. His words proved happily true. On the following Monday he, the atheist, theophobist, life hater, found rest at last for his "homeless mind," in a good hour, under six feet of honest earth. No religious service was said over his grave. Free at length from

Infections of unutterable sadness,
Infections of incalculable madness,
Infections of incurable despair,

he was simply put under ground, "unhouseled, unanneal'd," cursed alike by man and God, a renegade and outcast who had been denied everything in the world except genius.

PADRAIC COLUM

It has been given to few writers of verse to express the mood of the land of their birth with an accent as autochthonous as that of Mr. Padraic Colum. It is not for nothing that this shy and delicate poet derives his family name from the most Irish of Irish saints and singers who himself most wonderfully, more than a thousand years ago, struck the very same note that delights us today in Mr. Colum's poetry. For as the holy Columcille looked back from his small craft of skins and branches at the green fields of Ireland growing more and more indistinct behind him, it is said that the sound of his singing was heard far and wide over the cold, drab-coloured waves of the northern sea:

How swift is the speed of my coracle;
Its stem towards Derry.
I grieve at my errand o'er the noble sea
Traveling to Alba of the Ravens.
A grey eye looks back to Erin
A grey eye full of tears.

It is just this same quality, so heightened, so imaginative and yet so convincingly realistic "with its turn for style, its turn for melancholy, and its turn for natural magic," that we find in Padraic Colum's verse. For all the bewildering effrontery displayed by certain Celtic adventurers in the realm of Saxon literature, for all the dash and intellectual brilliance, for instance, of men like Burke, Sheridan, Moore, Wilde, and Shaw, it is not to them that we look

for the true articulate expression of the sad soul of Ireland. We must turn to the ancient Catholic singers, to the country ballad-makers, to the vague, wistful, half-expressed romanticism of poets like Francis Mahony, James Clarence Mangan, W. B. Yeats, J. M. Synge and Padraic Colum, if we are to catch the wild, doleful music which the wandering west winds of the Atlantic awaken in the whin bushes and lone moorland trees of the dedicated and tragic Island.

Mr. Colum was born and brought up in one of the middle counties, and his spirit has been permeated with the very thrill of this articulation. His imagination is the imagination of the incorrigible and wilful people who have retained throughout history so strange an attitude to the bleak illusions which occupy, in so rigid a manner, the attention and interests of the rest of the world.

From the earliest times, the Irish have been irresistibly attracted by those half-uttered secrets of the earth's margins which a chance phrase or unexpected word in Celtic literature seems often so nearly to reveal. Above everything these "amorous Gaedhils" are impressionable to what *can not be spoken*; to the inconstant, tremulous, spiritual messages that come to us with retrospection; to the indefinable, provocative calls, sad voices from lost worlds, as it were, that are brought to us each year with the passing of the seasons; to the incoherent evocations that emanate from certain localities or objects whose forlorn identity when once observed can never be forgotten.

It is indeed fitting enough that Padraic Colum should have called the one slim, precious volume he has given us "Wild Earth." No more adequate title could possibly have been selected. Wild Earth!—in these poems one finds the dew of a thousand early mornings, drawn forth by the yellow sun from our wanton planet which after a million dancing æons remains to this day proud, and hard, and "wild," and never entirely "broken for corn."

Everything Mr. Colum writes has its peculiar interest. In a single illuminating sentence he has done much to elucidate the mysterious power of the most perplexing work of genius that has appeared in modern times. Of "Ulysses" he says: "James Joyce does not write savagely, he writes satanically, and his satire touches not individuals and institutions but life itself." Again and again in Padraic Colum's plays one comes upon passages which bear the stamp of his sensitive and fastidious genius. Take this quotation:

The people have to watch
The black rain and it falling all the day.

And again,

God's will is set
Against us all; it is against
The cattle in the field, and it was they
Stood by his crib; they're moaning always now
He has forgotten them.

In the mere use of the simple words "black rain," what a fresh, unsophisticated approach to the manifestations of the visible world is revealed; and in the second quotation what a winnowed, sensitive delicacy, so Celtic, so

Catholic, is suggested by the "long long thoughts" which could conceive of a deity being laid under some kind of magnanimous obligation to the beasts of the field for no other reason, forsooth, than that they had been the mute spectators of the birth of a god! It is, indeed, this "fresh approach" which gives to Mr. Colum's books written for children the clear, lucid tone which makes each of them, in its way, a perfect work of art. They seem always to be the narrations of one who has experienced something or seen something for the first time. In truth, to the eye of a poet, what matter that a thousand ages have passed since the world's crust first cooled? Are not men, birds, animals, and flowers, created every hour, incredible and exultant, from the mysterious, fecund breathing of the nostrils of God?

How evasively and unpretentiously Padraic Colum conveys to us the poetry of life; lines, and even single words of his, brushing against our intelligence with the surprise and softness of a linnet's wings. What a rich harvest of impressions his poet's nature must have gathered in those days of his youth—the homely, simple look of white geese against a peat stack, the cottage interior with its shrine and corn bin, the "lonesome hush" of a deserted country road, "the fire-seed sleeping deep in white ashes"!

But valuable though his other contributions to literature are, it is to his poetry that one returns, time and again, when one wishes for the particular refreshment that in certain moods he alone can give us. Has he, one won-

ders, in his poem entitled "The Poet" presented us with a valuable clue by which to explain his power?

'The blackbird's nest, in the briar,
The sea-gulls' nests on the ground
They are nests, and they're more than nests' he
said

'They are tokens I have found.'

'But close to the ground are they reared
The wings that take widest way,
And the birds that sing best in the wood,' he said,
'Are bred with their breasts to the clay.'

The poems of "Wild Earth" do in very fact remind one of the direct appeal of the familiar European blackbird with its liquid, flute-like song; but they also have in them something else, something unutterable, unaccountable, melancholy, which one might well associate with a different bird. Continually, as we read, we are startled by a note plaintive and intractable as the whistle of a curlew coming to us on the wind, in fitful intervals, from some far-off, desolate moorland.

The crows still fly to that wood, and out of the
wood she comes
Carrying her load of sticks, a little less now than
before,
Her strength being less; she bends as the hoar rush
bends in the wind.

And then, between daybreak and dark,
And between the hill and the sea,
Three Women, come down from the Mountain,
Will raise the Keen over me.

Och! but I'm weary of mist and dark,
And roads where there's never a house nor bush,
And tired I am of bog and road,
And the crying wind and the lonesome hush!

Hidden away in many of his poems side by side with this haunting feeling of bane, one comes upon an extraordinary suggestion of those unexplained emotions which for want of a better word we call romantic. Perhaps what I mean will also best be illustrated by quoting from certain poems.

To Meath of the pastures,
From wet hills by the sea,
Through Leitrim and Longford,
Go my cattle and me.

I hear in the darkness
Their slipping and breathing—
I name them the bye-ways
They're to pass without heeding ;

Then the wet, winding roads,
Brown bogs with black water ;
And my thoughts on white ships
And the King o' Spain's daughter.

We hear it again in

Mavourneen is going
From me and from you,
Where Mary will fold him
With mantle of blue!

From reek of the smoke
And cold of the floor,
And the peering of things
Across the half-door.

Or in,

She'll hear my boat on the shingles,
And she'll hear my step on the land,
And the corncrake hid in the meadow
Will tell her I'm at hand!

But it may very well be that in its ultimate essence what constitutes the chief value of Padraic Colum's work is the faculty he pos-

sesses for calling up before our eyes the peculiar characteristics of the native Irish, characteristics so simple and yet so imaginative, lingering on even yet, in the more out of the way districts of their country-side. In his writings we hear once more the exact intonation of the fiddlers and the wavering voices of the harp-players who for generations have gone wailing through each white washed hovel, and whose wandering footprints have been mingled for centuries with the webbed indentures of ganders and ducks which mark each muddy bohoreen. Again and yet again we catch the echoes of their doleful exclamations, Och! Ochone! or hear the reiterate murmur of their ranns and quaint benedictions.

I save the seed of fire to-night,
Even so may Christ save me,

On the top of the house let Mary
In the middle let Bridget be.

These are the people whose hearts for so many centuries have been entrammelled with a perilous love for their dark Rosaleen with "her holy delicate white hands."

The priests are on the ocean green
They march along the deep.
There's wine from the royal Pope,
Upon the ocean green;

These are the people who "went forth to war, but always fell" and who to this day cherish deep in their hearts a proud contempt for the "creeping Saxon."

Not forgetting Saxon faith
Not forgetting Norman scath
Not forgetting William's word
Not forgetting Cromwell's sword

From Cruckmoylinn to Carricknabauna, from Glen Nefin to Leitrim, they have eaten "the scrape of hog's lard" and looked upon the three **most** desolate things in the world, and yet have retained throughout the worst period of their agony a "deep affection and recollection" for the tragic soul of their country whose memory in retrospect ever haunts their minds.

In the old, old days, upon Innish,
The fields were lucky and bright,

But possibly in one single poem of three verses Padraic Colum has succeeded more than in any other in giving perfect expression to his feeling not only for the romance and beauty that he finds in innocent, homely things but also for the silent glamour of nature in her most entranced and lambent moods. His poem called "Across the Door" is unsurpassed both in form and imaginative suggestiveness. These lines have upon them the simplicity and inevitability which belong only to great poetry.

With what ease our imagination re-creates the poem's setting—the close interior with the candle light making flickering patterns on the smoke-stained rafters, the quick elbow-movements of the fiddlers, and the young, eager girl who, transported by the music and dance, so soon feels on the moonlit threshold with "the dim, wide meadows" about her, a conscious, bewildered awakening to that wild mystery before which all creation trembles and faints. If Mr. Colum had written no other line of poetry except this piece, in my opinion, it would have ensured for him an undisputed place among the immortals:

The fiddles were playing and playing,
The couples were out on the floor;
From converse and dancing he drew me,
And across the door.

Ah! strange were the dim, wide meadows,
And strange was the cloud-strawn sky,
And strange in the meadows the corncrakes,
And they making cry!

The hawthorn bloom was by us,
Around us the breath of the south.
*White hawthorn, strange in the night-time—
His kiss on my mouth!*

A Story of Primitive Love

By Robert W. Chambers

HALDEMAN-JULIUS PUBLICATIONS
GIRARD — : — KANSAS

Printed in the United States of America

They were doing their work very badly. They got the rope around his neck, and tied his wrists with moose-bush withes, but again he fell, sprawling, turning, twisting over the leaves, tearing up everything around him like a trapped panther.

He got the rope away from them; he clung to it with bleeding fists, he set his white teeth in it, until the jute strands relaxed, unravelled, and snapped, gnawed through by his white teeth.

Twice Tully struck him with a gum hook. The dull blows fell on flesh rigid as stone.

Panting, foul with forest mould and rotten leaves, hands and face smeared with blood, he sat up on the ground, glaring at the circle of men around him.

"Shoot him!" gasped Tully, dashing the sweat from his bronzed brow; and Bates, breathing heavily, sat down on a log and dragged a revolver from his rear pocket. The man on the ground watched him; there was froth in the corners of his mouth.

"Git back!" whispered Bates, but his voice and hand trembled. "Kent," he stammered, "won't ye hang?"

The man on the ground glared.

"Ye've got to die, Kent," he urged; "they all say so. Ask Lefty Dyce; ask Carrots.—He's got to swing fur it—ain't he, Tully?—Kent, fur God's sake, swing fur these here gents!"

The man on the ground panted; his bright eyes never moved.

After a moment Tully sprang on him again. There was a flurry of leaves, a crackle, a gasp and a grunt, then the thumping and thrashing of two bodies writhing in the brush. Dyce and Carrots jumped on the prostrate men. Lefty Sawyer caught the rope again, but the jute strands gave way and he stumbled. Tully began to scream, "He's chokin' me!" Dyce staggered out into the open, moaning over a broken wrist.

"Shoot!" shouted Lefty Sawyer, and dragged Tully aside. "Shoot, Jim Bates! Shoot straight, b'God!"

"Git back!" gasped Bates, rising from the fallen log.

The crowd parted right and left; a quick report rang out—another—another. Then from the whirl of smoke a tall form staggered, dealing blows—blows that sounded sharp as the crack of a whip.

"He's off! Shoot straight!" they cried.

There was a gallop of heavy boots in the woods. Bates, faint and dazed, turned his head.

"Shoot!" shrieked Tully.

But Bates was sick; his smoking revolver fell to the ground; his white face and pale eyes contracted. It lasted only a moment; he started after the others, plunging, wallowing through thickets of osier and hemlock underbrush.

Far ahead he heard Kent crashing on like a young moose in November, and he knew he was making for the shore. The others knew too. Already the gray gleam of the sea cut a straight line along the forest edge; already the soft clash of the surf on the rocks broke faintly through the forest silence.

"He's got a canoe there!" bawled Tully. "He'll be into it!"

And he was into it, kneeling in the bow, driving his paddle to the handle. The rising sun gleamed like red lightning on the flashing blade; the canoe shot to the crest of a wave, hung, bows dripping in the wind, dropped into the depths, glided, tipped, rolled, shot up again, staggered, and plunged on.

Tully ran straight out into the cove surf; the water broke against his chest, bare and wet with sweat. Bates sat down on a worn black rock and watched the canoe listlessly.

The canoe dwindled to a speck of gray and silver; and when Carrots, who had run back to the gum camp for a rifle, returned, the speck on the water might have been easier to hit than a loon's head at twilight. So Carrots, being thrifty by nature, fired once, and was satisfied to save the other cartridges. The canoe was still visible, making for the open sea. Somewhere beyond the horizon lay the keys, a string of rocks bare as skulls, black and slimy where the sea cut their base, white on the crests with the excrement of sea birds.

"He's makin' fur the Key to Grief!" whispered Bates to Dyce.

Dyce, moaning, and nursing his broken wrist, turned a sick face out to sea.

The last rock seaward was the Key to Grief, a splintered pinnacle polished by the sea. From the Key to Grief, seaward a day's paddle, if a man dared, lay the long wooded island in the ocean known as Grief on the charts of the bleak coast.

In the history of the coast, two men had made the voyage to the Key to Grief, and from there to the island. One of these was a rum-crazed pelt hunter, who lived to come back; the other was a college youth; they found his battered canoe at sea, and a day later his battered body was flung up in the cove.

So, when Bates whispered to Dyce, and when Dyce called to the others, they knew that the end was not far off for Kent and his canoe; and they turned away into the forest, sullen, but satisfied that Kent would get his dues when the devil got his.

Lefty spoke vaguely of the wages of sin. Carrots, with an eye to thrift, suggested a plan for an equitable division of Kent's property.

When they reached the gun camp they piled Kent's personal effects on a blanket.

Carrots took the inventory: a revolver, two gum hooks, a fur cap, a nickel-plated watch, a pipe, a pack of new cards, a gum sack, forty pounds of spruce gum, and a frying pan.

Carrots shuffled the cards, picked out the joker and flipped it pensively into the fire. Then he dealt cold decks all around.

When the goods and chattels of their late companion had been divided by chance—for there was no chance to cheat—somebody remembered Tully.

"He's down there on the coast, starin' after the canoe," said Bates huskily.

He rose and walked toward a heap on the ground covered by a blanket. He started to lift the blanket, hesitated, and finally turned away. Under the blanket lay Tully's brother, shot the night before by Kent.

"Guess we'd better wait till Tully comes," said Carrots uneasily. Bates and Kent had been campmates. An hour later Tully walked into camp.

He spoke to no one that day. In the morning Bates found him down on the coast digging, and said: "Hello, Tully! Guess we ain't much hell on lynchin'!"

"Naw," said Tully. "Git a spade."

"Goin' to plant him there?"

"Yep."

"Where he kin hear them waves?"

"Yep."

"Purty spot."

"Yep."

"Which way will he face?"

"Where he kin watch fur that damned canoe!" cried Tully fiercely.

"He—he can't see," ventured Bates uneasily. "He's dead, ain't he?"

"He'll heave up that there sand when the canoe comes back! An' it's a-comin'! An' Bud Kent'll be in it, dead or alive! Git a spade!"

The pale light of superstition flickered in Bates's eyes. He hesitated.

"The—the dead can't see," he began; "kin they?"

Tully turned a distorted face toward him.

"Yer lie!" he roared. "My brother kin see, dead or livin'! An' he'll see the hangin' of Bud Kent! An' he'll git up outer the grave fur to see it, Bill Bates! I'm tellin' ye! I'm tellin' ye! Deep as I'll plant him, he'll heave that there sand and call to me, when the canoe comes in! I'll hear him; I'll be here! An' we'll live to see the hangin' of Bud Kent!"

About sundown they planted Tully's brother, face to the sea.

II

On the Key to Grief the green waves rub all day. White at the summit, black at the base, the shafted rocks rear splintered pinnacles, slanting like channel buoys. On the polished pillars sea birds brood—white-winged, bright-eyed sea birds, that nestle and preen and flap and clatter their orange-coloured beaks when the sifted spray drives and drifts across the reef.

As the sun rose, painting crimson streaks criss-cross over the waters, the sea birds sidled together, huddling row on row, steeped in downy drowse.

Where the sun of noon burnished the sea, an opal wave washed, listless, noiseless; a sea bird stretched one listless wing.

And into the silence of the waters a canoe glided, bronzed by the sunlight, jewelled by the salt drops stringing from prow to thwart, seaweed a-trail in the diamond-flashing wake, and in the bow a man dripping with sweat.

Up rose the gulls, sweeping in circles, turning, turning over rock and sea, and their clamour filled the sky, starting little rippling echoes among the rocks.

The canoe grated on a shelf of ebony; the seaweed rocked and washed; the little sea crabs sheered sideways, down, down, into limpid depths of greenest shadows. Such was the coming of Bud Kent to the Key to Grief.

He drew the canoe halfway up the shelf of rock and sat down, breathing heavily, one brown arm across the bow. For an hour he sat there. The sweat dried under his eyes. The sea birds came back, filling the air with soft querulous notes.

There was a livid mark around his neck, a red, raw circle. The salt wind stung it; the sun burned it into his flesh like a collar of red-hot steel. He touched it at times; once he washed it with cold salt water.

Far in the north a curtain of mist hung on the sea, dense, motionless as the fog on the Grand Banks. He never moved his eyes from it; he knew what it was. Behind it lay the Island of Grief.

All the year round the Island of Grief is hidden by the banks of mist, ramparts of dead white fog encircling it on every side. Ships give it wide berth. Some speak of warm springs on the island whose waters flow far out to sea, rising in steam eternally.

The pelt hunter had come back with tales of forests and deer and flowers everywhere; but he had been drinking much, and much was forgiven him.

The body of the college youth tossed up in the cove on the mainland was battered out of recognition, but some said, when found, one hand clutched a crimson blossom half wilted, but broad as a sap pan.

So Kent lay motionless beside his canoe, burned with thirst, every nerve vibrating, thinking all these things. It was not fear that whitened the firm flesh under the tan; it was the fear of fear. He must not think—he must throttle dread; his eyes must never falter, his head never turn from that wall of mist across the sea. With set teeth he crushed back terror; with glittering eyes he looked into the hollow eyes of fright. And so he conquered fear.

He rose. The sea birds whirled up into the sky, pitching, tossing, screaming, till the sharp flapping of their pinions set the snapping echoes flying among the rocks.

Under the canoe's sharp prow the kelp bobbed and dipped and parted; the sunlit waves ran out ahead, glittering, dancing. Splash! splash! bow and stern! And now he knelt again, and the polished paddle swung and dipped, and swept and swung and dipped again.

Far behind, the clamour of the sea birds lingered in his ears, till the mellow dip of the paddle drowned all sound and the sea was a sea of silence.

No wind came to cool the hot sweat on cheek and breast. The sun blazed a path of flame before him, and he followed out into the waste of waters. The still ocean divided under the bows and rippled innocently away on either side, tinkling, foaming, sparkling like the current in a woodland brook. He looked around at the world of flattened water, and the fear of fear rose up and gripped his throat again. Then he lowered his head, like a tortured bull, and shook the fear of fear from his throat, and drove the paddle into the sea as a butcher stabs, to the hilt.

So at last he came to the wall of mist. It was thin at first, thin and cool, but it thickened and grew warmer, and the fear of fear dragged at his head, but he would not look behind.

Into the fog the canoe shot; the gray water ran by, high as the gunwales, oily, silent. Shapes flickered across the bows, pillars of mist that rode the waters, robed in films of tattered shadows. Gigantic forms towered to dizzy heights above him, shaking out shredded shrouds of cloud. The vast draperies of the fog swayed and hung and trembled as he brushed them; the white twilight deepened to a sombre gloom. And now it grew thinner; the fog became a mist, and the mist a haze, and the haze floated away and vanished into the blue of the heavens.

All around lay a sea of pearl and sapphire, lapping, lapping on a silver shoal.

So he came to the Island of Grief.

III

On the silver shoal the waves washed and washed, breaking like crushed opals where the sands sang with the humming froth.

Troops of little shore birds, wading on the shoal, tossed their sun-tipped wings and scuttled inland, where, dappled with shadow from the fringing forest, the white beach of the island stretched.

The water all around was shallow, limpid as crystal, and he saw the ribbed sand shining on the bottom, where purple seaweed floated, and delicate sea creatures darted and swarmed and scattered again at the dip of his paddle.

Like velvet rubbed on velvet the canoe brushed across the sand. He staggered to his feet, stumbled out, dragged the canoe high up under the trees, turned it bottom upward, and sank beside it, face downward in the sand. Sleep came to drive away the fear of fear, but hunger, thirst, and fever fought with sleep, and he dreamed—dreamed of a rope that sawed his neck, of the fight in the woods, and the shots. He dreamed, too, of the camp, of his forty pounds of spruce gum, of Tully, and of Bates. He dreamed of the fire and the smoke-scorched kettle, of the foul odour of musty bedding, of the greasy cards, and of his own new pack, hoarded for weeks to please the others. All this he dreamed, lying there face downward in the sand; but he did not dream of the face of the dead.

The shadows of the leaves moved on his blonde head, crisp with clipped curls. A butterfly flitted around him, alighting now on his legs, now on the back of his bronzed hands. All the afternoon the bees hung droning among the wildwood blossoms; the leaves above scarcely rustled; the shore birds brooded along the water's edge; the thin tide, sleeping on the sand, mirrored the sky.

Twilight paled the zenith; a breeze moved in the deeper woods; a star glimmered, went out, glimmered again, faded, and glimmered.

Night came. A moth darted to and fro under the trees; a beetle hummed around a heap of seaweed and fell scrambling in the sand. Somewhere among the trees a sound had become distinct, the song of a little brook, melodious, interminable. He heard it in his dream; it threaded all his dreams like a needle of silver, and like a needle it pricked him—pricked his dry throat and cracked lips. It could not awake him; the cool night swathed him head and foot.

Toward dawn a bird woke up and piped. Other birds stirred, restless, half awakened; a gull spread a cramped wing on the shore, preened its feathers, scratched its tufted neck, and took two drowsy steps toward the sea.

The sea breeze stirred out behind the mist bank; it raised the feathers on the sleeping gulls; it set the leaves whispering. A twig snapped, broke off, and fell. Kent stirred, sighed, trembled, and awoke.

The first thing he heard was the song of the brook, and he

stumbled straight into the woods. There it lay, a thin, deep stream in the gray morning light, and he stretched himself beside it and laid his cheek in it. A bird drank in the pool, too—a little fluffy bird, bright-eyed and fearless.

His knees were firmer when at last he rose, heedless of the drops that beaded lips and chin. With his knife he dug and scraped at some white roots that hung half meshed in the bank of the brook, and when he had cleaned them in the pool he ate them.

The sun stained the sky when he went down to the canoe; but the eternal curtain of fog, far out at sea, hid it as yet from sight.

He lifted the canoe, bottom upwards, to his head, and, paddle and pole in either hand, carried it into the forest.

After he had set it down he stood a moment, opening and shutting his knife. Then he looked up into the trees. There were birds there, if he could get at them. He looked at the brook. There were prints of his fingers in the sand; there, too, was the print of something else—a deer's pointed hoof.

He had nothing but his knife. He opened it again and looked at it.

That day he dug for clams and ate them raw. He waded out into the shallows, too, and jabbed at fish with his setting pole, but hit nothing except a yellow crab.

Fire was what he wanted. He hacked and chipped at flinty-looking pebbles, and scraped tinder from a stick of sun-dried driftwood. His knuckles bled, but no fire came.

That night he heard deer in the woods, and could not sleep for thinking, until the dawn came up behind the wall of mist, and he rose with it to drink his fill at the brook and tear raw clams with his white teeth. Again he fought for fire, craving it as he had never craved water, but his knuckles bled, and the knife scraped on the flint in vain.

His mind, perhaps, had suffered somewhat. The white beach seemed to rise and fall like a white carpet on a gusty hearth. The birds, too, that ran along the sand, seemed big and juicy, like partridges; and he chased them, hurling shells and bits of driftwood at them till he could scarcely keep his feet for the rising, plunging beach—or carpet, whichever it was. That night the deer aroused him at intervals. He heard them splashing and grunting and crackling along the brook. Once he arose and stole after them, knife in hand, till a false step into the brook awoke him to his folly, and he felt his way back to the canoe trembling.

Morning came, and again he drank at the brook, lying on the sand where countless heartshaped hoofs had passed leaving clean imprints; and again he ripped the raw clams from their shells and swallowed them, whimpering.

All day long the white beach rose and fell and heaved and flattened under his bright dry eyes. He chased the shore birds at times, till the unsteady beach tripped him up and he fell full length in the sand. Then he would rise moaning, and creep into the shadow of the wood, and watch the little song-birds in the branches, moaning, always moaning.

His hands, sticky with blood, hacked steel and flint together, but so feebly that now even the cold sparks no longer came.

He began to fear the advancing night; he dreaded to hear the

big warm deer among the thickets. Fear clutched him suddenly, and he lowered his head and set his teeth and shook fear from his throat again.

Then he started aimlessly into the woods, crowding past bushes, scraping trees, treading on moss and twig and mouldy stump, his bruised hands swinging, always swinging.

The sun set in the mist as he came out of the woods on to another beach—a warm, soft beach, crimsoned by the glow in the evening clouds.

And on the sand at his feet lay a young girl asleep, swathed in the silken garment of her own black hair, round limbed, brown, smooth as the bloom on the tawny beach.

A gull flapped overhead, screaming. Her eyes, deeper than night, unclosed. Then her lips parted in a cry, soft with sleep, "Iho!"

She rose, rubbing her velvet eyes. "Iho!" she cried in wonder; "Inah!"

The gilded sand settled around her little feet. Her cheeks crimsoned.

"E-ho! E-ho!" she whispered, and hid her face in her hair.

IV

The bridge of the stars spans the sky seas; the sun and the moon are the travellers who pass over it. This was also known in the lodges of the Isantee, hundreds of years ago. Chaske told it to Harpam, and when Harpam knew he told it to Hapeda; and so the knowledge spread to Harka, and from Winona to Weharka, up and down, across and ever across, woof and web, until it came to the Island of Grief. And how? God knows!

Weharka, prattling in the tules, may have told Ne-ka; and Ne-ka, high in the November clouds, may have told Kay-oshk, who told it to Shinge-bis, who told it to Skee-skah, who told it to Se-so-Kah.

Iho! Inah! Behold the wonder of it! And this is the fate of all knowledge that comes to the Island of Grief.

.

As the red glow died in the sky, and the sand swam in shadows, the girl parted the silken curtains of her hair and looked at him.

"Eho!" she whispered again in soft delight.

For now it was plain to her that he was the sun! He had crossed the bridge of stars in the blue twilight; he had come!

"E-to!"

She stepped nearer, shivering, faint with the ecstasy of this holy miracle wrought before her.

He was the Sun! His blood streaked the sky at dawn; his blood stained the clouds at even. In his eyes the blue of the sky still lingered, smothering two blue stars; and his body was as white as the breast of the Moon.

She opened both arms, hands timidly stretched, palm upward. Her face was raised to his, her eyes slowly closed; the deep-fringed lids trembled.

Like a young priestess she stood, motionless save for the sudden quiver of a limb, a quick pulse-flutter in the rounded throat. And so she worshipped, naked and unashamed, even after he, reeling, fell heavily forward on his face; even when the evening breeze stealing over the sands stirred the hair on his head, as winds stir the fur of a dead animal in the dust.

.

When the morning sun peered over the wall of mist, and she

saw it was the sun, and she saw him, flung on the sand at her feet, then she knew that he was a man, only a man, pallid as death and smeared with blood.

And yet—miracle of miracles—the divine wonder in her eyes deepened, and her body seemed to swoon, and fall a-trembling, and swoon again.

For, although it was but a man who lay at her feet, it had been easier for her to look upon a god.

He dreamed that he breathed fire—fire, that he craved as he had never craved water. Mad with delirium, he knelt before the flames, rubbing his torn hands, washing them in the crimson-scented flames. He had water, too, cool scented water, that sprayed his burning flesh, that washed in his eyes, his hair, his throat. After that came hunger, a fierce rending agony, that scorched and clutched and tore at his entrails; but that, too, died away, and he dreamed that he had eaten and all his flesh was warm. Then he dreamed that he slept; and when he slept he dreamed no more.

One day he awoke and found her stretched beside him, soft palms tightly closed, smiling, asleep.

V

Now the days began to run more swiftly than the tide along the tawny beach; and the nights, star-dusted and blue, came and vanished and returned, only to exhale at dawn like perfume from a violet.

They counted hours as they counted the golden bubbles, winking with a million eyes along the foam-flecked shore; and the hours ended, and began, and glimmered, iridescent, and ended as bubbles end in a tiny rainbow haze.

There was still fire in the world; it flashed up at her touch and where she chose. A bow strung with the silk of her own hair, an arrow winged like a sea bird and tipped with shell, a line from the silver tendon of a deer, a hook of polished bone—these were the mysteries he learned, and learned them laughing, her silken head bent close to his.

The first night that the bow was wrought and the glossy string attuned, she stole into the moonlit forest to the brook; and there they stood, whispering, listening, and whispering, though neither understood the voice they loved.

In the deeper woods, Kaug, the porcupine, scraped and snuffed. They heard Wabose, the rabbit, pit-a-pat, pit-a-pat, loping across dead leaves in the moonlight. Skee-skah, the woodduck, sailed past, noiseless, gorgeous as a floating blossom.

Out on the ocean's placid silver, Shinge-bis, the diver, shook the scented silence with his idle laughter, till Kay-oshk, the gray gull, stirred in his slumber. There came a sudden ripple in the stream, a mellow splash, a soft sound on the sand.

"Iho! Behold!"

"I see nothing."

The beloved voice was only a wordless melody to her.

"Iho! Ta-hinca, the red deer! E-ho! The buck will follow!"

"Ta-hinca," he repeated, notching the arrow.

"E-to! Ta-mdoka!"

So he drew the arrow to the head, and the gray gull feathers brushed his ear, and the darkness hummed with the harmony of the singing string.

Thus died Ta-mdoka, the buck deer of seven prongs.

VI

As an apple tossed spinning into the air, so spun the world above the hand that tossed it into space.

And one day in early spring, Se-so-Kah, the robin, awoke at dawn, and saw a girl at the foot of the blossoming tree holding a babe cradled in the silken sheets of her hair.

At its feeble cry, Kaug, the porcupine, raised his quilled head. Wabose, the rabbit, sat still with palpitating sides. Kay-oshk, the gray gull, tiptoed along the beach.

Kent knelt with one bronzed arm around them both.

"Tho! Inah!" whispered the girl, and held the babe up in the rosy flames of dawn.

But Kent trembled as he looked, and his eyes filled. On the pale green moss their shadows lay—three shadows. But the shadow of the babe was white as froth.

Because it was the firstborn son, they named it Chaske; and the girl sang as she cradled it there in the silken vestments of her hair; all day long in the sunshine she sang:

Wa-wa, wa-wa, wa-we—yea;
Kah-ween, nee-zheka Ke-diaus-ai,
Ke-gah nau-wai, ne-me-go S'ween,
Ne-baun, ne-baun, ne-daun-is ais.
E-we wa-wa, wa-we—yea;
E-we wa-wa, wa-we—yea.

Out in the calm ocean, Shinge-bis, the diver, listened, preening his satin breast in silence. In the forest, Ta-hinca, the red deer, turned her delicate head to the wind.

That night Kent thought of the dead, for the first time since he had come to the Key of Grief.

"Ake-u! ake-u!" chirped Se-so-Kah, the robin. But the dead never come again.

"Beloved, sit close to us," whispered the girl, watching his troubled eyes. "Ma-cante maseca."

But he looked at the babe and its white shadow on the moss, and he only sighed: "Macante maseca, beloved! Death sits watching us across the sea."

Now for the first time he knew more than the fear of fear; he knew fear. And with fear came grief.

He never before knew that grief lay hidden there in the forest. Now he knew it. Still, that happiness, eternally reborn when two small hands reached up around his neck, when feeble fingers clutched his hand—that happiness that Se-so-Kah understood, chirping to his brooding mate—that Ta-mdoka knew, licking his dappled fawns—that happiness gave him heart to meet grief calmly, in

dreams or in the forest depths, and it helped him to look into the hollow eyes of fear.

He often thought of the camp now; of Bates, his blanket mate; of Dyce, whose wrist he had broken with a blow; of Tully, whose brother he had shot. He even seemed to hear the shot, the sudden report among the hemlocks; again he saw the haze of smoke, he caught a glimpse of a tall form falling through the bushes.

He remembered every minute incident of the trial: Bates's hand laid on his shoulder; Tully, red-bearded and wild-eyed, demanding his death; while Dyce spat and spat and smoked and kicked at the blackened log-ends projecting from the fire. He remembered, too, the verdict, and Tully's terrible laugh; and the new jute rope that they stripped off the market-sealed gum packs.

He thought of these things, sometimes wading out on the shoals, shell-tipped fish spear poised: at such times he would miss his fish. He thought of it sometimes when he knelt by the forest stream listening for Ta-hinca's splash among the cresses: at such moments the feathered shaft whistled far from the mark, and Tamdoka stamped and snorted till even the white fisher, stretched on a rotting log, flattened his whiskers and stole away into the forest's blackest depths.

When the child was a year old, hour for hour notched at sunset and sunrise, it prattled with the birds, and called to Ne-Ka, the wild goose, who called again to the child from the sky: "Northward! northward, beloved!"

When winter came—there is no frost on the Island of Grief—Ne-Ka, the wild goose, passing high in the clouds, called: "Southward! southward, beloved!" And the child answered in a soft whisper of an unknown tongue, till the mother shivered, and covered it with her silken hair.

"O beloved!" said the girl, "Chaske calls to all things living—to Kaug, the porcupine, to Wabose, to Kay-oshk, the gray gull—he calls, and they understand."

Kent bent and looked into her eyes.

"Hush, beloved; it is not that I fear."

"Then what, beloved?"

"His shadow. It is white as surf foam. And at night—I—I have seen——"

"Oh, what?"

"The air about him aglow like a pale rose."

"Ma cante maseca. The earth alone lasts. I speak as one dying—I know, O beloved!"

Her voice died away like a summer wind.

"Beloved!" he cried.

But there before him she was changing; the air grew misty, and her hair wavered like shreds of fog, and her slender form swayed, and faded, and swerved, like the mist above a pond.

In her arms the babe was a figure of mist, rosy, vague as a breath on a mirror.

"The earth alone lasts. Inah! It is the end, O beloved!"

The words came from the mist—a mist as formless as the ether—a mist that drove in and crowded him, that came from the sea, from the clouds, from the earth at his feet. Faint with terror,

he staggered forward calling, "Beloved! And thou, Chaske, O beloved! Ake u! Ake u!"

Far out at sea a rosy star glimmered an instant in the mist and went out.

A sea bird screamed, soaring over the waste of fog-smothered waters. Again he saw the rosy star; it came nearer; its reflection glimmered in the water.

"Chaske!" he cried.

He heard a voice, dull in the choking mist.

"O beloved, I am here!" he called again.

There was a sound on the shoal, a flicker in the fog, the flare of a torch, a face white, livid, terrible—the face of the dead.

He fell upon his knees; he closed his eyes and opened them. Tully stood beside him with a coil of rope.

Iho! Behold the end! The earth alone lasts. The sand, the opal wave on the golden beach, the sea of sapphire, the dusted starlight, the wind, and love, shall die. Death also shall die, and lie on the shores of the skies like the bleached skull there on the Key to Grief, polished, empty, with its teeth embedded in the sand.

THE END

THE MESSENGER
A Ghost Story

I

"The bullet entered here," said Max Fortin, and he placed his middle finger over a smooth hole exactly in the centre of the forehead.

I sat down upon a mound of dry seaweed and unslung my fowling piece.

The little chemist cautiously felt the edges of the shot-hole, first with his middle finger, then with his thumb.

"Let me see the skull again," said I.

Max Fortin picked it up from the sod.

"It's like all the others," he observed. I nodded, without offering to take it from him. After a moment he thoughtfully replaced it upon the grass at my feet.

"It's like all the others," he repeated, wiping his glasses on his handkerchief. "I thought you might care to see one of the skulls, so I brought this over from the gravel pit. The men from Bannalec are digging yet. They ought to stop."

"How many skulls are there altogether?" I inquired.

"They found thirty-eight skulls; there are thirty-nine noted in the list. They lie piled up in the gravel pit on the edge of Le Bihan's wheat field. The men are at work yet. Le Bihan is going to stop them."

"Let's go over," said I; and I picked up my gun and started across the cliffs, Fortin on one side, Mome on the other.

"Who has the list?" I asked, lighting my pipe. "You say there is a list?"

"The list was found rolled up in a brass cylinder," said the little chemist. He added: "You should not smoke here. You know that if a single spark drifted into the wheat——"

"Ah, but I have a cover to my pipe," said I, smiling.

Fortin watched me as I closed the pepperbox arrangement over the glowing bowl of the pipe. Then he continued:

"The list was made out on thick yellow paper; the brass tube has preserved it. It is as fresh to-day as it was in 1760. You shall see it."

"Is that the date?"

"The list is dated 'April, 1760.' The Brigadier Durand has it. It is not written in French."

"Not written in French!" I exclaimed.

"No," replied Fortin solemnly, "it is written in Breton."

"But," I protested, "the Breton language was never written or printed in 1760."

"Except by priests," said the chemist.

"I have heard of but one priest who ever wrote the Breton language," I began.

Fortin stole a glance at my face.

"You mean—the Black Priest?" he asked.

I nodded.

Fortin opened his mouth to speak again, hesitated, and finally shut his teeth obstinately over the wheat stem that he was chewing.

"And the Black Priest?" I suggested encouragingly. But I knew it was useless; for it is easier to move the stars from their courses than to make an obstinate Breton talk. We walked on for a minute or two in silence.

"Where is the Brigadier Durand?" I asked, motioning Mome to come out of the wheat, which he was trampling though it were heather. As I spoke we came in sight of the farther edge of the wheat field and the dark, wet mass of cliffs beyond.

"Durand is down there—you can see him; he stands just behind the Mayor of St. Gildas."

"I see," said I; and we struck straight down, following a sun-baked cattle path across the heather.

When we reached the edge of the wheat field, Le Bihan, the Mayor of St. Gildas, called to me, and I tucked my gun under my arm and skirted the wheat to where he stood.

"Thirty-eight skulls," he said in his thin, high-pitched voice; "there is but one more, and I am opposed to further search. I suppose Fortin told you?"

I shook hands with him, and returned the salute of the Brigadier Durand.

"I am opposed to further search," repeated Le Bihan, nervously picking at the mass of silver buttons which covered the front of his velvet and broadcloth jacket like a breastplate of scale armour.

Durand pursed up his lips, twisted his tremendous mustache, and hooked his thumbs in his sabre belt.

"As for me," he said, "I am in favour of further search."

"Further search for what—for the thirty-ninth skull?" I asked.

Le Bihan nodded. Durand frowned at the sunlit sea, rocking like a bowl of molten gold from the cliffs to the horizon. I followed his eyes. On the dark glistening cliffs, silhouetted against the glare of the sea, sat a cormorant, black, motionless, its horrible head raised toward heaven.

"Where is that list, Durand?" I asked.

The gendarme rummaged in his despatch pouch and produced a brass cylinder about a foot long. Very gravely he unscrewed the head and dumped out a scroll of thick yellow paper closely covered with writing on both sides. At a nod from Le Bihan he handed me the scroll. But I could make nothing of the coarse writing, now faded to a dull brown.

"Come, come, Le Bihan," I said impatiently, "translate it, won't you? You and Max Fortin make a lot of mystery out of nothing, it seems."

Le Bihan went to the edge of the pit where the three Bannalec men were digging, gave an order or two in Breton, and turned to me.

As I came to the edge of the pit the Bannalec men were removing a square piece of sailcloth from what appeared to be a pile of cobblestones.

"Look!" said Le Bihan shrilly. I looked. The pile below was a heap of skulls. After a moment I clambered down the gravel sides of the pit and walked over to the men of Bannalec. They saluted me gravely, leaning on their picks and shovels, and wiping their sweating faces with sunburned hands.

"How many?" said I in Breton.

"Thirty-eight," they replied.

I glanced around. Beyond the heap of skulls lay two piles of human bones. Beside these was a mound of broken, rusted bits of iron and steel. Looking closer, I saw that this mound was composed of rusty bayonets, sabre blades, scythe blades, with here and there a tarnished buckle attached to a bit of leather hard as iron.

I picked up a couple of buttons and a belt plate. The buttons bore the royal arms of England; the belt plate was emblazoned with the English arms, and also with the number "27."

"I have heard my grandfather speak of the terrible English regiment, the 27th Foot, which landed and stormed the fort up there," said one of the Bannalec men.

"Oh!" said I; "then these are the bones of English soldiers?"

"Yes," said the men of Bannalec.

Le Bihan was calling to me from the edge of the pit above, and I handed the belt plate and buttons to the men and climbed the side of the excavation.

"Well," said I, trying to prevent Mome from leaping up and licking my face as I emerged from the pit, "I suppose you know what these bones are. What are you going to do with them?"

"There was a man," said Le Bihan angrily, "an Englishman, who passed here in a dogcart on his way to Quimper about an hour ago, and what do you suppose he wished to do?"

"Buy the relics?" I asked, smiling.

"Exactly—the pig!" piped the mayor of St. Gildas. "Jean Marie Tregunc, who found the bones, was standing there where Max Fortin stands, and do you know what he answered? He spat upon the ground, and said: 'Pig of an Englishman, do you take me for a desecrator of graves?'"

I knew Tregunc, a sober, blue-eyed Breton, who lived from one year's end to the other without being able to afford a single bit of meat for a meal.

"How much did the Englishman offer Tregunc?" I asked.

"Two hundred francs for the skulls alone."

I thought of the relic hunters and the relic buyers on the battlefields of our civil war.

"Seventeen hundred and sixty is long ago," I said.

"Respect for the dead can never die," said Fortin.

"And the English soldiers came here to kill your fathers and burn your homes," I continued.

"They were murderers and thieves, but—they are dead," said Tregunc, coming up from the beach below, his long sea rake balanced on his dripping jersey.

"How much do you earn every year, Jean Marie?" I asked, turning to shake hands with him.

"Two hundred and twenty francs, monsieur."

"Forty-five dollars a year," I said. "Bah! you are worth more. Jean. Will you take care of my garden for me? My wife wished me to ask you. I think it would be worth one hundred francs a month

to you and to me. Come on, Le Bihan—come along, Fortin—and you, Durand. I want somebody to translate that list into French for me.”

Tregunc stood gazing at me, his blue eyes dilated.

“You may begin at once,” I said, smiling, “if the salary suits you?”

“It suits,” said Tregunc, fumbling for his pipe in a silly way that annoyed Le Bihan.

“Then go and begin your work,” cried the mayor impatiently; and Tregunc started across the moors toward St. Gildas, taking off his velvet-ribbed cap to me and gripping his sea rake very hard.

“You offer him more than my salary,” said the mayor, after a moment’s contemplation of his silver buttons.

“Pooh!” said I, “what do you do for your salary except play dominoes with Max Fortin at the Groix Inn?”

Le Bihan turned red, but Durand rattled his sabre and winked at Max Fortin, and I slipped my arm through the arm of the sulky magistrate, laughing.

“There’s a shady spot under the cliff,” I said; “come on, Le Bihan, and read me what is in the scroll.”

In a few moments we reached the shadow of the cliff, and I threw myself upon the turf, chin on hand, to listen.

The gendarme, Durand, also sat down, twisting his moustache into needlelike points. Fortin leaned against the cliff, polishing his glasses and examining us with vague, near-sighted eyes; and Le Bihan, the mayor, planted himself in our midst, rolling up the scroll and tucking it under his arm.

“First of all,” he began in a shrill voice, “I am going to light my pipe, and while lighting it I shall tell you what I have heard about the attack on the fort yonder. My father told me; his father told him.”

He jerked his head in the direction of the ruined fort, a small square stone structure on the sea cliff, now nothing but crumbling walls. Then he slowly produced a tobacco pouch, a bit of flint and tinder, and a long-stemmed pipe fitted with a microscopical bowl of baked clay. To fill such a pipe requires ten minutes’ close attention. To smoke it to a finish takes but four puffs. It is very Breton, this Breton pipe. It is the crystallization of everything Breton.

“Go on,” said I, lighting a cigarette.

“The fort,” said the mayor, “was built by Louis XIV, and was dismantled twice by the English. Louis XV restored it in 1739. In 1760 it was carried by assault by the English. They came across from the island of Groix—three shiploads—and they stormed the fort and sacked St. Julien yonder, and they started to burn St. Gildas—you can see the marks of their bullets on my house yet; but the men of Bannalec and the men of Lorient fell upon them with pike and scythe and blunderbuss, and those who did not run away lie there below in the gravel pit now—thirty-eight of them.”

“And the thirty-ninth skull?” I asked, finishing my cigarette.

The mayor had succeeded in filling his pipe, and now he began to put his tobacco pouch away.

“The thirty-ninth skull,” he mumbled, holding the pipestem between his defective teeth—“the thirty-ninth skull is no business of mine. I have told the Bannalec men to cease digging.”

"But what is—whose is the missing skull?" I persisted curiously.

The mayor was busy trying to strike a spark to his tinder. Presently he set it aglow, applied it to his pipe, took the prescribed four puffs, knocked the ashes out of the bowl, and gravely replaced the pipe in his pocket.

"The missing skull?" he asked.

"Yes," said I impatiently.

The mayor slowly unrolled the scroll and began to read, translating from the Breton into French. And this is what he read:

"On the Cliffs of St. Gildas,

"April 13, 1760.

"On this day, by order of the Count of Soisic, general in chief of the Breton forces now lying in Kerselec Forest, the bodies of thirty-eight English soldiers of the 27th, 50th, and 72d regiments of Foot were buried in this spot, together with their arms and equipments."

The mayor paused and glaced at me reflectively.

"Go on, Le Bihan," I said.

"With them," continued the mayor, turning the scroll and reading on the other side, "was buried the body of that vile traitor who betrayed the fort to the English. The manner of his death was as follows: By order of the most noble Count of Soisic, the traitor was first branded upon the forehead with the brand of an arrowhead. The iron burned through the flesh, and was pressed heavily so that the brand should even burn into the bone of the skull. The traitor was then led out and bidden to kneel. He admitted having guided the English from the island of Groix. Although a priest and a Frenchman, he had violated his priestly office to aid him in discovering the password to the fort. This password he extorted during confession from a young Breton girl who was in the habit of rowing across from the island of Groix to visit her husband in the fort. When the fort fell, this young girl, crazed by the death of her husband, sought the Count of Soisic and told how the priest had forced her to confess to him all she knew about the fort. The priest was arrested at St. Gildas as he was about to cross the river to Lorient. When arrested he cursed the girl, Marie Trevec——"

"What!" I exclaimed, "Marie Trevec!"

"Marie Trevec," repeated Le Bihan; "the priest cursed Marie Trevec, and all her family and descendants. He was shot as he knelt, having a mask of leather over his face, because the Bretons who composed the squad of execution refused to fire at a priest unless his face was concealed. The priest was l'Abbe Sorgue, commonly known as the Black Priest on account of his dark face and swarthy eyebrows. He was buried with a stake through his heart."

Le Bihan paused, hesitated, looked at me, and handed the manuscript back to Durand. The gendarme took it and slipped it into the brass cylinder.

"So," said I, "the thirty-ninth skull is the skull of the Black Priest."

"Yes," said Fortin. "I hope they won't find it."

"I have forbidden them to proceed," said the mayor querulously. "You heard me, Max Fortin."

I rose and picked up my gun. Mome came and pushed his head into my hand.

"That's a fine dog," observed Durand, also rising.

"Why don't you wish to find his skull?" I asked Le Bihan. "It would be curious to see whether the arrow brand really burned into the bone."

"There is something in that scroll that I didn't read to you," said the mayor grimly. "Do you wish to know what it is?"

"Of course," I replied in surprise.

"Give me the scroll again, Durand," he said; then he read from the bottom: "I, l'Abbe Sorgue, forced to write the above by my executioners, have written it in my own blood; and with it I leave my curse. My curse on St. Gildas, on Marie Trevec, and on her descendants. I will come back to St. Gildas when my remains are disturbed. Woe to that Englishman whom my branded skull shall touch!"

"What rot!" I said. "Do you believe it was really written in his own blood?"

"I am going to test it," said Fortin, "at the request of Monsieur le Maire. I am not anxious for the job, however."

"See," said Le Bihan, holding out the scroll to me, "it is signed, l'Abbe Sorgue."

I glanced curiously over the paper.

"It must be the Black Priest," I said. "He was the only man who wrote in the Breton language. This is a wonderfully interesting discovery, for now, at last, the mystery of the Black Priest's disappearance is cleared up. You will, of course, send this scroll to Paris, Le Bihan?"

"No," said the mayor obstinately, "it shall be buried in the pit below where the rest of the Black Priest lies."

I looked at him and recognised that argument would be useless. But still I said, "It will be a loss to history, Monsieur Le Bihan."

"All the worse for history, then," said the enlightened Mayor of St. Gildas.

We had sauntered back to the gravel pit while speaking. The men of Bannalec were carrying the bones of the English soldiers toward the St. Gildas cemetery, on the cliffs to the east, where already a knot of white-coiffed women stood in attitudes of prayer; and I saw the sombre robe of a priest among the crosses of the little graveyard.

"They were thieves and assassins; they are dead now," muttered Max Fortin.

"Respect the dead," repeated the Mayor of St. Gildas, looking after the Bannalec men.

"It was written in that scroll that Marie Trevec, of Groix Island, was cursed by the priest—she and her descendants," I said, touching Le Bihan on the arm. "There was a Marie Trevec who married an Yves Trevec of St. Gildas——"

"It is the same," said Le Bihan, looking at me obliquely.

"Oh!" said I; "then they were ancestors of my wife."

"Do you fear the curse?" asked Le Bihan.

"What?" I laughed.

"There was the case of the Purple Emperor," said Max Fortin timidly.

Startled for a moment, I faced him, then shrugged my shoulders and kicked at a smooth bit of rock which lay near the edge of the pit, almost embedded in gravel.

"Do you suppose the Purple Emperor drank himself crazy because he was descended from Marie Trevec?" I asked contemptuously.

"Of course not," said Max Fortin hastily.

"Of course not," piped the mayor. "I only—— Hello! what's that you're kicking?"

"What?" said I, glancing down, at the same time involuntarily giving another kick. The smooth bit of rock dislodged itself and rolled out of the loosened gravel at my feet.

"The thirty-ninth skull!" I exclaimed. "By jingo, it's the noddle of the Black Priest! See! there is the arrowhead branded on the front!"

The mayor stepped back. Max Fortin also retreated. There was a pause, during which I looked at them, and they looked anywhere but at me.

"I don't like it," said the mayor at last, in a husky, high voice. "I don't like it! The scroll says he will come back to St. Gildas when his remains are disturbed. I—I don't like it, Monsieur Darrel——"

"Bosh!" said I; "the poor wicked devil is where he can't get out. For Heaven's sake, Le Bihan, what is this stuff you are talking in the year of grace 1896?"

The mayor gave me a look.

"And he says 'Englishman.' You are an Englishman, Monsieur Darrel," he announced.

"You know better. You know I'm an American."

"It's all the same," said the Mayor of St. Gildas, obstinately.

"No, it isn't!" I answered, much exasperated, and deliberately pushed the skull till it rolled into the bottom of the gravel pit below.

"Cover it up," said I; "bury the scroll with it too, if you insist, but I think you ought to send it to Paris. Don't look so gloomy, Fortin, unless you believe in were-wolves and ghosts. Hey, what the——what the devil's the matter with you, anyway? What are you staring at, Le Bihan?"

"Come, come," muttered the mayor in a low, tremulous voice, "it's time we got out of this. Did you see? Did you see, Fortin?"

"I saw," whispered Max Fortin, pallid with fright.

The two men were almost running across the sunny pasture now, and I hastened after them, demanding to know what was the matter.

"Matter!" chattered the mayor, gasping with exasperation and terror. "The skull is rolling uphill again!" and he burst into a terrified gallop. Max Fortin followed close behind.

I watched them stampeding across the pasture, then turned toward the gravel pit, mystified, incredulous. The skull was lying on the edge of the pit, exactly where it had been before I pushed it over the edge. For a second I stared at it; a singular chilly feeling crept up my spinal column, and I turned and walked away, sweat starting from the root of every hair on my head. Before I had gone twenty paces the absurdity of the whole thing struck me. I halted, hot with shame and annoyance, and retraced my steps.

There lay the skull.

"I rolled a stone down instead of the skull," I muttered to myself. Then with the butt of my gun I pushed the skull over the

edge of the pit and watched it roll to the bottom; and as it struck the bottom of the pit, Mome, my dog, suddenly whipped his tail between his legs, whimpered, and made off across the moor.

"Mome!" I shouted, angry and astonished; but the dog only fled the faster, and I ceased calling from sheer surprise.

"What the mischief is the matter with that dog!" I thought. He had never before played me such a trick.

Mechanically I glanced into the pit, but I could not see the skull. I looked down. The skull lay at my feet again, touching them.

"Good heavens!" I stammered, and struck at it blindly with my gunstock. The ghastly thing flew into the air, whirling over and over, and rolled again down the sides of the pit to the bottom. Breathlessly I stared at it, then, confused and scarcely comprehending, I stepped back from the pit, still facing it, one, ten, twenty paces, my eyes almost starting from my head, as though I expected to see the thing roll up from the bottom of the pit under my very gaze. At last I turned my back to the pit and strode out across the gorse-covered moorland toward my home. As I reached the road that winds from St. Gildas to St. Julien I gave one hasty glance at the pit over my shoulder. The sun shone hot on the sod about the excavation. There was something white and bare and round on the turf at the edge of the pit. It might have been a stone; there were plenty of them lying about.

II

When I entered my garden I saw Mome sprawling on the stone doorstep. He eyed me sideways and flopped his tail.

"Are you not mortified, you idiot dog?" I said, looking about the upper windows for Lys.

Mome rolled over on his back and raised one deprecating fore-paw, as though to ward off calamity.

"Don't act as though I was in the habit of beating you to death," I said, disgusted. I had never in my life raised whip to the brute. "But you are a fool dog," I continued. "No, you needn't come to be babied and wept over; Lys can do that, if she insists, but I am ashamed of you, and you can go to the devil."

Mome slunk off into the house, and I followed, mounting directly to my wife's boudoir. It was empty.

"Where has she gone?" I said, looking hard at Mome, who had followed me. "Oh! I see you don't know. Don't pretend you do. Come off that lounge! Do you think Lys wants tan-coloured hairs all over her lounge?"

I rang the bell for Catherine and 'Fine, but they didn't know where "Madame" had gone; so I went into my room, bathed, exchanged my somewhat grimy shooting clothes for a suit of warm, soft knickerbockers, and, after lingering some extra moments over my toilet—for I was particular, now that I had married Lys—I went down to the garden and took a chair out under the fig-trees.

"Where can she be?" I wondered. Mome came sneaking out to be comforted, and I forgave him for Lys's sake, whereupon he frisked.

"You bounding cur," said I, "now what on earth started you off across the moor? If you do it again I'll push you along with a charge of dust shot."

As yet I had scarcely dared think about the ghastly hallucination of which I had been a victim, but now I faced it squarely, flushing a little with mortification at the thought of my hasty retreat from the gravel pit.

"To think," I said aloud, "that those old woman's tales of Max Fortin and Le Bihan should have actually made me see what didn't exist at all! I lost my nerve like a schoolboy in a dark bedroom." For I knew now that I had mistaken a round stone for a skull each time, and had pushed a couple of big pebbles into the pit instead of the skull itself.

"By jingo!" said I, "I'm nervous; my liver must be in a devil of a condition if I see such things when I'm awake! Lys will know what to give me."

I felt mortified and irritated and sulky, and thought disgustingly of Le Bihan and Max Fortin.

But after a while I ceased speculating, dismissed the mayor, the chemist, and the skull from my mind, and smoked pensively, watch-

ing the sun low dipping in the western ocean. As the twilight fell for a moment over ocean and moorland, a wistful, restless happiness filled my heart, the happiness that all men know—all men who have loved.

Slowly the purple mist crept out over the sea; the cliffs darkened; the forest was shrouded.

Suddenly the sky above burned with the afterglow, and the world was alight again.

Cloud after cloud caught the rose dye; the cliffs were tinted with it; moor and pasture, heather and forest burned and pulsated with the gentle flush. I saw the gulls turning and tossing above the sand bar, their snowy wings tipped with pink; I saw the sea swallows sheering the surface of the still river, stained to its placid depths with warm reflections of the clouds. The twitter of drowsy hedge birds broke out in the stillness, a salmon rolled its shining side above tide-water.

The interminable monotone of the ocean intensified the silence. I sat motionless, holding my breath as one who listens to the first low rumour of an organ. All at once the pure whistle of a nightingale cut the silence, and the first moonbeam silvered the wastes of mist-hung waters.

I raised my head.

Lys stood before me in the garden.

When we had kissed each other, we linked arms and moved up and down the gravel walks, watching the moonbeams sparkle on the sand bar as the tide ebbed and ebbed. The broad beds of white pinks about us were atremble with hovering white moths; the October roses hung all abloom, perfuming the salt wind.

"Sweetheart," I said, "where is Yvonne? Has she promised to spend Christmas with us?"

"Yes, Dick; she drove me down from Plougat this afternoon. She sent her love to you. I am not jealous. What did you shoot?"

"A hare and four partridges. They are in the gun room. I told Catherine not to touch them until you had seen them."

Now I suppose I knew that Lys could not be particularly enthusiastic over game or guns; but she pretended she was, and always scornfully denied that it was for my sake and not for the pure love of sport. So she dragged me off to inspect the rather meagre game bag, and she paid me pretty compliments and gave a little cry of delight and pity as I lifted the enormous hare out of the sack by his ears.

"He'll eat no more of our lettuce," I said, attempting to justify the assassination.

"Unhappy little bunny—and what a beauty! O Dick, you are a splendid shot, are you not?"

I evaded the question and hauled out a partridge.

"Poor little dead things!" said Lys in a whisper; "it seems a pity—doesn't it, Dick? But then you are so clever——"

"We'll have them broiled," I said guardedly; "tell Catherine."

Catherine came in to take away the game, and presently 'Fine Lelocard, Lys's maid, announced dinner, and Lys tripped away to her boudoir."

I stood an instant contemplating her blissfully, thinking, "My boy, you're the happiest fellow in the world—you're in love with your wife!"

I walked into the dining room, beamed at the plates, walked out again; met Tregunc in the hallway, beamed on him; glanced into the kitchen, beamed at Catherine, and went up stairs, still beaming.

Before I could knock at Lys's door it opened, and Lys came hastily out. When she saw me she gave a little cry of relief, and nestled close to my breast.

"There is something peering in at my window," she said.

"What!" I cried angrily.

"A man, I think, disguised as a priest, and he has a mask on. He must have climbed up by the bay tree."

I was down the stairs and out of doors in no time. The moonlit garden was absolutely deserted. Tregunc came up, and together we searched the hedge and shrubbery around the house and out to the road.

"Jean Marie," said I at length, "loose my bulldog—he knows you—and take your supper on the porch where you can watch. My wife says the fellow is disguised as a priest, and wears a mask."

Tregunc showed his white teeth in a smile. "He will not care to venture in here again, I think, Monsieur Darrel."

I went back and found Lys seated quietly at the table.

"The soup is ready, dear," she said. "Don't worry; it was only some foolish lout from Bannalec. No one in St. Gildas or St. Julien would do such a thing."

I was too much exasperated to reply at first, but Lys treated it as a stupid joke, and after a while I began to look at it in that light.

Lys told me about Yvonne, and reminded me of my promise to have Herbert Stuart down to meet her.

"You wicked diplomat!" I protested. "Herbert is in Paris, and hard at work for the Salon."

"Don't you think he might spare a week to flirt with the prettiest girl in Finistere?" inquired Lys innocently.

"Prettiest girl! Not much!" I said.

"Who is, then?" urged Lys.

I laughed a trifle sheepishly.

"I suppose you mean me, Dick," said Lys, colouring up.

"Now I bore you, don't I?"

"Bore me? Ah, no, Dick."

After coffee and cigarettes were served I spoke about Tregunc, and Lys approved.

"Poor Jean! he will be glad, won't he? What a dear fellow you are!"

"Nonsense," said I: "we need a gardener; you said so yourself, Lys."

But Lys leaned over and kissed me, and then bent down and hugged Mome, who whistled through his nose in sentimental appreciation.

"I am a very happy woman," said Lys.

"Mome was a very bad dog today," I observed.

"Poor Mome!" said Lys, smiling.

When dinner was over and Mome lay snoring before the blaze—for the October nights are often chilly in Finistere—Lys curled up in the chimney corner with her embroidery, and gave me a swift glance from under her drooping lashes.

"You look like a schoolgirl, Lys," I said teasingly. "I don't believe you are sixteen yet."

She pushed back her heavy burnished hair thoughtfully. Her wrist was as white as surf foam.

"Have we been married four years? I don't believe it," I said.

She gave me another swift glance and touched the embroidery on her knee, smiling faintly.

"I see," said I, also smiling at the embroidered garment. "Do you think it will fit?"

"Fit?" repeated Lys. Then she laughed.

"And," I persisted, "are you perfectly sure that you—er—we shall need it?"

"Perfectly," said Lys. A delicate colour touched her cheeks and neck. She held up the little garment, all fluffy with misty lace and wrought with quaint embroidery.

"It is very gorgeous," said I; "don't use your eyes too much, dearest. May I smoke a pipe?"

"Of course," she said, selecting a skein of pale blue silk.

For a while I sat and smoked in silence, watching her slender fingers among the tinted silks and thread of gold.

Presently she spoke: "What did you say your crest is, Dick?"

"My crest? Oh, something or other rampant on a something or other——"

"Dick!"

"Dearest?"

"Don't be flippant."

"But I really forget. It's an ordinary crest; everybody in New York has them. No family should be without 'em."

"You are disagreeable, Dick. Send Josephine upstairs for my album."

"Are you going to put that crest on the—the—whatever it is?"

"I am; and my own crest, too."

I thought of the Purple Emperor and wondered a little.

"You didn't know I had one, did you?" she smiled.

"What is it?" I replied evasively.

"You shall see. Ring for Josephine."

I rang, and, when 'Fine appeared, Lys gave her some orders in a low voice, and Josephine trotted away, bobbing her white-coiffed head with a "Bien, madame!"

After a few minutes she returned, bearing a tattered, musty volume, from which the gold and blue had mostly disappeared.

I took the book in my hands and examined the ancient emblazoned covers.

"Lilies!" I exclaimed.

"Fleur-de-lis," said my wife demurely.

"Oh!" said I, astonished, and opened the book.

"You have never before seen this book?" asked Lys, with a touch of malice in her eyes.

"You know I haven't. Hello! what's this? Oho! So there should be a de before Trevec? Lys de Trevec? Then why in the world did the Purple Emperor——"

"Dick!" cried Lys.

"All right," said I. "Shall I read about the Sieur de Trevec who rode to Saladin's tent alone to seek for medicine for St. Louis? or shall I read about—what is it? Oh, here it is, all down in black

and white—about the Marquis de Trevec who drowned himself before Alva's eyes rather than surrender the banner of the fleur-de-lis to Spain? It's all written here. But, dear, how about that soldier named Trevec who was killed in the old fort on the cliff yonder?"

"He dropped the de, and the Trevecs since then have been Republicans," said Lys—"all except me."

"That's quite right," said I; "it is time that we Republicans should agree upon some feudal system. My dear, I drink to the king!" and I raised my wine-glass and looked at Lys.

"To the king," said Lys, flushing. She smoothed out the tiny garment on her knees; she touched the glass with her lips; her eyes were very sweet. I drained the glass to the king.

After a silence I said: "I will tell the king stories. His Majesty shall be amused."

"His Majesty," repeated Lys softly.

"Or hers," I laughed. "Who knows?"

"Who knows?" murmured Lys, with a gentle sigh.

"I know some stories about Jack the Giant-Killer," I announced. "Do you, Lys?"

"I? No, not about a giant-killer, but I know all about the werewolf, and Jeanne-la-Flamme, and the Man in Purple Tatters, and—O dear me! I know lots more."

"You are very wise," said I. "I shall teach his Majesty English."

"And I Breton," cried Lys jealously.

"I shall bring playthings to the king," said I—"big green lizards from the gorse, little gray mullets to swim in glass globes, baby rabbits from the forest of Kerselec——"

"And I," said Lys, "will bring the first primrose, the first branch of aubepine, the first jonquil, to the king—my king."

"Our king," said I; and there was peace in Finistere.

I lay back, idly turning the leaves of the curious old volume.

"I am looking," said I, "for the crest."

"The crest, dear? It is a priest's head with an arrow-shaped mark on the forehead, on a field——"

I sat up and stared at my wife.

"Dick, whatever is the matter?" she smiled. "The story is there in that book. Do you care to read it? No? Shall I tell it to you? Well, then: It happened in the third crusade. There was a monk whom men called the Black Priest. He turned apostate, and sold himself to the enemies of Christ. A Sieur de Trevec burst into the Saracen camp, at the head of only one hundred lances, and carried the Black Priest away out of the very midst of their army."

"So that is how you come by the crest," I said quietly; but I thought of the branded skull in the gravel pit, and wondered.

"Yes," said Lys. "The Sieur de Trevec cut the Black Priest's head off, but first he branded him with an arrow mark on the forehead. The book says it was a pious action, and the Sieur de Trevec got great merit by it. But I think it was cruel, the branding," she sighed

"Did you ever hear of any other Black Priest?"

"Yes. There was one in the last century, here in St. Gildas. He cast a white shadow in the sun. He wrote in the Breton language. Chronicles, too, I believe. I never saw them. His name was the same as that of the old chronicler, and of the other priest, Jacques Sorgue. Some said he was a lineal descendant of the traitor. Of

course the first Black Priest was bad enough for anything. But if he did have a child, it need not have been the ancestor of the last Jacques Sorgue. They say this one was a holy man. They say he was so good he was not allowed to die, but was caught up to heaven one day," added Lys, with believing eyes.

I smiled.

"But he disappeared," persisted Lys.

"I'm afraid his journey was in another direction," I said jestingly, and thoughtlessly told her the story of the morning. I had utterly forgotten the masked man at her window, but before I finished I remembered him fast enough, and realized what I had done as I saw her face whiten.

"Lys," I urged tenderly, "that was only some clumsy clown's trick. You said so yourself. You are not superstitious, my dear?"

Her eyes were on mine. She slowly drew the little gold cross from her bosom and kissed it. But her lips trembled as they pressed the symbol of faith.

III

About nine o'clock the next morning I walked into the Groix Inn and sat down at the long discoloured oaken table, nodding good-day to Marianne Bruyere, who in turn bobbed her white coiffe at me.

"My clever Bannalec maid," said I, "what is good for a stirrup-cup at the Groix Inn?"

"Schist?" she inquired in Breton.

"With a dash of red wine, then," I replied.

She brought the delicious Quimperle cider, and I poured a little Bordeaux into it. Marianne watched me with laughing black eyes.

"What makes your cheeks so red, Marianne?" I asked. "Has Jean Marie been here?"

"We are to be married, Monsieur Darrel," she laughed.

"Ah! Since when has Jean Marie Tregunc lost his head?"

"His head? Oh, Monsieur Darrel—his heart, you mean!"

"So I do," said I. "Jean Marie is a practical fellow."

"It is all due to your kindness——" began the girl, but I raised my hand and held up the glass.

"It's due to himself. To your happiness, Marianne;" and I took a hearty draught of the schist. "Now," said I, "tell me where I can find Le Bihan and Max Fortin."

"Monsieur Le Bihan and Monsieur Fortin are above in the broad room. I believe they are examining the Red Admiral's effects."

"To send them to Paris? Oh, I know. May I go up, Marianne?"

"And God go with you," smiled the girl.

When I knocked at the door of the broad room above little Max Fortin opened it. Dust covered his spectacles and nose; his hat, with the tiny velvet ribbons fluttering, was all awry.

"Come in, Monsieur Darrel," he said; "the mayor and I are packing up the effects of the Purple Emperor and of the poor Red Admiral."

"The collections?" I asked, entering the room. "You must be very careful in packing those butterfly cases; the slightest jar might break wings and antennae, you know."

Le Bihan shook hands with me and pointed to the great pile of boxes.

"They're all cork lined," he said, "but Fortin and I are putting felt around each box. The Entomological Society of Paris pays the freight."

The combined collections of the Red Admiral and the Purple Emperor made a magnificent display.

I lifted and inspected case after case set with gorgeous butterflies and moths, each specimen carefully labelled with the name in Latin. There were cases filled with crimson tiger moths all aflame with colour; cases devoted to the common yellow butterflies; symphonies in orange and pale yellow; cases of soft gray and dun-

coloured sphinx moths; and cases of garish nettle-bred butterflies of the numerous family of *Vanessa*.

All alone in a great case by itself was pinned the purple emperor, the *Apatura Iris*, that fatal specimen that had given the Purple Emperor his name and quietus.

I remembered the butterfly, and stood looking at it with bent eyebrows.

Le Bihan glanced up from the floor where he was nailing down the lid of a box full of cases.

"It is settled, then," said he, "that madame, your wife, gives the Purple Emperor's entire collection to the city of Paris?"

I nodded.

"Without accepting anything for it?"

"It is a gift," I said.

"Including the purple emperor there in the case? That butterfly is worth a great deal of money," persisted Le Bihan.

"You don't suppose that we would wish to sell that specimen, do you?" I answered a trifle sharply.

"If I were you I should destroy it," said the mayor in his high-pitched voice.

"That would be nonsense," said I—"like your burying the brass cylinder and scroll yesterday."

"It was not nonsense," said Le Bihan doggedly, "and I should prefer not to discuss the subject of the scroll."

I looked at Max Fortin, who immediately avoided my eyes.

"You are a pair of superstitious old women," said I, digging my hands into my pockets; "you swallow every nursery tale that is invented."

"What of it?" said Le Bihan sulkily; "there's more truth than lies in most of 'em."

"Oh!" I sneered, "does the Mayor of St. Gildas and St. Julien believe in the *Loup-garou*?"

"No, not in the *Loup-garou*."

"In what, then—*Jeanne-la-Flamme*?"

"That," said Le Bihan with conviction, "is history."

"The devil it is!" said I; "and perhaps, monsieur the mayor, your faith in giants is unimpaired?"

"There were giants—everybody knows it," growled Max Fortin.

"And you a chemist!" I observed scornfully.

"Listen, Monsieur Darrel," squeaked Le Bihan; "you know yourself that the Purple Emperor was a scientific man. Now suppose I should tell you that he always refused to include in his collection a *Death's Messenger*?"

"A what?" I exclaimed.

"You know what I mean—that moth that flies by night; some call it the *Death's Head*, but in St. Gildas we call it '*Death's Messenger*.'"

"Oh!" said I, "you mean that big sphinx moth that is commonly known as the '*death's-head moth*.' Why the mischief should the people here call it *death's messenger*?"

"For hundreds of years it has been known as *death's messenger* in St. Gildas," said Max Fortin. "Even Froissart speaks of it in his commentaries on Jacques Sargue's *Chronicles*. The book is in your library."

"Sorgue? And who was Jacques Sorgue? I never read his book."

"Jacques Sorgue was the son of some unfrocked priest—I forget. It was during the crusades."

"Good Heavens!" I burst out, "I've been hearing of nothing but crusades and priests and death and sorcery ever since I kicked that skull into the gravel pit, and I am tired of it, I tell you frankly. One would think we lived in the dark ages. Do you know what year of our Lord it is, Le Bihan?"

"Eighteen hundred and ninety-six," replied the mayor.

"And yet you two hulking men are afraid of a death's-head moth."

"I don't care to have one fly into the window," said Max Fortin; "it means evil to the house and the people in it."

"God alone knows why he marked one of his creatures with a yellow death's head on the back," observed Le Bihan piously, "but I take it that he meant it as a warning; and I propose to profit by it," he added triumphantly.

"See here, Le Bihan," I said; "by a stretch of imagination one can make out a skull on the thorax of a certain big sphinx moth. What of it?"

"It is a bad thing to touch," said the mayor, wagging his head.

"It squeaks when handled," added Max Fortin.

"Some creatures squeak all the time," I observed, looking hard at Le Bihan.

"Pigs," added the mayor.

"Yes, and asses," I replied. "Listen, Le Bihan: do you mean to tell me that you saw that skull roll uphill yesterday?"

The mayor shut his mouth tightly and picked up his hammer.

"Don't be obscene," I said; "I asked you a question."

"And I refuse to answer," snapped Le Bihan. "Fortin saw what I saw; let him talk about it."

"I don't say that I saw it actually roll up out of the pit, all by itself," said Fortin with a shiver, "but—but then, how did it come up out of the pit, if it didn't roll up all by itself?"

"It didn't come up at all; that was a yellow cobblestone that you mistook for the skull again," I replied. "You were nervous, Max."

"A—a very curious cobblestone, Monsieur Darrel," said Fortin.

"I also was a victim to the same hallucination," I continued, "and I regret to say that I took the trouble to roll two innocent cobblestones into the gravel pit, imagining each time that it was the skull I was rolling."

"It was," observed Le Bihan with a morose shrug.

"It just shows," said I, ignoring the mayor's remark, "how easy it is to fix up a train of coincidences so that the result seems to savour of the supernatural. Now, last night my wife imagined that she saw a priest in a mask peer in at her window——"

Fortin and Le Bihan scrambled hastily from their knees, dropping hammer and nails.

"W-h-a-t—what's that?" demanded the mayor.

I repeated what I had said. Max Fortin turned livid.

"My God!" muttered Le Bihan, "the Black Priest is in St. Gildas!"

"D-don't you—you know the old prophecy?" stammered Fortin; "Froissart quotes it from Jacques Sorgue:

'When the Black Priest rises from the dead,
St. Gildas folk shall shriek in bed;
When the Black Priest rises from his grave,
May the good God St. Gildas save!'

"Aristide Le Bihan," I said angrily, "and you, Max Fortin, I've got enough of this nonsense! Some foolish lout from Bannalec has been in St. Gildas playing tricks to frighten old fools like you. If you have nothing better to talk about than nursery legends I'll wait until you come to your senses. Good-morning." And I walked out, more disturbed than I cared to acknowledge to myself.

The day had become misty and overcast. Heavy, wet clouds hung in the east. I heard the surf thundering against the cliffs, and the gray gulls squealed as they tossed and turned high in the sky. The tide was creeping across the river sands, higher, higher, and I saw the seaweed floating on the beach, and the *lancons* springing from the foam, silvery thread-like flashes in the gloom. Curlew were flying up the river in twos and threes; the timid sea swallows skimmed across the moors toward some quiet, lonely pool, safe from the coming tempest. In every hedge field birds were gathering, huddling together, twittering restlessly.

When I reached the cliffs I sat down, resting my chin on my clenched hands. Already a vast curtain of rain, sweeping across the ocean miles away, hid the island of Groix. To the east, behind the white semaphore on the hills, black clouds crowded up over the horizon. After a little the thunder boomed, dull, distant, and slender skeins of lightning unravelled across the crest of the coming storm. Under the cliff at my feet the surf rushed foaming over the shore, and the *lancons* jumped and skipped and quivered until they seemed to be but the reflections of the meshed lightning.

I turned to the east. It was raining over Groix, it was raining at Sainte Barbe, it was raining now at the semaphore. High in the storm whirl a few gulls pitched; a nearer cloud trailed veils of rain in its wake; the sky was spattered with lightning; the thunder boomed.

As I rose to go, a cold raindrop fell upon the back of my hand, and another, and yet another on my face. I gave a last glance at the sea, where the waves were bursting into strange white shapes that seemed to fling out menacing arms toward me. Then something moved on the cliff, something black as the black rock it clutched—a filthy cormorant, craning its hideous head at the sky.

Slowly I plodded homeward across the sombre moorland, where the gorse stems glimmered with a dull metallic green, and the heather, no longer violet and purple, hung drenched and dun-coloured among the dreary rocks. The wet turf creaked under my heavy boots, the black-thorn scraped and grated against knee and elbow. Over all lay a strange light, pallid, ghastly, where the sea spray whirled across the landscape and drove into my face until it grew

numb with the cold. In broad bands, rank after rank, billow on billow, the rain burst out across the endless moors, and yet there was no wind to drive it at such a pace.

Lys stood at the door as I turned into the garden, motioning me to hasten; and then for the first time I became conscious that I was soaked to the skin.

"How ever in the world did you come to stay out when such a storm threatened?" she said. "Oh, you are dripping! Go quickly and change; I have laid your warm underwear on the bed, Dick."

I kissed my wife, and went upstairs to change my dripping clothes for something more comfortable.

When I returned to the morning room there was a driftwood fire on the hearth, and Lys sat in the chimney corner embroidering.

"Catherine tells me that the fishing fleet from Lorient is out. Do you think they are in danger, dear?" asked Lys, raising her blue eyes to mine as I entered.

"There is no wind, and there will be no sea," said I, looking out of the window. Far across the moor I could see the black cliffs looming in the mist.

"How it rains!" murmured Lys; "come to the fire, Dick."

I threw myself on the fur rug, my hands in my pockets, my head on Lys's knees.

"Tell me a story," I said. "I feel like a boy of ten."

Lys raised a finger to her scarlet lips. I always waited for her to do that.

"Will you be very still, then?" she said.

"Still as death."

"Death," echoed a voice, very softly.

"Did you speak, Lys?" I asked, turning so that I could see her face.

"No; did you, Dick?"

"Who said 'death'?" I asked, startled.

"Death," echoed a voice, softly.

I sprang up and looked about. Lys rose too, her needles and embroidery falling to the floor. She seemed about to faint, leaning heavily on me, and I led her to the window and opened it a little way to give her air. As I did so the chain lightning split the zenith, the thunder crashed, and a sheet of rain swept into the room, driving with it something that fluttered—something that flapped, and squeaked, and beat upon the rug with soft, moist wings.

We bent over it together, Lys clinging to me, and we saw that it was a death's-head moth drenched with rain.

The dark day passed slowly as we sat beside the fire, hand in hand, her head against my breast, speaking of sorrow and mystery and death. For Lys believed that there were things on earth that none might understand, things that must be nameless forever and ever, until God rolls up the scroll of life and all is ended. We spoke of hope and fear and faith, and the mystery of the saints; we spoke of the beginning and the end, of the shadow of sin, of omens, and of love. The moth still lay on the floor, quivering its sombre wings in the warmth of the fire, the skull and ribs clearly etched upon its neck and body.

"If it is a messenger of death to this house," I said, "why should we fear, Lys?"

"Death should be welcome to those who love God," murmured

Lys, and she drew the cross from her breast and kissed it.

"The moth might die if I threw it out into the storm," I said after a silence.

"Let it remain," sighed Lys.

Late that night my wife lay sleeping, and I sat beside her bed and read in the Chronicle of Jacques Sorgue. I shaded the candle, but Lys grew restless, and finally I took the book down into the morning room, where the ashes of the fire rustled and whitened on the hearth.

The death's-head moth lay on the rug before the fire where I had left it. At first I thought it was dead, but, when I looked closer I saw a lambent fire in its amber eyes. The straight white shadow it cast across the floor wavered as the candle flickered.

The pages of the Chronicle of Jacques Sorgue were damp and sticky; the illuminated gold and blue initials left flakes of azure and gilt where my hand brushed them.

"It is not paper at all; it is thin parchment," I said to myself; and I held the discoloured pages close to the candle flame and read, translating laboriously:

"I, Jacques Sorgue, saw all these things. And I saw the Black Mass celebrated in the chapel of St. Gildas-on-the-Cliff. And it was said by the Abbe Sorgue, my kinsman: for which deadly sin the apostate priest was seized by the most noble Marquis of Plougastel and by him condemned to be burned with hot irons, until his seared soul quit its body and fly to its master the devil. But when the Black Priest lay in the crypt of Plougastel, his master Satan came at night and set him free, and carried him across land and sea to Mahmoud, which is Soldan or Saladin. And I, Jacques Sorgue, travelling afterward by sea, beheld with my own eyes my kinsman, the Black Priest of St. Gildas, borne along in the air upon a vast black wing, which was the wing of his master Satan. And this was seen also by two men of the crew."

I turned the page. The wings of the moth on the floor began to quiver. I read on and on, my eyes blurring under the shifting candle flame. I read of battles and of saints, and I learned how the great Soldan made his pact with Satan, and then I came to the Sieur de Trevec, and read how he seized the Black Priest in the midst of Saladin's tents and carried him away and cut off his head, first branding him on the forehead. "And before he suffered," said the Chronicle, "he cursed the Sieur de Trevec and his descendants, and he said he would surely return to St. Gildas. 'For the violence you do to me, I will do violence to you. For the evil I suffer at your hands, I will work evil on you and your descendants. Woe to your children, Sieur de Trevec!'" There was a whirr, a beating of strong wings, and my candle flashed up as in a sudden breeze. A humming filled the room; the great moth darted hither and thither, beating, buzzing, on ceiling and wall. I flung down my book and stepped forward. Now it lay fluttering upon the window sill, and for a moment I had it under my hand, but the thing squeaked and I shrank back. Then suddenly it darted across the candle flame; the light flared and went out, and at the same moment a shadow moved in the darkness outside. I raised my eyes to the window. A masked face was peering in at me.

Quick as thought I whipped out my revolver and fired every cartridge, but the face advanced beyond the window, the glass

melting away before it like mist, and through the smoke of my revolver I saw something creep swiftly into the room. Then I tried to cry out, but the thing was at my throat, and I fell backward among the ashes of the hearth.

.

When my eyes unclosed I was lying on the hearth, my head among the cold ashes. Slowly I got on my knees, rose painfully, and groped my way to a chair. On the floor lay my revolver, shining in the pale light of early morning. My mind clearing by degrees, I looked, shuddering, at the window. The glass was unbroken. I stooped stiffly, picked up my revolver and opened the cylinder. Every cartridge had been fired. Mechanically I closed the cylinder and placed the revolver in my pocket. The book, the *Chronicles of Jacques Sorgue*, lay on the table beside me, and as I started to close it I glanced at the page. It was all splashed with rain, and the lettering had run, so that the page was merely a confused blur of gold and red and black. As I stumbled toward the door I cast a fearful glance over my shoulder. The death's-head moth crawled shivering on the rug.

IV

The sun was about three hours high. I must have slept, for I was aroused by the sudden gallop of horses under our window. People were shouting and calling in the road. I sprang up and opened the sash. Le Bihan was there, an image of helplessness, and Max Fortin stood beside him, polishing his glasses. Some gendarmes had just arrived from Quimperle, and I could hear them around the corner of the house, stamping, and rattling their sabres and carbines, as they led their horses into my stable.

Lys sat up, murmuring half-sleepy, half-anxious questions.

"I don't know," I answered. "I am going out to see what it means."

"It is like the day they came to arrest you," Lys said, giving me a troubled look. But I kissed her, and laughed at her until she smiled too. Then I flung on coat and cap and hurried down the stairs.

The first person I saw standing in the road was the Brigadier Durand.

"Hello!" said I, "have you come to arrest me again? What the devil is all this fuss about anyway?"

"We were telegraphed for an hour ago," said Durand briskly, "and for a sufficient reason, I think. Look there, Monsieur Darrel!"

He pointed to the ground almost under my feet.

"Good heavens!" I cried, "where did that puddle of blood come from?"

"That's what I want to know, Monsieur Darrel. Max Fortin found it at daybreak. See, it's splashed all over the grass, too. A trail of it leads into your garden, across the flower beds to your very window, the one that opens from the morning room. There is another trail leading from this spot across the road to the cliffs, then to the gravel pit, and thence across the moor to the forest of Kerselec. We are going to mount in a minute and search the bosquets. Will you join us? Bon Dieu! but the fellow bled like an ox. Max Fortin says it's human blood, or I should not have believed it."

The little chemist of Quimperle came up at that moment, rubbing his glasses with a coloured handkerchief.

"Yes, it is human blood," he said, "but one thing puzzles me: the corpuscles are yellow. I never saw any human blood before with yellow corpuscles. But your English Doctor Thompson asserts that he has——"

"Well, it's human blood, anyway—isn't it?" insisted Durand, impatiently.

"Ye-es," admitted Max Fortin.

"Then it's my business to trail it," said the big gendarme, and he called his men and gave the order to mount.

"Did you hear anything last night?" asked Durand of me.

"I heard the rain. I wonder the rain did not wash away these traces."

"They must have come after the rain ceased. See this thick splash, how it lies over and weighs down the wet grass blades. Pah!"

It was a heavy, evil-looking clot, and I stepped back from it, my throat closing in disgust.

"My theory," said the brigadier, "is this: Some of those Biribi fishermen, probably the Icelanders, got an extra glass of cognac into their hides and quarrelled on the road. Some of them were slashed, and staggered to your house. But there is only one trail, and yet—and yet, how could all that blood come from only one person? Well, the wounded man, let us say, staggered first to your house and then back here, and he wandered off, drunk and dying, God knows where. That's my theory."

"A very good one," said I calmly. "And you are going to trail him?"

"Yes."

"When?"

"At once. Will you come?"

"Not now. I'll gallop over by-and-bye. You are going to the edge of the Kerselec forest?"

"Yes; you will hear us calling. Are you coming, Max Fortin? And you, Le Bihan? Good; take the dog-cart."

The big gendarme tramped around the corner to the stable and presently returned mounted on a strong gray horse; his sabre shone on his saddle; his pale yellow and white facings were spotless. The little crowd of white-coiffed women with their children fell back, as Durand touched spurs and clattered away followed by his two troopers. Soon after Le Bihan and Max Fortin also departed in the mayor's dingy dog-cart.

"Are you coming?" piped Le Bihan shrilly.

"In a quarter of an hour," I replied, and went back to the house.

When I opened the door of the morning room the death's-head moth was beating its strong wings against the window. For a second I hesitated, then walked over and opened the sash. The creature fluttered out, whirled over the flower beds a moment, then darted across the moorland toward the sea. I called the servants together and questioned them. Josephine, Catherine, Jean Marie Tregunc, not one of them had heard the slightest disturbance during the night. Then I told Jean Marie to saddle my horse, and while I was speaking Lys came down.

"Dearest," I began, going to her.

"You must tell me everything you know, Dick," she interrupted, looking me earnestly in the face.

"But there is nothing to tell—only a drunken brawl, and some one wounded."

"And you are going to ride—where, Dick?"

"Well, over to the edge of Kerselec forest. Durand and the mayor, and Max Fortin, have gone on, following a—a trail."

"What trail?"

"Some blood."

"Where did they find it?"

"Out in the road there." Lys crossed herself.

"Does it come near our house?"

"Yes."

"How near?"

"It comes up to the morning-room window," said I, giving in.

Her hand on my arm grew heavy. "I dreamed last night——"

"So did I——" but I thought of the empty cartridges in my revolver, and stopped.

"I dreamed that you were in great danger, and I could not move hand or foot to save you; but you had your revolver, and I called out to you to fire——"

"I did fire!" I cried excitedly.

"You—you fired?"

I took her in my arms. "My darling," I said, "something strange has happened—something that I can not understand as yet. But, of course, there is an explanation. Last night I thought I fired at the Black Priest."

"Ah!" gasped Lys.

"Is that what you dreamed?"

"Yes, yes, that was it! I begged you to fire——"

"And I did."

Her heart was beating against my breast. I held her close in silence.

"Dick," she said at length, "perhaps you killed the—the thing."

"If it was human I did not miss," I answered grimly. "And it was human," I went on, pulling myself together, ashamed of having so nearly gone to pieces. "Of course it was human! The whole affair is plain enough. Not a drunken brawl, as Durand thinks; it was a drunken lout's practical joke, for which he has suffered. I suppose I must have filled him pretty full of bullets, and he has crawled away to die in Kerselec forest. It's a terrible affair; I'm sorry I fired so hastily; but that idiot Le Bihan and Max Fortin have been working on my nerves till I am as hysterical as a schoolgirl," I ended angrily.

"You fired—but the window glass was not shattered," said Lys in a low voice.

"Well, the window was open, then. And as for the—the rest—I've got nervous indigestion, and a doctor will settle the Black Priest for me, Lys."

I glanced out of the window at Tregunc waiting with my horse at the gate.

"Dearest, I think I had better go to join Durand and the others."

"I will go too."

"Oh, no!"

"Yes, Dick."

"Don't Lys."

"I shall suffer every moment you are away."

"The ride is too fatiguing, and we can't tell what unpleasant sight you may come upon. Lys, you don't really think there is anything supernatural in this affair?"

"Dick," she answered gently, "I am a Bretonne." With both arms around my neck, my wife said, "Death is the gift of God. I

do not fear it when we are together. But alone—oh, my husband, I should fear a God who could take you away from me!”

We kissed each other soberly, simply, like two children. Then Lys hurried away to change her gown, and I paced up and down the garden waiting for her.

She came, drawing on her slender gauntlets. I swung her into the saddle, gave a hasty order to Jean Marie, and mounted.

Now, to quail under thoughts of terror on a morning like this, with Lys in the saddle beside me, no matter what had happened or might happen, was impossible. Moreover, Mome came sneaking after us. I asked Tregunc to catch him, for I was afraid he might be brained by our horses' hoofs if he followed, but the wily puppy dodged and bolted after Lys, who was trotting along the high-road. “Never mind,” I thought; “if he's hit he'll live, for he has no brains to lose.”

Lys was waiting for me in the road beside the Shrine of Our Lady of St. Gildas when I joined her. She crossed herself, I doffed my cap, then we shook out our bridles and galloped toward the forest of Kerselec.

We said very little as we rode. I always loved to watch Lys in the saddle. Her exquisite figure and lovely face were the incarnation of youth and grace; her curling hair glistened like threaded gold.

Out of the corner of my eye I saw the spoiled puppy Mome come bounding cheerfully alongside, oblivious of our horses' heels. Our road swung close to the cliffs. A filthy cormorant rose from the black rocks and flapped heavily across our path. Lys' horse reared, but she pulled him down, and pointed at the bird with her riding crop.

“I see,” said I; “it seems to be going our way. Curious to see a cormorant in a forest, isn't it?”

“It is a bad sign,” said Lys. “You know the Morbihan proverb: ‘When the cormorant turns from the sea, Death laughs in the forest, and wise woodsmen build boats.’”

“I wish,” said I sincerely, “that there were fewer proverbs in Brittany.”

We were in sight of the forest now; across the gorse I could see the sparkle of gendarmes' trappings, and the glitter of Le Bihan's silver-buttoned jacket. The hedge was low and we took it without difficulty, and trotted across the moor to where Le Bihan and Durand stood gesticulating.

They bowed ceremoniously to Lys as we rode up.

“The trail is horrible—it is a river,” said the mayor in his squeaky voice. “Monsieur Darrel, I think perhaps madame would scarcely care to come any nearer.”

Lys drew bridle and looked at me.

“It is horrible!” said Durand, walking up beside me; “it looks as though a bleeding regiment had passed this way. The trail winds and winds about there in the thickets; we lose it at times, but we always find it again. I can't understand how one man—no, nor twenty—could bleed like that!”

A halloo, answered by another, sounded from the depths of the forest.

“It's my men; they are following the trail,” muttered the brigadier. “God alone knows what is at the end!”

"Shall we gallop back, Lys?" I asked.

"No; let us ride along the western edge of the woods and dismount. The sun is so hot now, and I should like to rest for a moment," she said.

"The western forest is clear of anything disagreeable," said Durand.

"Very well," I answered; "call me, Le Bihan, if you find anything."

Lys wheeled her mare, and I followed across the springy heather, Mome trotting cheerfully in the rear.

We entered the sunny woods about a quarter of a kilometre from where we left Durand. I took Lys from her horse, flung both bridles over a limb, and, giving my wife my arm, aided her to a flat mossy rock which overhung a shallow brook gurgling among the beach trees. Lys sat down and drew off her gauntlets. Mome pushed his head into her lap, received an undeserved caress, and came doubtfully toward me. I was weak enough to condone his offence, but I made him lie down at my feet, greatly to his disgust.

I rested my head on Lys's knees, looking up at the sky through the crossed branches of the trees.

"I suppose I have killed him," I said. "It shocks me terribly, Lys."

"You could not have known, dear. He may have been a robber, and—if—not— Did—have you ever fired your revolver since that day four years ago, when the Red Admiral's son tried to kill you? But I know you have not."

"No," said I, wondering. "It's a fact, I have not. Why?"

"And don't you remember that I asked you to let me load it for you the day when Yves went off, swearing to kill you and his father?"

"Yes, I do remember. Well?"

"Well, I—I took the cartridges first to St. Gildas chapel and dipped them in holy water. You must not laugh, Dick," said Lys gently, laying her cool hands on my lips.

"Laugh, my darling!"

Overhead the October sky was pale amethyst, and the sunlight burned like orange flame through the yellow leaves of beach and oak. Gnats and midges danced and wavered overhead; a spider dropped from a twig halfway to the ground and hung suspended on the end of his gossamer thread.

"Are you sleepy, dear?" asked Lys, bending over me.

"I am—a little; I scarcely slept two hours last night," I answered.

"You may sleep, if you wish," said Lys, and touched my eyes caressingly.

"Is my head heavy on your knees?"

"No, Dick."

I was already in a half doze; still I heard the brook babbling under the beeches and the humming of forest flies overhead. Presently even these were stilled.

The next thing I knew I was sitting bolt upright, my ears ringing with a scream, and I saw Lys beside me, covering her white face with both hands.

As I sprang to my feet she cried again and clung to my knees. I saw my dog rush growling into a thicket, then I heard him whimp-

er, and he came backing out, whining, ears flat, tail down. I stooped and disengaged Lys's hand.

"Don't go, Dick!" she cried. "Oh God, it's the Black Priest!"

In a moment I had leaped across the brook and pushed my way into the thicket. It was empty. I stared about me; I scanned every tree trunk, every bush. Suddenly I saw him. He was seated on a fallen log, his head resting in his hands, his rusty black robe gathered around him. For a moment my hair stirred under my cap; sweat started on forehead and cheek-bone; then I recovered my reason, and understood that the man was human and was probably wounded to death. Ay, to death; for there, at my feet, lay the wet trail of blood, over leaves and stones, down into the little hollow, across to the figure in black resting silently under the trees.

I saw that he could not escape even if he had the strength, for before him, almost at his very feet, lay a deep, shining swamp.

As I stepped forward my foot broke a twig. At the sound the figure started a little, then its head fell forward again. Its face was masked. Walking up to the man, I bade him tell where he was wounded. Durand and the others broke through the thicket at the same moment and hurried to my side.

"Who are you who hide a masked face in a priest's robe?" said the gendarme loudly.

There was no answer.

"See—see the stiff blood all over his robe!" muttered Le Bihan to Fortin.

"He will not speak," said I.

"He may be too badly wounded," whispered Le Bihan.

"I saw him raise his head," I said; "my wife saw him creep up here."

Durand stepped forward and touched the figure.

"Speak!" he said.

"Speak!" quavered Fortin.

Durand waited a moment, then with a sudden upward movement he stripped off the mask and threw back the man's head. We were looking into the eye sockets of a skull. Durand stood rigid; the skeleton burst out from its rotting robes and collapsed on the ground before us. From between the staring ribs and the grinning teeth spurted a torrent of black blood, showering and shrinking grasses; then the thing shuddered, and fell over into the black ooze of the bog. Little bubbles of iridescent air appeared from the mud; the bones were slowly engulfed, and, as the last fragments sank out of sight, up from the depth and along the bank crept a creature, shiny, shivering, quivering its wings.

It was a death's-head moth.

I wish I had time to tell you how Lys outgrew superstitions—for she never knew the truth about the affair, and she never will know, since she has promised not to read this book. I wish I might tell you about the king and his coronation, and how the coronation robe fitted. I wish that I were able to write how Yvonne and Her-

bert Stuart rode to a boar hunt in Quimperle, and how the hounds raced the quarry right through the town, overturning three gendarmes, the notary, and an old woman. But I am becoming garrulous, and Lys is calling me to come and hear the king say that he is sleepy. And his Highness shall not be kept waiting.

THE RENAISSANCE: A EUROPEAN AWAKENING

CHAPTER I

THE END OF THE NIGHTMARE

Renaissance is the French word for Re-Birth. In its earliest use in history it referred to the revival in Italy of the ancient Roman architecture. Other countries had adopted the Gothic style, but the Italians preferred the purer lines of the old temples, whose stately remains still rose from the soil of their country to rebuke the barbarism of the new era.

Later historians, observing that it was not the pagan architecture alone that was reborn in the later Middle Ages, used the word Renaissance in a much broader sense. They meant by it the Re-Birth of Greek and Roman literature and ideals as well as art, chiefly in the fifteenth century. That is the proper meaning of the word, but modern writers give it a still wider significance. The Re-Birth of the classical spirit and literature was part of a very widespread "revival of intelligence, knowledge, refinement, and conscious mastery of life," so the Renaissance has come to mean the Re-Birth of Civilization out of the dark womb of the Middle Ages. It means to modern historians the entire transition from the Middle Age to the Modern Age, the Awakening.

This division of the Christian Era into Classic Age, Middle (or Dark) Age, and Modern Age does not flatter Christianity. It suggests that civilization was suspended during the long period between the death and the resurrection of paganism: that Christendom was coarse, brutal, and ignorant until the spirit of Greece and Rome restored it to some sense of dignity and humanity. And as our literature of general information is now largely written by anonymous priests and by literary men who would close like oysters if you asked them merely in what century Charlemagne lived, some singular ideas about the Renaissance are in circulation. In unexpected places you get smiling assurances that the "old history" was quite wrong: that now the splendor of the Catholic Middle Age is fully recognized, and the "tinsel" of the Renaissance is estimated at its true value. A Catholic writer (not an historian, of course) who was entrusted with the Renaissance in a recent series of manuals for the general public wonders, with the grave air of a Michelet or a Gibbon, whether it did not do more harm than good!

Unfortunately, historical writers often use language which these propagandists can quote. On the specious plea that history, like art, must be neutral, we find extraordinary concessions made to a false version of human events. Moreover, modern history is so specialized that it can hardly realize its own aim of taking broad views. No recent work on the Renaissance is equal even in historical truth, to say nothing

of the appalling contrast in literary quality, to the superb study, written fifty years ago, by John Addington Symonds, *The Renaissance in Italy*, and none approaches Jacob Burckhardt's *Civilization of the Renaissance in Italy* in detailed knowledge of the period. No one today, however, can find leisure to read a seven-volume work, like that of Symonds, and in a sense his beautiful and true study of the spirit of the Renaissance requires a correction. The blaze of his period so fills his eyes that all the previous history of Europe seems to him uniformly dark.

The finest recent study ought to be the first volume of the *Cambridge Modern History*, which is entitled *The Renaissance*. Unfortunately, it is not an analysis of the Renaissance and its meaning, but mainly a chronicle of the wars and other familiar "historical events" which occurred during the fifteenth and sixteenth centuries; and its deliberate concessions to possible Roman Catholic readers, by inviting men like Canon W. Barry to contribute, make it in some degree historically false. Mr. S. Dark's recent *Story of the Renaissance* is similarly a piece of Catholic propaganda and is unreliable. The last edition of Professor W. H. Hudson's *Story of the Renaissance* (1924) is still the best manual of moderate dimensions.

Here we take the Renaissance as a stage in the evolution of Christendom, and a most important stage. What every thoughtful person wants to know is, not what antics the French kings played in Naples, but what is the religious

meaning of this fact, now endorsed by all historians, that civilization, or a higher civilization, was not reborn in Europe until a thousand years after the adoption of Christianity: what is the exact relation of the Christian creed or Church to the previous barbarism and the later revival.

Academic historians often evade this unpleasant issue by gibing at "popular writers" who describe Europe as sunk in barbaric sloth until the revival of Greek literature in the fifteenth century, which is the main period of the Renaissance. Symonds thinks that the period proper is 1450 to 1500; others take the whole fifteenth century; and others—most recent writers—a period of two or three centuries. It depends on the precise sense in which you take the word Renaissance, and it is well to remember that it has two definite meanings—the revival of classical literature and the revival of civilization.

Now it is an essential part of my program that the awakening began long before the fifteenth century. After a few centuries of barbarism Europe was constantly endeavoring to rouse itself from its torpor, but—this is what the academic historians will not clearly say—the Church murderously suppressed every attempt. Bogomils, Cathari, Albigensians, Patarenes, Lollards, Hussites, and Luciferists (witches), representing millions of heretics, are just symptoms of the very widespread effort of Christendom, from the tenth century onward, to civilize itself in spite of Christianity; and

the successful secularization of architecture, sculpture, painting, teaching, law, etc., is another symptom. Let me, as we are now passing from the Middle Ages to modern times, give a further and final illustration.

Historical writers who diplomatically, and with fatal effect, borrow a phrase or two from "Catholic historians" speak of the Gilds as "inspired by the Church" (they were of pagan origin and the Church fought them for a century), the schools and philanthropy of the monasteries (which were generally colonies of sensual and slothful parasites, who rarely had schools even for themselves), the wonderful art of the twelfth and thirteenth centuries (which became wonderful only when it was secularized), and Dante.

I doubt whether any of these Catholic writers who enthuse about Dante ever read him. The third part of the *Divine Comedy* is, as Goethe bluntly said, "insipid." It is precisely a proof that pure Christian doctrine cannot inspire poetry. The other two parts are made interesting—Goethe says "repulsive"—by their material setting, but they are absolutely heretical from the Catholic point of view.

Read Canto IV of the *Inferno*. Before entering hell proper, Dante comes to a "noble castle," with a charming "meadow of fresh verdure," and finds a number of "great spirits" leading a life of ghostly dignity and tranquillity in this desirable home. Their only punishment is that they are not allowed the "Beatific Vision" (of God) which makes up the bliss of Paradise.

(And from Dante's description of this in his third book, I should say that they must have been profoundly grateful for the exclusion from heaven, for an eternity of such bliss, with no throat to cut, is a lot to which I would not condemn even Innocent III or Anthony Comstock.) These "great spirits," whom Dante honors with all his art, are the great pagans of Greece and Rome, the Moorish thinkers Avicenna and Averroes, and even Saladin, the deadly foe of Christianity!

In the next Canto, which describes the first circle of hell, with the very lightest punishments of that divine invention, Dante puts Semiramis and Cleopatra, Dido and Francesca, and all the prettier women known to history who lived in what the theologian calls the deadliest of sins, impurity. Throughout his *Inferno* and *Purgatorio* Dante classifies sins and sinners, not according to Christian teaching, but according to the social moral standard of Cicero and Aristotle.

And the meaning of this bold heresy of "the great Catholic poet" can be gathered from Canto X. It describes the quarter of hell, and by no means the worst quarter, where dwell "Epicurus and all his followers, who make the soul die with the body." Amongst these Dante puts the greatest monarch of the thirteenth century, Frederic II, the famous Cardinal Negli Ubaldini, and "more than a thousand" other Italians of his time! In this glorious thirteenth century, in other words, Florence was, in spite of the Inquisition, a hotbed of

radical skepticism. Indeed, there is very strong reason to believe that Pope Boniface VIII, who crowns the century, was an utter skeptic.

Let us now go back to the early part of the century, when Pope Innocent III inaugurated the practice of murdering people who would not profess to believe what they did not believe.

We read that in the opening years of his reign Innocent had to fly from Rome, driven out of his city by anti-clerical democrats. We follow the clue and learn that in the twelfth century a fiery and noble-minded ex-monk, Arnold of Brescia, induced the Romans to throw off the authority of corrupt priests and establish the first Republic in the world since pagan days. He was, of course, hanged for this vile transgression of the ethic of Christ; yet fifty years later the democrats of Rome were still strong enough to make the aristocratic Innocent fly for his life. And I presume you never even heard of that splendid little man, Arnold of Brescia, or of the democratic movement in the heart of Christendom nearly four centuries before the time of Luther.

We may, in fact, divide "the Christian Era" into four parts. I may use round numbers, as they are near enough to the facts to justify me in thus simplifying the history of Christendom. The first section (1 to 500 A.D.) was not a Christian Era; during three fourths of it Christians were a small and despised minority, and they won the majority only by the use of force. The next five hundred years (500 to 1000) were the Nightmare: not even the most ingenious

historian of our time who wishes to distinguish himself by correcting his predecessors has attempted to lighten the darkness and mitigate the horrors of that real and only Christian Era. The next five hundred years (1000 to 1500) are the Awakening. To our positive knowledge hundreds of thousands, and probably millions, had to be killed by the Church to prevent Europe from rejecting its tyranny. And the period 1500-2000 is the Dawn. It opens with the destruction of one-half of the Papal dominion; it sees irreligion broadening and deepening in each century; it already finds the Christian majority turned into a minority in every great civilization; its close will see the end of Christianity.

Surely I amply prove the first and second of these statements in other volumes, and I give half the evidence for the third. Christendom awoke, first, because a nation or a race does not, any more than an individual, sleep forever. One must not suppose that the terrible reaction from the fifth to the twelfth century is without parallel in history. Egypt twice fell into some such confusion, though apparently not to such a depth of degradation, in the course of its long history. China and India and Persia have similar periods. They awoke by the action of their own political and economic forces. Men find that order is preferable to disorder, wealth is preferable to poverty, security of life and property is better than lawlessness. The economic vitality of Europe again gathered in the condensations which we call towns.

Wealth made for art and refinement, and a class of lay artists, teachers, and writers arose, who wrested what was called art and learning from the monks and raised them to higher level.

Secondly, there was a very material awakening force which hardly any writer on the Renaissance properly appreciates; the stimulation of the Moorish civilization. The fact that Dante mentions with honor Avicenna and Averroes does lead some historians to remark, in a footnote, that there *was* a civilization in Spain; but few seem to be aware that when he mentions Homer, all the Greek philosophers from Thales to Zeno, Euclid and Ptolemaeus, Galen and Hippocrates, he is borrowing from the Mohammedans. No one in his time in Italy knew Greek or had Greek books, as we shall see. The group of skeptical scholars in Florence to which Dante at first belonged, and whose influence he never entirely escaped, owed their culture to the Mohammedans of southern Italy or of Spain.

The third awakening factor was the influence of Greek and Roman literature, which we consider in this book. These are the three fundamental influences in the Re-Birth of civilization, and the other causes assigned are either effects of them or are of little importance.

The Crusades are often vaguely quoted as having contributed to the civilization of Europe, since they enabled the boorish Christian knights to see what civilization really was, in the refined Mohammedan world. But the influence of this hostile clash was trivial compared with

the peaceful penetration of Europe by the Moors and Jews. One does not learn much on a battlefield except how to fight.

The astronomical revolution, the discovery that the sun is the center of the solar system, is given as a factor by all writers. It is one of the three causes of the Renaissance given by Professor Hudson; the others are printing and the discovery of new lands overseas. These two events, which we will consider later, are rather parts of the general awakening, or effects of the deeper causes I have assigned. As to the "Copernican Revolution," the effect of which modern writers fancifully exaggerate, it had no share whatever in the Italian Renaissance (which is regarded as ending in 1500 or 1520) and little elsewhere. The work of Copernicus did not appear until 1543, and its contents were known to very few until the days of Kepler and Galileo. Europe was then awake.

Much stress is laid also on the decay of the idea of a universal Empire and a universal Church. Symonds thought that this lifted a burden of despotism from the minds of men and fostered the spirit of initiative and independence. It sounds rather fanciful. The classic revival would favor the idea of a universal empire; and certainly the monarchs of France, England, Spain, etc., were as despotic as the Emperors had been. As to the idea of a universal Church, there had been wide revolts against it ever since the tenth century, but there were less in the fifteenth century than before. The Inquisition seemed to have triumphed. It was

the corruption rather than the tyranny of the Church that stirred men.

If we admitted any fourth fundamental cause of the Renaissance, it should be the realization of the corruption of the Church. It fired Humanists like Petrarch and Erasmus as much as it fired Luther and Melanchthon. It was the deepest and most persistent cause of revolt. But the Renaissance was a rebellion of a very special kind. It is not in the same line of evolution with the big democratic movements of the Bogomils, Albigensians, Lollards, Hussites, and Protestants. It was sensual, aristocratic, and scholarly; they were ascetic, democratic, and simple. Its standard was the pagan ideal; theirs was, generally, the Bible. The Renaissance was the beginning of modern times, if we think especially of the modern spirit; the Reformation, taking men back to Christ and the Bible, essentially rebuked it, and postponed its development, as we shall see.

It was a great half-century, that culminating period of the Renaissance, from 1450 to 1500. Every step in advance made the way easier, and put pride and joy into the heart of the wayfarer. Printing and paper gave a marvelous opportunity to the new ambition to spread knowledge. I do not compare it with the nineteenth century—I repeat that in the nineteenth century the world saw more progress than it had ever before seen in a thousand years—because science was too feeble to advance much, and because the Renaissance did little directly for the mass of the race. Ninety percent of

the people of Europe remained illiterate, miserably poor, practically serfs. Catholic writers who point out this, and charge the Renaissance with artistocratic selfishness, have no sense of humor. *Their church* had made ninety percent of the people so ignorant and coarse. The Renaissance, which would in time have helped them (it greatly enlarged the artisan class)—was checked by the old Church as well as the new or Lutheran Church. But it put a spirit into Europe, it gave a thirst for knowledge, it lit up a vision of science, which would never again perish. Our age is the son of the Renaissance.

CHAPTER II

THE CALL OF GREECE

Of the three fundamental causes of the awakening, I fully described the second, the inspiration of Mohammedan civilization, in Little Blue Book No. 1137. The first cause I assigned, the internal economic development of Europe, is a matter that would require a large volume. I have lightly sketched it, but most readers will understand it even without the historical details. The consolidation of the new monarchies and republics of Europe brought about a more settled, a more protected life. The population increased and got more out of the soil. Market centers became towns, then cities. By the time of the Renaissance Italy had cities of a hundred thousand to two hundred thousand people. Cities meant wealth, leisure, thinking, luxury, art. Regular international relations promoted travel and commerce. The artisan class and the middle class greatly increased.

And when we remember that during all this time, from the ninth century onward, travelers were bringing into Christendom stories of the high culture and prosperity of Spain, we realize that Europe was bound to return to a fair level of civilization. Then occurred what we call the Renaissance in the stricter sense, the revival of classical literature, and it had a most important influence.

Europe had almost no Greek works and only an imperfect collection of the Latin classics. Catholic writers now remind us how (for reasons of Church policy) the Council of Vienne had in 1311 ordered the teaching of Greek and how this or that scholar of the Middle Ages knew Greek. As Sir R. Jebb says, "Several scholars" in the course of "several centuries" knew a little Greek—a fine record, surely—and not a single teacher was appointed after the Council of Vienne. No priest could read the New Testament in Greek. It was a dead language. Religious bitterness had raised an insuperable barrier between eastern and western Christendom. Even the Latin classics had so fallen into obscurity that the Humanists, as we call the scholars of the Renaissance, had infinite trouble in making collections of them.

Petrarch (1304-1374) is regarded as the first Humanist. The English poet, Chaucer is often said to have been the morning star of Humanism, but the word is then taken in a broader sense. Petrarch is counted as the founder of the classical Renaissance.

However, there was a good deal of Humanism in Italy before the time of Petrarch, and his zeal for the classics was a direct outcome of it. Frederic II had done everything in his power to foster the intellectual revival. From his youth, when Pope Innocent III had been his guardian and had taken shameless advantage of his position, Frederic had learned to despise the Church; and he had later appreciated the far higher civilization

of the Saracens. Through his influence Florence and the other growing cities of Italy had begun to treasure lay culture and independent thinking, and had acquired the veneration of paganism that is reflected in Dante.

For men, the moment they began to reflect, saw three things: the degradation of Christendom, the corruption of the Church, and (if they had any learning) the superiority of Greece and Rome. Indeed, we must not forget that the really religious popes, bishops, and monks did more harm than the corrupt majority. Gregory VII and Innocent III did incalculable injury to human interests; and the more pious monks were the men who thrust the classics out of sight and kept art and literature in swaddling clothes. The truculent austerity of the good Christians was as irksome as the hypocrisy of the others.

What really characterizes the new movement, from the thirteenth century onward is the scorn of hypocrisy. Modern pagan writers on the Renaissance, like Symonds and Pater, describe with equal elegance and feeling, how the Renaissance was an assertion of man's right to beauty and love. Catholic writers entirely agree in this—though, boasting of medieval art, as they do, they would rather say sensuality and love—and they appeal to the puritanism of modern times to see in the Renaissance only an outburst of immorality. Both are right—and wrong. Symonds never quite explains how this assertion of the right to beauty and love was related to men's religious belief; and the Catholic never explains how

it was that his religion rose to its greatest height in the thirteenth century (he says), only to be followed at once by the license of the Renaissance.

Small as these little sketches in the Little Blue Books are, they show the true course of events. There was a continuous intellectual revolt against the Christian religion long before the Renaissance, and there was a revolt of the heart, an assertion of the right to beauty and love, all the time since the fourth century. All through its history Christendom was generally and profoundly immoral. The difference was that in the earlier period the taste was coarser and the right to love was not regarded as an admitted right, but an encroachment on God's rights. Old-age or death-bed repentance or clerical incantations would put matters straight. It was a stupid frame of mind, the result of forcing upon human nature a creed which was really unnatural.

With the growth of intellectual life men became clearer-headed. We must remember always that we are speaking of a minority—the few who could read. All through these changes which fascinate the historian—the triumph of Christianity in the fourth century, the Renaissance, the Reformation, etc.—the overwhelming mass of the people remained unchanged. The names in their prayers changed, that was all. But the thoughtful minority began to conceive God much like H. G. Wells conceives his Invisible King: he was not interested in small matters like love affairs. The Church, with its massive and general hypocrisy in regard to

sex, was evidently a human business. The laity felt itself free; free to paint the human figure in all its fleshiness, as Giotto did; free to depict human joviality as it was, as Rabelais did; free to love, as people had hitherto illicitly done. It is absurd to say that there was a growth of immorality after the revival of Greek literature. It had no margin for growth. Now, however, in cultivated men, it was a deliberate act, on principle, and therefore not immoral.

Let me complete this important aspect of the spirit of the Renaissance by a glance at the Papacy. I deal with its tenth-century degradation in another book (*The Dark Ages*, Little Blue Book No. 1130), and I will deal with its fifteenth-century degradation in the next chapter. But it must not be imagined that from the eleventh to the fifteenth century it kept a high character.

The century and a half of almost continuous blackguardism (890 to 1045 A. D.) was followed by a puritan reaction, led by Hildebrand; but this Pope's policy was such that after his death there ensued a century of such Papal grossness and violence that the churches of Rome were over and over again splashed with clerical blood. Then came Innocent III, and he in turn was followed by a turbulent period. Boniface VIII, the Pope who crowned the beautiful thirteenth century, is accused by a crowd of Roman clerical witnesses of natural and unnatural vice and every variety of corruption. After his death in 1304, the Popes lived at Avignon for seventy years, and their

court was described by Petrarch as "a sink of iniquity." They returned to Rome in 1376, and in 1415 the Council of Constance had to find Pope John XXIII guilty of "adultery, murder, spoliation, rape and theft." Yet immediately afterwards began the long line of corrupt Popes of the Renaissance, as we shall see.

Petrarch, the first of the Humanists, was the son of a Florentine lawyer who seems to have belonged to the cultivated circle which venerated pagan Rome. He had manuscript works of the old Latin writers, and Petrarch was reared in a high regard for these. After a time he settled near Avignon, where the Papal court then was, and the sordid hypocrisy of its puritan creed and open vices—unnatural vice was common amongst the clerics, from the cardinals downward, though women were as numerous as pages—intensified his veneration for Cicero. The Roman orator's sober and reasoned work *On Duty* (the chief moral authority used by Dante) gave a plainer map of life than did this ecclesiastical organization that lived by "the fable of Jesus Christ" (as a later Pope said) and outraged every letter of his teaching. Petrarch searched everywhere for and got other men to seek, more fragments of the old Latin literature. He was a Christian and in orders, but he was clearly very independent of the actual teaching of the Church. It was too obviously human.

The Romans, Petrarch soon found, had candidly represented the Greeks as far greater thinkers than themselves, and he turned to

Greece. The story of those days is a singular commentary on the worn legend, which one still finds in magazines and books, that the monks preserved the classics. When the Humanists began, there was very little even of Latin literature on the market. They had to spend whole lives traveling from town to town, and monastery to monastery, sifting the rubbish to find manuscript copies of the old Roman writers. Greek was a dead language in Europe, and scarcely anybody could have read or copied a Greek manuscript. Petrarch learned a little Greek from an Italian who had been some years in Greece, but there was no such thing as a grammar or dictionary, and he could never read the language.

Contemporary with Petrarch was his friend Boccaccio (1313-1375), author of the *Decameron*: a serious scholar who was much prouder of his learned works than of his stories. At the instigation of Petrarch he took up the study of Greek and even made a bad translation of Homer. Rich merchants were interested. The ambition arose to have collections of manuscript books. What we call "the Greek spirit" was discussed in literary gatherings, and to those men and women of the Middle Ages, living in a world of weird speculation and peculiar dogmas, it seemed as new and characteristic as Omar Khayyam seemed to moderns when he was first translated.

The Humanists recognized that the Greek spirit was the guide they needed. The real history of Judaism and early Christianity was quite unknown in those days, but educated

men *felt* that there was something wrong in the account which the Church gave of itself and its authority. The Greeks gave them a sane and balanced creed. Strictly speaking, there is no single Greek spirit. The spirit of Plato is not the spirit of Aristotle; the spirit of the Stoics is so different from that of the Epicureans that the rivals fought bitterly. But there is the common element that they all speculate in complete independence of religious traditions. They make man his own oracle and legislator. They exalt human nature and natural law. They reflect a civilization in which there was a general cultivation of beauty and wisdom; a glorification of the human body in art, of nature in poetry, of the intellect in science and philosophy. This was just the note for awakening Christendom. Human nature felt that it had been oppressed and exploited. The Greeks gave it its Magna Charta, formulated its Rights of Man.

But we must be careful not to exaggerate. Down to the end of the fourteenth century and long after, only a few hundred people were involved in this new Humanism, whereas the Lollards, Hussites and Witches (or Luciferists) must have numbered well over a million. Very few people could read, and so rebellion generally took the form of an appeal to the Gospels against the usurped authority and corruption of the Church.

I am not going to complicate this simple sketch by giving all the names and dates of the Humanists. In short, the living Greeks before the end of the fourteenth century dis-

covered this new zeal for their old literature and began to encourage it and profit by it. A well educated Greek, Manuel Chrysoloras, came to Italy on a diplomatic mission in 1391, and the cultured group at Florence prevailed on him to stay there and teach Greek. He wrote the first Greek grammar. Other Greeks now came over to earn a living by teaching, and chairs were set up in all the leading cities of Italy. Italians went to Constantinople, to learn the language at its source. The Turks were now pressing the Greeks very hard, and it was discovered that the fact that the Western Christians were a little heretical as regards the procession of the Holy Ghost did not really matter so much—now that the Greek Empire was in danger. Traffic across the Adriatic increased, and the zeal for Greek spread into Italy. It is related of Guarino, one of the Humanists, that, when his precious Greek manuscripts were lost in a shipwreck on his way back from Constantinople, his hair turned white in a day.

This was the great age of the Medici family at Florence, and the wealth which the bankers had accumulated, and the social and political power which the family acquired, were used on behalf of the new culture. Greek tutors were engaged for the Medici boys. Zeal for classical culture opened the door of the palace more easily than wealth or piety. Florence was becoming the wonderful city, the new Athens, which is so frequently described in George Eliot's *Romola*. The *Cambridge Modern History* makes the point which is worth

noting, that Florence was not at all a city of vice. It was noted for its general sobriety and its disgust with the corruption of Rome. Other cities—Genoa, Venice, Mantua, Ferrara, etc., followed the lead of princely Florence. Even Rome—always the last to join in a cultural development—had to adopt the fashion.

It was also the great age of art, which had a separate and earlier development. Architecture and sculpture had reached their height, and painting was in the first stage of its new evolution. Independently of any literary influence, laymen had taken over architecture and sculpture from the monks, and had by their soaring structures helped to educate Europe in a sense of beauty. This helped the new feeling for culture, and the revival of the classical standards reacted on painting and lifted it to its highest level, as we shall see in a later chapter.

But it was an historical accident which did most to promote the classical Renaissance. As I have said, the Greeks were relenting in their attitude toward the heretics of Rome because they wanted help against the Turks. The aggression of the Mongols had driven the Turks from western Asia into Mesopotamia, and they turned Mohammedan and joined the Arabs. We have here one more instance of the utter falseness of the Christian plea that *no* agency could have civilized the Teutonic tribes in less time—six or seven centuries—than the Church took to civilize them. Like the Arabs in the days of Mohammed the early Turks were not a whit higher in culture than the Teutons had been,

yet, again like the Arabs, they were fully civilized within about a century; not by any religion, but by contact with the older civilization. They steadily encroached upon the Greek or Byzantine Empire, and in 1543 they took Constantinople. Then it was, especially, that Greek scholars swarmed to Italy, with manuscript copies of the old Greek classics in their trunks.

One may wonder—indeed, it is remarkable how few historical writers do wonder—why this Greek literature which they brought to Europe had not proved a greater inspiration to themselves. By the middle of the fourteenth century, hardly a hundred years since the first Turks had pitched their rude tents in Mesopotamia, the Turkish Mohammedan civilization was so superior, not only to the Latin Christian, but to the Greek Christian, that numbers of Greeks fled to it and embraced Islam. The Turkish corruption with which we are more familiar belongs to later centuries of Ottoman history. In the fourteenth and fifteenth centuries the Turkish government or administration was one of the purest in the world, and art and letters were brilliantly cultivated; whereas the Greek Empire was, as I have shown in my *Empresses of Constantinople*, corrupt, degenerate, vicious, and—in spite of its very conventional art and decorativeness—coarse and brutal.

I do not see how any historian can avoid the conclusion that the responsibility lies with the creed of the Greeks. It may have inspired

many self-tormenting saints, as it did in Europe, on the principle that forty years repression or starvation of their sex-impulses would be rewarded with an eternity of bliss. I am, I fear, obtuse to that kind of superiority. It may have insured a safe passage through the gates of heaven for millions: a matter on which I do not care to speculate. But its entire and lamentable failure to sustain a civilization is as obvious in the east as its failure to inspire a civilization is in the west. Not the German barbarism, but the creed imposed upon them, ruined Europe.

But these works which the Greek refugees brought to Italy, and helped to make known to Europe, entered a new world. One thinks of the seed stored in Egyptian tombs for millenia; or one would recall that fact if it were true that the seed will germinate if we plant it today. The Greek ideals were not dead. They had but lain for a thousand years in a living tomb. They were brought to Europe when the corruption of the Papal Church was at its height, and men were therefore prepared to consider other standards of life. They were brought to a race which had for a century or two been pushing, half consciously, in the direction of the Greek idea of life. That feeling was really anti-Christian, and we have to see how it was that no thunders from the Vatican fell upon the ears of the Humanists, and why so few of them were requested to explain their philosophy of life to the Inquisition.

CHAPTER III

THE PAPACY AND THE RENAISSANCE

A type of letter often reaches me, a type of Christian often approaches me, with the reproach that I do not distinguish between the teaching of Christ and the teaching and conduct of the Churches. It amuses me to hear that I have "overlooked" this platitudinous distinction; that I still think of all religion as of the peculiar Roman Catholic variety; or that at least I have a "tough complex" which makes me honestly incapable of appreciating the theological refinements of our own age.

Seeing that the first half dozen books of this series deal, not with Catholicism, or even with Christianity, but with religion, including even the most ethereal and most modern shapes of it, the reproach is humorous. It will be found, when my program is considered as a whole, that not much of real interest in connection with religion or Christianity has been "overlooked"; and it must be realized at once that precisely in the present section of my work I am, while anxious to give a positive reconstruction of the real development, criticizing the teaching of Jesus, as far as we know it, as well as the Church. No man is a Christian because he believes in the same ethic as Jesus. He might as well call himself a Stoic,

an Epicurean, a Buddhist, a Platonist, a Confucian, or a Mohammedan. The teaching of Jesus is essentially a message about a supposed next world. Jesus cared not one cent about civilizing forces; he blighted life with an unnatural asceticism; he was as emphatic that we should not love woman as he was that we should love men; he had an entirely false conception of moral conduct and gave an entirely false motive for it.

The pure teaching of Jesus would never have engendered the art and refinement, the science and knowledge, the organization and productiveness and concern for earthly welfare which lift us, in comfort and character, high above the Middle Ages. The men of the Middle Ages who were most true to the spirit and letter of the teaching of Jesus were the most indifferent to the advance of civilization. Those who did contribute to it were to that extent faithless to his teaching. And one of the strongest proofs of this lies in what we are now about to see of the Popes of the Renaissance period.

The Popes, as I said, were living luxuriously, and some of them immorally, in Avignon when Petrarch began the classical revival. Read his letters, and you will realize that it was in large part the spectacle of ignorant Christendom exploited to pay for the vices and luxuries of the Papal court at Avignon which made Petrarch turn with affection and regard to the old pagan world reflected in the classical literature. Petrarch loved when he listed, not when priests permitted it, yet the sight of Avignon, near which he then lived, in its Papal

days makes him write as if he were a Marcus Aurelius.

During the seventy years' absence of the Pope at Avignon, which was due entirely to bribery and political influence, Rome sank rapidly in culture and importance. The grass grew on its streets. We have seen that it had never taken the lead in any cultural advance, and now the opulent cities of northern Italy regarded it with disdain. There was a serious danger of Italy disavowing the Papacy, and with much trouble the Popes were at length induced to return to Rome. A Neapolitan monk, of fiery speech, was made Pope, and, when he told the cardinals what he thought of their morals, they elected an Anti-Pope; and the cardinals sought the life of the Pope, and the Pope had six of them lowered into a deep well and almost murdered.

So the strange spectacle was prolonged from age to age—the heart of Christendom sinking lower and lower as the rest of Christendom rose in civilization—until at last the whole Church was outraged to learn, from the great Council of Constance, that the man who had ruled it for five years under the name of John XXIII was an ex-brigand of boundless sensuality, entirely destitute of religious or moral sentiments. Rome was by this time the butt of popular songsters all over Europe. The best elements in the Church united in a demand that the Roman masquerade should cease, and the Church should be governed by Councils.

It will thus be understood why up to this stage the Papacy had taken no interest in the

new cultural movement. Three decent Popes—Rome's abominable financial scheme—then ruled the Church for a few decades, and the third of them, Nicholas V, was a man of some cultivation. He opened Rome to the classical revival. He began the adornment of the city with beautiful buildings.

It is now the fashion for Catholic writers to tell how the Church applauded the Renaissance and sought to direct the zeal for knowledge without infidelity and for beauty without license. Let us remind them that it was not until 1450—a century or more after the rest of Europe—that the Papacy began to show any concern for letters or art though its wealth, the sources of which I will describe presently, was enormous. Let us remind them also that Rome, with its glorious ancient monuments, was the natural home for the Renaissance, yet it was not until 1462 that any Pope forbade builders to strip the marble linings off the old buildings to make lime and use the precious stones to make the miserable dwellings of the medieval Romans.

And, when it is boasted that Pope Nicholas V vied with the Humanists in a zeal for letters, let us recall that at his death in 1455 his collection consisted of only 1,176 manuscript books, mostly ecclesiastical literature, and that in 1484 the Vatican Library, "the most important library in the west in the fifteenth century" (an apologist in the *Cambridge Modern History* proudly says), had only about two thousand books. Six centuries earlier the Moorish ruler in Spain, Al Hakim, had had a library of

more than half a million books, and hundreds of his subjects, with not one-tenth the income of the Popes, would have regarded the Papal collection with disdain.

Nicholas V made a beginning, and it was quite time. That is the germ of historical truth in all the glorification of him by writers on "the Catholic Renaissance." Granted, you may say, but why cavil about these humble beginnings? Within a hundred years Rome became the most beautiful city in the world and had the greatest school of painters, sculptors, and architects in the world. A long line of Popes used all the resources of the Renaissance to embellish the center of Christendom.

I am meeting questions which occur to every thoughtful person and the answer to which is generally shirked by academic historians. And the question here is: What relation had this late artistic splendor in Rome, this patronage of the Renaissance by the Popes, to the Christian creed? The answer is: None. Of the inspiration of the artists I will speak in the next chapter, but about the Papal patrons of the art there is now no controversy. The most learned Catholic historian of the Papacy, Dr. Pastor, is in line with all other historians. The Papal court had passed into a new phase of degradation, and, the less religious the Popes were, the more they patronized art.

Since the cardinals elect the Pope, it is upon these that the moral health of the Papacy depends, and for two hundred years the cardinals were, as a body, appallingly corrupt. At every

election they fought, with gold and hired assassins, for the great prize, since the income of the Papacy was now stupendous, and the successful candidate was forced to make new cardinals of totally unworthy supporters, or chose to make cardinals of equally unworthy relatives. When the Popes were not corrupt, they were Nepotists, promoting and enriching their relatives irrespective of character. The result was that during the period of what is called the Catholic Renaissance the Papal court had a degradation which differed from that of the tenth century only in being refined and perfumed and clad in silk. I have given the details in my *Crises in the History of the Papacy* and *Popes and Their Church*, but the whole of them may be read, or discovered by the diligent inquirer, in the very extensive Catholic history of Dr. L. Pastor (*The History of the Popes*).

At the death of Nicholas V the rival cardinals fought until there was a deadlock, and a pious old Spaniard, the first Borgia, got the prize. His piety, however, was quite consistent with his rapid promotion of his amorous nephew, Rodrigo Borgia, who at once began to exploit the venereal opportunities of his high clerical position. The next Pope, Pius II, was actually a Humanist, but he did next to nothing for letters. He was gouty and repentant, and he saw "the gates ajar" in front of him. The next Pope, Paul II, also was aged and inactive, and the stream of Roman life simply flowed on.

Then a Franciscian friar, Sixtus IV, be-

came Pope; and Catholic writers tell how the patronage of art and letters in Rome took a more generous turn. They do not tell how Sixtus IV at once promoted two nephews (some historians say natural sons) of his who were as unbridled as Rodrigo Borgia. Sixtus IV said his prayers while Cardinal Pietro Riario, his younger nephew, painted Rome red—very literally, for his gorgeous palace had five hundred servants in scarlet silk. His favorite paramour, Tiresia, wore two thousand dollars' worth of pearls on her slippers. Pietro, a raw provincial youth until the Holy Ghost descended upon his uncle, spent nearly a million dollars (worth many times that sum today) and died of vice and drink, under the shadow of the Vatican, within two years. The other nephew was sober by comparison. He was piling up his dollars to buy the Papacy—it now went to the greatest briber—and his one luxury was handsome women. His children were not disguised as nephews or his chief mistress as a secretary. This was the "great Pope" of the future, Julius II.

When Sixtus died, Rome was an armed camp. The cardinals had troops of the medieval equivalent of gunmen, and the bribery was opulent. But it was again a deadlock, and the tired Holy Ghost selected Innocent VIII. In the new fashion he at once sent for his natural son, Franceschetto, and this youth leaned much nearer to Nero than to Christ. Most of the cardinals kept their pages—unnatural vice was as common as natural—and their mistresses in their luxurious palaces, and their gambling, in which half a million dollars might be lost

in a night, was done in the light of their own lamps. But the palate for this kind of thing was becoming jaded in Rome, and the Pope's son wandered about at night, with his cut-throats, breaking into any house where a pretty maid or wife had been located.

The old Roman families, such as the Colonna and the Orsini, who regarded the Papacy as their proper heritage, had now to contend with three new broods: the Borgias, the Riarios, and the Cibos. All of them left it to a few old-fashioned cardinals to practice the old-fashioned virtues of chastity and sobriety, and for their advancement in the Sacred College relied on the new weapons, steel and gold. More than two hundred murders distinguished the Papal election of 1492, but Cardinal Borgia distributed amongst the voting cardinals gifts worth something like a million dollars and became the Holy Father. Rome gasped, and smiled.

We are now permitted to believe that there were "a few" bad Popes and a few others who had been "irregular" in their youth, but we are asked to admire how *rarely* Popes were immoral during their tenure of office. Is the world losing its sense of humor? This modern apologetic makes one wonder. In the first place, cardinals are not usually chosen to be Popes unless they are well advanced in years, and, on careful inquiry, these new apologists will learn that men advanced in years are, curiously, not so ardent in love as they had once been. In the next place, however, the Papal record is, in view of this highly moral arrangement, to say nothing of the light of the Holy Ghost and the very special inter-

est of Christ in his Church, quite picturesque. We really know nothing about the youth of the great majority of the Popes of the Middle Ages, but of those whose actions have been chronicled between 900 A. D. and 1500 A. D. twelve of the Popes were immoral (five of them in an unnatural way) during their term of office, and as many more had merely outburned their vices. For a series of generally old men, presiding over one of the most ascetic of creeds, it is certainly a gay calendar.

Alexander VI is by no means the worst of the Popes. Several Popes of the tenth century, as well as Boniface VIII and John XXIII, were much worse. But we happen to know him well, and even Catholic historians like Dr. Pastor now reproduce the birth-certificates of his six children.

In a sort of historical romance, *The Pope's Favorite*, I have given a detailed picture of Rome and the Vatican in the days of Alexander and his latest mistress, a beautiful girl of fifteen when he first seduced her. The element of fiction in that book is light. It is simply history clothed with flesh; and it is safe to say that no professedly religious establishment that the world has ever seen could compare for a moment with the Vatican Palace at that time. Alexander's philandering was all conducted in the "Sacred Palace." Not content with his lovely young mistress, and although he was nearing seventy years old, he had other women brought to him. In 1496, four years after his election, the sixty-seventh year of his age, the Pope begot a son; and in the same year a severed head was found on

a pole in Rome with the inscription: "This is the head of my father-in-law, who prostituted his daughter to the Pope." His favorite and dissolute son Juan was murdered, most probably by his brother Cesare, in the following year, yet as late as 1501, less than two years before his death, the veteran sensualist had orgies in the Vatican of so exotic a nature that my British publisher compelled me to curtail the description of one of them which I took from the highest possible authority, the Master of Ceremonies of the Vatican. The Pope and his son and daughter had fifty of the most beautiful prostitutes of Rome dancing naked before them. And the priest who wrote this down in the Vatican at the time concludes with the amazing statement that the Pope distributed prizes to those of his male servants who could demonstrate the greatest virility. I have read many descriptions of orgies, in many tongues, but his in the "Sacred Palace" is the most picturesque.

So the Popes did not discourage the Renaissance. That is the serious point of my again writing on these matters. Rome and the Vatican were drenched with what the Christian ethic calls corruption. Alexander's rival, Julius II, had to wait so long for the Papacy, that the days of his natural and unnatural vices were over. He was quite a proper Pope, a very great patron of art; but he swore like a stevedore, and his passions were only less elegant than the amorous excesses of his cardinal-cousin. Leo X followed him, and fully sustained the princely patronage of art; and he had the most grossly indecent comedies

enacted in the Vatican; he is said by the contemporary historian Guiccardini to have been, as Pope, "excessively devoted to pleasures which cannot be called decent" (he means unnatural vice), and was quite clearly devoid of any moral sentiment and most probably of religious sentiment or beliefs. Paul III closes the period of the "Catholic Renaissance"; and he had been made a cardinal because his sister was Alexander's mistress, and had had four children born in his palace.

Need one say more? You can read all this in Pastor, the Catholic historian. The poor man imagined that, when Leo X threw open the Secret Archives of the Vatican (after abstracting the compromising documents), and urged Catholic writers to "tell the truth," the Pope meant what he said. So he wrote a fairly (not entirely) candid history of the Popes of the Renaissance; and his Church has kept him in sackcloth and ashes, so to say, ever since. The whole story is, however, now well known. Rome was as conspicuous for "free love" during the Catholic Renaissance as Corinth or Antioch or Alexandria had ever been.

But to complete the story we must glance at the sources of the wealth with which the Popes built St. Peters, decorated the Vatican, and drew great artists from all sides to form a Roman School.

Here again there is no dispute. It was tainted money, if there ever was tainted money. The simony of Rome, the sale of sacred offices, shocked Christendom even more than its vices.

For two hundred years the system had grown of selling a clerical office with income before the holder died—selling it to various people, with “expectations” and “preferences”—and charging fees for every grace and permit that Rome had to issue. John XXII at the beginning of the fourteenth century, so organized and enlarged this traffic as to secure an acknowledged income of about a million dollars a year; and the brother of his banker tells us that he left sixty million dollars in gold and jewels, the far greater part of which never passed through his ledgers. We must not forget, moreover, that a dollar would then purchase many times as much as it now does.

But Pope after Pope extended the sordid traffic and discovered that “indulgences” could be gained just as easily by those who remained at home and paid to the Church the price of a journey to Rome as by those who made the actual pilgrimage; and since one was robbed all the way across Europe, and even in St. Peter’s, to say nothing of the loss of time and business, the easier way proved popular. It was like the discovery of the Californian or Alaskan gold-fields. The Popes sent agents out over Europe, and, unfurling the Papal banner in the churches, they shouted their wares with all the oratory of street-salesmen, and the gold flowed in streams to Rome. It is estimated that Leo X, who is generally named by Catholics as the greatest patron of the Renaissance, spent about two million dollars (ancient value) a year, and left enormous debts at his death. Nor was it, in his case, mere zeal for the prestige of Rome

that cost so much. "The splendor of the Leonine Age," says Dr. Pastor, "so often and so much belauded, is in many respects more apparent than real." He spent prodigious sums on luxuries for the Vatican palace, but neglected the Roman University, slighted Michelangelo, and did relatively little for sculpture and architecture. His tastes were in many respects gross, and his rooms and gardens stank with what his Church calls indecency!

St. Peter's, the Sistine Chapel, and the other memorials of the Catholic Renaissance are monuments of the corruption of the Papacy. For a season the great art of the Renaissance found a superb opportunity in Rome, precisely because the spirit of Christ was utterly forgotten in it for a season. Of the eight "Holy Fathers" who ruled the Church during that season, from 1484 to 1549, five were fathers in the carnal sense, and the other three reigned only twelve years collectively. All the time the atmosphere of the clerical world was one of extravagant luxury and every kind of vice, and the funds for it all were derived in ways in comparison with which the ways of the money-changers whom Jesus is said to have driven from the Temple were as innocent as the games of children.

CHAPTER IV

THE SPIRIT OF HUMANISM

The leading scholars of the Renaissance are generally described as the Humanists, and the latter word is, like the former, open to more than one interpretation. The poet Chaucer is often hailed by literary men as the first Humanist, though his Humanism had no relation to classical literature; and the philosopher William of Occam is hailed by philosophical writers as the first Humanist, though his work in turn was unaffected by Greek or Roman literature. In our own day a new meaning has been read into the word.

It is, in any case, an awkward term. Properly speaking, it ought to mean a concern about human affairs rather than divine. The Agnostic is the only real Humanist, and ours is the dawning age of Humanism, the inauguration of the kingdom of Man instead of the passing kingdom of God.

But the persistence with which the word has clung to the scholars of the Renaissance brings out a very important truth. Few of them rejected belief in God, but as a body they rejected the tyranny over life and culture exercised by the clergy in the name of God. They brought the world nearer to Humanism. Painters and sculptors demanded the use of living human models instead of the lifeless conventional figures which had hitherto been copied.

Literary men demanded that they should be allowed to tell stories and write poems or songs about common human life—be as free to describe a sin as the painter was to describe a limb—and not confine the pen to chronicles and hymns and lives of saints. Teachers insisted on the value of instruction about man and nature as well as about God. Philosophers determined to speculate freely about man and nature apart from revelation. The Renaissance was, as Michelet said, “the discovery of the world and of man,” but man was the more important of the two. Humanism is a note rather than a creed in the Renaissance.

But the note is skeptical and it is significant in world-history. It was a rebellion against the genuine teaching of the Christian creed. The interest, the inspiration, the high potentialities of man had been obscured by the miserable philosophy of human nature which priests imposed in the name of the Bible. If the race lay under a primitive curse, if all men had died in Adam, as Paul said, Paul’s attitude to human nature was correct. If Jesus was right that to look with desire at a beautiful woman was to be punished for all eternity, and that wealth was a very serious handicap to one’s hopes of heaven, the moral was clear.

Yet somehow, in the course of that long awakening that I have described, human nature was vindicating its worth in spite of the creed. Men felt that they had the high powers which priests denied. Unconsecrated men wrested in succession from the hands of priests and monks the arts and crafts of building, carving, paint-

ing, governing, making laws, teaching, thinking, writing, etc., and each rose to a much higher level. In a glorious burst of confidence, strengthened by the example of the Mohammedans, they tried their creativeness, and they found it as great in art as in industry. And the discovery of beauty, in woman or in nature, brought its usual sequel: the assertion of the right to love and to enjoy. It was the beginning of naturalism as a deliberate creed, and the beginning of the end of supernaturalism.

It is easy to see how the classical revival, which supervened upon this development, stimulated it. It was the human form that had inspired the world's greatest artists. It was in an age when men were proud of their human nature, and had no theology which overshadowed it, that man wrought his finest achievements. It was a little nation with the least tyrannical and most superficial of religions (as far as the men who *did* things were concerned) which gave us the finest philosophies, finest sculpture and architecture, finest tragedies, and finest ideals of corporate and individual life. Pride in human power is the real Humanism of the Renaissance.

It is usual to contrast Humanism and Scholasticism, the system of theological thought elaborated in the medieval schools which became the universities of Europe. As I have occasionally pointed out, some modern writers, partly to make a parade of liberality, partly to say something new, partly in a consciousness that a sixth of the reading public in America is Catholic, borrow phrases from Catholic writ-

ers. Scholasticism had been calumniated, they say; it was not a barren system of thought, discussing such things as how many angels can stand on the point of a needle. Let them try to read the Scholastics, as they have obviously not done. When I was a Catholic professor, I found that even my colleagues never read them. There is no living thought in them.

But Scholasticism is interesting on one side. Large numbers of French students went to work amongst the Moors in Spain, and it was impossible for men like Thomas Aquinas to ignore that a very high civilization smiled at his verbose deductions from Scripture and the Fathers. These Moorish philosophers, he found, swore by Aristotle; and just at that time Greek copies of Aristotle's works reached Paris. The Crusaders had gone out to meet the Saracens once more, and they had this time preferred the easier and more profitable task of taking and sacking Christian Constantinople (1204 A. D.). They brought home manuscript copies of Aristotle amongst their loot, and these were translated into Latin. Aristotle was henceforward used to give some substance to the frothy verbiage of the Schoolmen. Some (Roger Bacon, etc.) tried even to develop the germs of science buried in Aristotle's works, but the Church smelt sulphur at once and stamped out the danger.

The philosophical works brought to Italy in the fifteenth century were chiefly those of Plato and the Neo-Platonists. I cannot discuss here the contrast between Plato and Aristotle. One illustration must suffice. Plato used all

his art of rhetoric and reasoning to prove the personal immortality of the soul, and Aristotle rejected the belief. So, as the Humanists followed Plato, there was a very decided hostility to the professional or clerical teachers of theology and philosophy. The main point was, however, that Plato was used as a cover for free speculation, while the teachers in the universities were hidebound. The Church, naturally, watched this side of the Renaissance, and some, like Pomponazzi, were driven to say that a thing could be false in the light of reason and true in the light of religion.

Philosophy is, however, a subject too large for the limits of my space and, to say the truth, too small for my inclination. Let us pass to the other extreme and consider what influence the new spirit had on art.

Until well on in the fifteenth century the classical revival affected a relatively small number of people, whereas medieval art was then far advanced. Painting, however, lingered behind sculpture and architecture. It began its higher development, in Giotto, independently of classic literature, by the sheer artistic impulse to reproduce beauty as it actually was, in man and nature. Yet it had not reached its great days when the classical ideals began to be diffused in Italy, and the influence of the new spirit is then plain to the eye.

It will suffice here to consider for a moment the two supreme artists of the Roman school, if not of all Christendom, Michelangelo and Raphael. I have described the skeptical and

sensual atmosphere in which they worked, but one is constantly confronted with the claim that, as they were "profoundly religious" men, they found their mighty inspiration in their own piety in spite of the scurrilities of Popes and cardinals. I would not here express a personal opinion, and I have earlier quoted Symonds and various authorities on art. But it is interesting to see how Professor W. H. Hudson, who had a weight of authority behind his words, deals with these artists in his particularly valuable chapter on the art of the Renaissance.

He quotes the often-quoted saying of Michelangelo, that the painter of religious pictures must, if he is to succeed, be a good man, or "even a saint." The Catholic (forgetting the paintings of Pinturicchio, a very wicked man, or of Rubens, a very fleshy man) generally ends there. But Professor Hudson goes on to say that "no man did more than he [Michelangelo] to destroy the religious meaning of traditional Christian art." The great artist, he says, contributed mightily to the "secularization" of painting, sculpture, and architecture. He says in one of his sonnets that the highest manifestation of God is in "human forms sublime." And of his wonderful painting of the Last Judgment in the Sistine Chapel, to which the enthusiast will turn most eagerly for proof of religious inspiration, Professor Hudson observes that it is "difficult to detect the play of any distinctively Christian feeling," that "the last link connecting art with Christian tradition has been broken," and that "to

regard it as a Christian interpretation of a Christian theme is absurd" (pp. 205-6).

Raphael, on the other hand, he says, sometimes shows religious inspiration, but "more often he simply paints the most beautiful woman he can find as the representative of motherhood, without indicating, either by symbolism or by general tone and expression, the transcendental significance of his type" (p. 203). We saw that Murillo in his best work does the same, and it is the general truth about the Renaissance painters. Like Rubens, who loves to paint the luscious nude body of his mistress as Venus—there are three known copies of his "Venus and Adonis"—they painted figures from the ancient mythology and allegory just as beautifully as they represented the Madonna and the Bambino. Titian, the last great Italian painter, was a pure Humanist. Rembrandt shows art fully secularized. Dürer and Holbein seem to the expert to reflect the influence of Protestantism. In any case, the broad historical fact is that once Rome was purified of its paganism and sensuality, all great art ceased in it. Let the admirer of the "Catholic Renaissance" digest that.

In literature the spirit of Humanism did not wait for the classical revival, but it received a remarkable invigoration in the fifteenth and sixteenth centuries. Chaucer is decidedly a Humanist, and the entire body of troubadours and song and ballad makers of earlier centuries represents a determination to secularize music and poetry. By the fifteenth century many of these popular songs actually satirized

the vices of the clergy and the greed of the Vatican. Then came the new learning, and Italy soon had its Petrarch, Boccaccio, Ariosto, Tasso, Cellini, Machiavelli, etc.

A very distinctive effect of the classical Renaissance, and more particularly of the *Catholic* Renaissance, if we were to take that phrase seriously, was the revival of indecent comedy. The comedies of Plautus and Terentius are now cited by the apologist as one of the symptoms of the low moral tone of the pagan world, but he would be astonished if he took the trouble to ascertain how fond the Popes were of seeing them acted in the Vatican. In point of fact, they are much less gross than they are represented to be by the people who do not read them. I have a complete edition of the Latin Comedies of Plautus, and have read them all. The least delicate is the *Menaechmi*, and it was performed in the Vatican Palace before the end of the fifteenth century, and often repeated.

Such comedies proved so popular that a large number of imitations of them were composed, and Pope Leo X was one of their most ardent patrons. His intimate friend Cardinal Bibbiena (who had his bathroom frescoed as the bedroom walls of houses of love in Paris today) wrote some of the most lascivious, and Cardinal Cibo took leading parts in them. Ariosto, Machiavelli, and others contributed to this kind of literature, and it went all over Europe. Shakespeare's *Comedy of Errors* is directly inspired by the *Menaechmi* of Plautus.

Here the Renaissance found a material im-

plement of an importance that cannot be exaggerated: the printed book. Artless pictures of the monks of the Middle Ages copying and preserving the classics for us no longer move us when we know that Moorish rulers had libraries of half a million manuscript volumes, and when we read what infinite trouble the Humanists of Christendom had to get the classics together in the fifteenth century. Yet it was a revolutionary advance in the education of the world when paper and printing came into use. I am a quick writer, yet find eight thousand words—not of original composition, but of copying or translating—a day too severe a task to contemplate daily. A monk would take a lifetime to make, at the rate of one per week, a thousand copies of this little book. A machine spits them out at the rate of 5,000 copies or more an hour.

Paper had been introduced from China by the Mohammedans, and Christendom very slowly and reluctantly borrowed it from the Moors. Printing also should be traced back along the same route, for the Chinese had for ages been accustomed to block printing. In the middle of the fifteenth century, the turning point of the Renaissance, this led to the invention of printing by separate letter blocks, and before the end of the century there were twenty-two master printers in Cologne and a number in each of the German cities. By 1465 there was a press in Italy, five years later one in France, and in 1476 the Caxton Press was established in England.

Although printing was at first necessarily

very slow, there can be no doubt that the multiplication and cheapening of books would soon have led to an extension of culture to the more thoughtful workers if the normal course of events had not been broken by the Reformation. The works of Erasmus, in particular, were read far beyond the circle of the cultivated few. In the main, however, as we should expect at so early a date, the efforts of the Humanists were directed to the improvement of such education as already existed. Vittorino da Feltre and Guarino in Italy, Johann Sturm and W. Ratke in Germany, Comenius in Moravia, Roger Ascham in England, opened model schools, and forced the introduction of the "humanities" into education. Rabelais has many ideas for the reform of education in his extraordinary work, and Montaigne gave currency to them in a more respectable medium.

The effect of Humanism upon the study of science, which was at once seen in the work of Francis Bacon, is too important to be discussed in a few lines. Little Blue Book No. 1142 is devoted to the beginning of science and the facts about Bacon, Copernicus, and Galileo.

We must, however, note here that the critical spirit, which is the essence of science and of all discovery of truth, was at once aroused by the classical Renaissance. The Italian critic Lorenzo Valla, in fact, better deserves a place in the memory of our age than most of the monarchs and Popes of the Middle Ages. A fierce critic of Scholasticism, an avowed follower of Epicurus, he was the first man in Christendom to examine fearlessly the bases of

the Papal power and expose the forgeries. In 1440 he published a short study of the supposed Donation of Constantine which opened the eyes of many to the real character of the Papacy, and he was the first to apply criticism to the New Testament. Naturally, the Inquisition sought to make his acquaintance, and he earned the protection of the Popes by abjuring his wicked habit of telling the truth and devoting his genius to such innocent subjects as *Elegancies of the Latin Tongue*. A century later the power of the Vatican was shattered over half of Europe, and a complete edition of Valla's works helped to lay the foundation of modern critical history.

CHAPTER V

ERASMUS AND OTHER HUMANISTS

Geographical circumstances account for the original development of civilization, not in what we call the Great White Race, but in Crete, Egypt, and Mesopotamia. The same geographical circumstances explain the Re-Birth of civilization in Italy, as we have already explained. Germany had had its hour of hope under Charlemagne, and its period of achievement when it developed the Romanesque architecture. France had had a promising civilization, inspired by the Moors, in its southern provinces, had taken the lead in the revival of schools, and had given the world the Gothic architecture. But religious reaction and political vicissitudes had brought these efforts to an end, and it was the breathing of the spirit of the old world, through Moors and Byzantines, upon the nearest country, Italy, that effected the real and lasting awakening.

From Italy "the new learning" naturally passed at once to France, and as early as 1458 Greeks were teaching Greek in Paris University. The French, like the Spaniards and Rumanians, flatter themselves that they are a Latin nation—strange how persistently Christian nations have claimed affinity with the wicked old pagan civilization—and they had a temperamental inclination to a classical revival. In the south, moreover, they had, like

Italy, beautiful and impressive remains of Roman days. In point of historical fact, the Renaissance did not at once conquer France. Until the French invaded southern Italy in 1494 there was little effect of the revival except a group of students of Greek literature.

After 1500 the new spirit gained ground. From the court downward manners were refined, and from the university downward education was reformed. Men of great and real learning like Scaliger and Casaubon arose; Rabelais put his remarkable erudition and his skeptical and stimulating ideas in a form which appealed to the lingering grossness of Christian taste; and at length Montaigne (1532-92) formulated the new spirit with an elegance and sobriety of taste which commended it to all who could read. The great age of Richelieu and the Academy, of Molière (a complete skeptic), Racine, and Corneille soon followed, and prepared the way for Voltaire and Rousseau.

But Paris rendered one early service of which it thought nothing at the time. It taught Erasmus Greek. Erasmus, the man who "laid the egg which Luther hatched," did more than any other single Humanist to 'spread and deepen the influence' of the Renaissance. A traveler in Spain in 1527 found in almost every country inn in that reactionary land a translation of the *Encheiridion* (or moral treatise) of Erasmus. Another and bolder work of his, the *Colloquia*, was brought under the grave consideration of the Sorbonne at Paris, and it was expected that it would be condemned. A Paris printer hastily brought out and distributed an

edition of 24,000 copies of it; and this, even in our time, is a larger circulation than a serious work of any price could hope to attain. It is a measure of what the modern world owes to Erasmus, and should be carefully considered by those who, not living in the days of the Inquisition, lightly blame him for not joining the Reformers or even heading a pronounced Rationalist movement. His works were eagerly read all over Europe, and had a remarkable influence in spreading the critical and humanitarian spirit.

Desiderius Erasmus was a Dutchman, born in Rotterdam in 1467, the illegitimate son of a doctor's daughter. Gheraerd was his father's name, which he Latinized as Erasmus. He became a monk, for the convenience of his guardians, and had a wicked eye on monks ever afterwards. "They are called fathers," he says of the friars, "and they often are." He became a priest and went to study theology and Greek at Paris and in Italy. His wit and brilliant talent opened every door to him, but he migrated to England, where he gave powerful assistance to the little group of Humanists, and pointed the true moral of the new learning by publishing his *Encomium Moriae* (Praise of Folly), a mirror of the folly of Christendom in tolerating such priests and Popes as it had. For the last twenty years of his life he lived in southern Germany, where his works did much to prepare the way for the Reformation.

Known in four countries, indeed in the whole of civilized Europe, as the most brilliant man of his time, Erasmus had a thousand readers

for the reader of any other serious writer of the seventeenth century. And he did not hesitate to season his work with, not only his pungent wit, but passages which show how entirely free his mind was. His most effective work was his *Colloquia* (Conversations) a familiar and mirthful indictment of the religious comedy of Christendom. It is, says a recent writer, "a masterpiece," but "disfigured by lewd and unchaste passages." That was why Christians read it in their tens of thousands, and had their eyes opened. It was condemned by the Sorbonne, and burned in Spain, not for its "lewdness," but for its scorching exposure of religion. Erasmus knew that the world was not ripe for a powerful movement on the lines of his own intimate ideas, and he remained a nominal Christian, stimulating people to think by attacking plain abuses. He refused, when pressed, to join Luther precisely because he did not believe the Christianity of Luther any more than the Christianity of Thomas Aquinas. He did a mighty work for modernism, and that is enough for us.

In Germany the work of the Renaissance was brief because it was soon lost in the roar and chaos of the Reformation, so that I leave it mainly for consideration elsewhere. Erasmus was not the first to teach Greek and translate Greek books there. Johann Müller and Rudolph Agricola had been to Italy to study Greek early in the sixteenth century, and they prepared the way for Erasmus in Germany. Johann Reuchlin, the first great German Humanist, studied Greek at Paris and

in Italy, and he revived the study of Hebrew (hitherto almost confined to the rabbis) which would in time, in a freer age, inspire the beginning of Biblical criticism. Reuchlin was summoned before the Inquisition at Cologne, a dense center of reaction, and although a representative of the Pope saved him, the friars persevered and induced Rome later to condemn him. He inspired Melanchthon and worked with Ulrich von Hutten. But there was formidable opposition in Germany to the Renaissance, and I consider such success as it had in Little Blue Book No. 1141.

In England the service of the classical Renaissance in guiding and confirming a native development, or broader Renaissance, is particularly clear. Early in the days of Humanism a few English scholars had gone to Italy to study Greek. They were "monks of Canterbury," and on their return they taught at Canterbury. The news slowly spread, and Oxford University, and later Cambridge University, started chairs of Greek. Erasmus went to England first in 1498, and he taught there from 1510 to 1513. He does not say so, but the heavy piety of the English Hellenists—one hesitates to call them Humanists—cannot have been entirely to his taste. It was a church group. Grocyn was a conservative Doctor of Divinity. Colet was Dean of St. Paul's Cathedral and an early Protestant in his zeal for pure and primitive Christianity. Linacre was a royal physician, but ended his days as a priest. Sir Thomas More, the wit and scholar and Utopianist, was the only real Humanist; and he

must have astonished, if not pained, Erasmus by eventually suffering the removal of his head for the Catholic faith.

Even in the sixteenth century, says Sir Richard Jebb, "Britain produced no scholar of the first rank," and "the British press sent forth few books which advanced Greek or Latin learning." A painful confession for an academic Englishman, but, as all the world knows, England produced something of infinitely greater value than commentaries on Tacitus or new editions of Ovid. It not only reformed education in the classical sense, and produced some great early educators, but it gave birth to Shakespeare and the Elizabethan drama, to Francis Bacon and the new zeal for science, to a literature which would not shrink, as the Italian did, but remain fertile in great productions down to the nineteenth century. It adopted the classic model in architecture, started a new school of painting, joined with great effect in the conquest of the seas, brought about a general refinement of manners (compared with the Middle Ages), and founded "the Mother of Parliaments."

That in all this we have to see the quickening of a native development by putting into it the ferment of the classical spirit needs no proof. Shakespeare teems with evidence. Even his early comedies are inspired by Plautus and the Italian imitators of Plautus, his tragedies often turn to pagan themes, and his language is one of the most singular mixtures of exquisite imagery in pure English and long Latin words which many of his hearers can

hardly have understood. Francis Bacon is heavily indebted to early Greek science. Thomas More is equally indebted to Plato.

The political and economic conditions were at the time favoring a revival of civilization in England, but the effect of the Renaissance, in the narrower sense, is obvious. Men caught its spirit even when they ignored its scholarship. The standard of conduct remained gross, both before and after the Reformation. The life of the mass of the people—"the clowns," in Shakespearean language—was so coarse and stupid that we can hardly imagine it. The idea that Elizabethan days had more sexual license than earlier days can only occur to people who do not know the Middle Ages. But this freedom, as I said in speaking of Christendom generally, became more deliberate and respectable. It was not a sneaking infringement of a divine law. Man had a sense of mastery. Life and love were his possessions. The soft touch of silk, the perfume of flowers, the thrill of gay music and dancing, the flash of gold and jewels, were good things; and if they did quicken the pulse, well . . . Men were not yet quite clear how they stood with the Almighty in such matters, but they were vaguely asserting that human right to all knowledge, power, and pleasure which our age is at length formulating in incontrovertible terms.

We have now, therefore, a correct historical view of the course of human events and can judge for ourselves the timid and accommodating phrases of some of our modern his-

torical writers. Indeed, it is not only from concessions to the noisy religious crowd that the professors occasionally use language that is not historically correct. The field of knowledge is so vast that the historical specialist cannot take into account all the elements of the problem he is discussing, all the streams which have contributed to the stretch of the river that he is contemplating. On the other hand, the general historian, as far as he still exists, had to learn such a mass of detail that is humanly trivial and irrelevant that he cannot completely command any particular theme. One of the ablest and most independent historical teachers in America refers to "the civilizing force of Christianity." He has never studied Christianity in that respect.

In twelve Little Blue Books*—apart from the essays on the various ancient civilizations and on the origin of Christianity—I tell the story of Christendom up to the threshold of modern times. I use no facts that are called into question in modern history and no authorities that are not recognized. In fact, I base the narrative very largely on my own reading of

*As follows: Legends of Saints and Martyrs (Little Blue Book No. 1107); How Christianity "Triumphed" (No. 1110); The Evolution of Christian Doctrine (No. 1121); The Degradation of Woman (No. 1122); Christianity and Slavery (No. 1127); The Church and the School (No. 1128); The Dark Ages (No. 1130); New Light on Witchcraft (No. 1132); The Horrors of the Inquisition (No. 1134); Medieval Art and the Church (No. 1136); The Moorish Civilization in Spain (No. 1137); and the present volume.

the contemporary chroniclers from the fourth to the sixteenth century.

And this story yields us a conclusion of decisive value in the religious controversy of our time. Christianity never was, and is not now, a civilizing force. It includes moral sentiments which make for civilization, but not a single one of those sentiments is peculiar to it, and they are so mixed with quixotic puritanism and impossible beliefs that in their Christian form they proved ineffective. When that creed was forced upon Europe a high and sober civilization, with a most extensive system of education, controlled a hundred million people. Within a century or two Europe sank to a level of ignorance and disorder to which we cannot give the name of civilization. We are prepared to make every allowance for the Church in view of the barbaric invasions, but history shows that tribes at the same level of culture could be civilized in the course of a century or century and a half where there were real civilizing forces, yet Europe remained semi-barbarous for six or seven centuries, and, as far as the mass of the people were concerned, grosser than the Greeks and Romans for more than a thousand years. And, when the awakening came, we discern no call of the Church, no impulse from religion, but a spontaneous movement away from religion quickened and guided by the Mohammedans and the revived ideals of the pagan world.

A GUIDE TO ARISTOTLE

I. THE HISTORICAL BACKGROUND

Aristotle was born at Stagira, a Macedonian city some two hundred miles to the north of Athens, in the year 384 B. C. His father was friend and physician to Amyntas, King of Macedon and grandfather of Alexander. Aristotle himself seems to have become a member of the great medical fraternity of Asclepiads. He was brought up in the odor of medicine as many later philosophers were brought up in the odor of sanctity; he had every opportunity and encouragement to develop a scientific bent of mind; he was prepared from the beginning to become the founder of science.

We have a choice of stories for his youth. One narrative represents him as squandering his patrimony in riotous living, joining the army to avoid starvation, returning to Stagira to practice medicine, and going to Athens at the age of thirty to study philosophy under

Arrived at Chalcis, Aristotle fell ill; Diogenes Laertius tells us that the old philosopher, in utter disappointment with the turn of all things against him, committed suicide by drinking hemlock.¹ However induced, his illness proved fatal; and a few months after leaving Athens (322 B. C.) the lonely Aristotle died.

In the same year, and at the same age, sixty-two, Demosthenes, greatest of Alexander's enemies, drank poison. Within twelve months Greece had lost her greatest ruler, her greatest orator, and her greatest philosopher. The glory that had been Greece faded now in the dawn of the Roman sun; and the grandeur that was Rome was the pomp of power rather than the light of thought. And then that grandeur too decayed, that little light went almost out. For a thousand years darkness brooded over the face of Europe. All the world awaited the resurrection of philosophy.

Plato. A more dignified story takes him to Athens at the age of eighteen, and puts him at once under the tutelage of the great Master; but even in this likelier account there is sufficient echo of a reckless and irregular youth, living rapidly.¹ The horrified reader may console himself by observing that in either story our philosopher anchors at last in the quiet groves of the Academy.

Under Plato he studied eight—or twenty—years; and indeed the pervasive Platonism of Aristotle's speculations—even of those most anti-Platonic—suggests the longer period. One would like to imagine these as very happy years: a brilliant pupil guided by an incomparable teacher, walking like Greek lovers in the gardens of philosophy. But they were both geniuses; and it is notorious that geniuses accord with one another as harmoniously as dynamite with fire. Almost half a century separated them; it was difficult for understanding to bridge this gap of years and cancel the incompatibility of souls. Plato recognized the greatness of this strange new pupil from

¹Grote, *Aristotle*, London, 1872. p. 4; Zeller, *Aristotle and the Earlier Peripatetics*, London, 1897, vol. i, pp. 6f.

the supposedly barbarian north, and spoke of him once as the *Nous* of the Academy,—as if to say, Intelligence personified. Aristotle had spent money lavishly on the collection of books (that is, in those printless days, manuscripts); he was the first, after Euripides, to gather together a library, and the foundation of the principles of library classification was among his many contributions to scholarship. Therefore Plato spoke of Aristotle's home as "the house of the reader," and seems to have meant the sincerest compliment; but some ancient gossip will have it that the Master intended a sly but vigorous dig at a certain book-wormishness in Aristotle. A more authentic quarrel seems to have arisen towards the end of Plato's life. Our ambitious youth apparently developed an "Oedipus complex" against his spiritual father for the favors and affections of philosophy, and began to hint that wisdom would not die with Plato; while the old sage spoke of his pupil as a foal that kicks his mother after draining her dry.¹ The learned Zeller,² in whose pages Aristotle almost achieves the

¹Benn, *The Greek Philosophers*, London, 1882, vol. i, p. 283.

²Vol. i, p. 11.

Nirvana of respectability, would have us reject these stories; but we may presume that where there is still so much smoke there was once a fire.

The other incidents of this Athenian period are still more problematical. Some biographers tell us that Aristotle founded a school of oratory to rival Isocrates; and that he had among his pupils in this school the wealthy Hermias, who was soon to become autocrat of the city-state of Atarneus. After reaching this elevation Hermias invited Aristotle to his court; and in the year 344 B. C. he rewarded his teacher for past favors by bestowing upon him a sister (or a niece) in marriage. One might suspect this as a Greek gift; but the historians hasten to assure us that Aristotle, despite his genius, lived happily enough with his wife, and spoke of her most affectionately in his will. It was just a year later that Philip, King of Macedon, called Aristotle to the court at Pella to undertake the education of Alexander. It bespeaks the rising repute of our philosopher that the greatest monarch of the time, looking about for the greatest teacher, should single out Aristotle to be the tutor of the future master of the world.

Philip was determined that his son should have every educational advantage, for he had made for him illimitable designs. His conquest of Thrace in 356 B. C. had given him command of gold mines which at once began to yield him precious metal to ten times the amount then coming to Athens from the falling silver of Laurium; his people were vigorous peasants and warriors, as yet unspoiled by city luxury and vice: here was the combination that would make possible the subjugation of a hundred petty city-states and the political unification of Greece. Philip had no sympathy with the individualism that had fostered the art and intellect of Greece but had at the same time disintegrated her social order; in all these little capitals he saw not the exhilarating culture and the unsurpassable art, but the commercial corruption and the political chaos; he saw insatiable merchants and bankers absorbing the vital resources of the nation, incompetent politicians and clever orators misleading a busy populace into disastrous plots and wars, factions cleaving classes and classes congealing into castes: this, said Philip, was not a nation but only a welter of individuals,—geniuses and

and structure and entelechy;¹ the egg of the hen is internally designed or destined to become not a duck but a chick; the acorn becomes not a willow but an oak. This does not mean for Aristotle that there is an external providence designing earthly structures and events; rather the design is internal, and arises from the type and function of the thing. "Divine Providence coincides completely for Aristotle with the operation of natural causes."²

Yet there is a God, though not perhaps the simple and human god conceived by the forgivable anthropomorphism of the adolescent mind. Aristotle approaches the problem from the old puzzle about motion—how, he asks, does motion begin? He will not accept the possibility that motion is as beginningless as he conceives matter to be: matter may be eternal, because it is merely the everlasting possibility of future forms; but when and how did that vast process of motion and formation,

¹*Entelecheia*—having (*echo*) its purpose (*telos*) within (*entos*); one of those magnificent Aristotelian terms which gather up into themselves a whole philosophy. The informed reader need not be reminded that the "orthogenic" school of evolutionists finds its first formulation in these passages of Aristotle.

²*Ethics*, i, 10; Zeller, ii, 329.

begin which at last filled the wide universe with an infinity of shapes? Surely motion has a source, says Aristotle; and if we are not to plunge drearily into an infinite regress, putting back our problem step by step, endlessly, we must posit a prime mover unmoved (*primum mobile immotum*), a being incorporeal, indivisible, spaceless, sexless, passionless, changeless, perfect and eternal. God does not create, but he moves, the world; and he moves it not as a mechanical force but as the total motive of all operations in the world; "God moves the world as the beloved object moves the lover."¹ He is the final cause of nature, the drive and purpose of things, the form of the world; the principle of its life, the sum of its vital processes and powers, the inherent goal of its growth, the energizing entelechy of the whole. He is pure energy;² the Scholastic *Actus Purus*—activity *per se*; perhaps the mystic "Force" of modern physics and philosophy. He is not so much a person as a magnetic power.³

Yet, with his usual inconsistency, Aristotle

¹*Metaphysics*, ix, 7.

²*Ibid.*, xii, 8.

³Grant, 173.

represents God as self-conscious spirit. A rather mysterious spirit; for Aristotle's God never does anything; he has no desires, no will, no purpose; he is activity so pure that he never acts. He is absolutely perfect; therefore he cannot desire anything; therefore he does nothing. His only occupation is to contemplate the essence of things; and since he himself is the essence of all things, the form of all forms, his sole employment is the contemplation of himself.¹ Poor Aristotelian God!—he is a *roi-fainéant*, a do-nothing king; "the king reigns, but he does not rule." No wonder the British like Aristotle; his God is obviously copied from their king.

Or from Aristotle himself. Our philosopher so loved contemplation that he sacrificed to it his conception of divinity. His God is of the quiet Aristotelian type, nothing romantic, withdrawn to his ivory tower from the strife and stain of things; all the world away from the philosopher-kings of Plato, or from the stern flesh-and-blood reality of Yahveh, or the gentle and solicitous fatherhood of the Christian God.

¹*Meta.* xii, 8; *Ethics*, x., 8.

VI. PSYCHOLOGY AND THE NATURE OF ART

Aristotle's psychology is marred with similar obscurity and vacillation. There are many interesting passages: the power of habit is emphasized, and is for the first time called "second nature"; and the laws of association, though not developed, find here a definite formulation. But both the crucial problems of philosophical psychology—the freedom of the will and the immortality of the soul—are left in haze and doubt. Aristotle talks at times like a determinist—"We cannot directly will to be different from what we are"; but he goes on to argue, against determinism, that we can choose what we shall be, by choosing now the environment that shall mould us; so we are free in the sense that we mould our own characters by our choice of friends, books, occupations, and amusements.¹ He does not anticipate the determinist's ready reply that these formative choices are themselves determined by our antecedent character, and this at last by un-

¹*Ethics*, iii, 7.

later age has drawn upon Aristotle, and stood upon his shoulders to see the truth. The varied and magnificent culture of Alexandria found its scientific inspiration in him. His *Organon* played a central rôle in shaping the minds of the medieval barbarians into disciplined and consistent thought. The other works, translated by Nestorian Christians into Syriac in the fifth century A. D., and thence into Arabic and Hebrew in the tenth century, and thence into Latin towards 1225, turned scholasticism from its eloquent beginnings in Abélard to encyclopedic completion in Thomas Aquinas (1227-1274). The Crusaders brought back more accurate Greek copies of the philosopher's texts; and the Greek scholars of Constantinople brought further Aristotelian treasures with them when, after 1453, they fled from the besieging Turks. The works of Aristotle came to be for European philosophy what the Bible was for theology—an almost infallible text, with solutions for every problem. In 1215 the Papal legate at Paris forbade teachers to lecture on his works; in 1231 Gregory IX appointed a commission to expurgate him; by 1260 he was *de rigueur* in every Christian school, and

ecclesiastical assemblies penalized deviations from his views. Chaucer describes his student as happy by having

At his beddes hed

and in the first circles of Hell, says Dante,

"I saw the Master there of those who know,
Amid the philosophic family,
By all admired, and by all revered;
There Plato too I saw, and Socrates,
Who stood beside him closer than the rest."

Such lines give us some inkling of the honor which a thousand years offered to the Stagirite. Not till new instruments, accumulated observations, and patient experiments remade science and gave irresistible weapons to Occam and Ramus, to Roger and Francis Bacon, was the reign of Aristotle ended. No other mind had for so long a time ruled the intellect of mankind.

¹Quoted by Benn, i, 276.

²*Inferno*, iv, 131f.

X. LATER LIFE AND DEATH

Meanwhile life had become unmanageably complicated for our philosopher. He found himself on the one hand embroiled with Alexander for protesting against the execution of Calisthenes (a nephew of Aristotle), who had refused to worship Alexander as a god; and Alexander had answered the protest by hinting that it was quite within his omnipotence to put even philosophers to death. At the same time Aristotle was busy defending Alexander among the Athenians. He preferred Greek solidarity to city patriotism, and thought culture and science would flourish better when petty sovereignties and disputes were ended; and he saw in Alexander what Goethe was to see in Napoleon—the philosophic unity of a chaotic and intolerably manifold world. The Athenians, hungering for liberty, growled at Aristotle, and became bitter when Alexander had a statue of the philosopher put up in the heart of the hostile city. In this turmoil we get an impression of Aristotle quite contrary to that left upon us by his *Ethics*: here is a man

not cold and inhumanly calm, but a fighter, pursuing his Titanic work in a circle of enemies on every side. The successors of Plato at the Academy, the oratorical school of Isocrates, and the angry crowds that hung on Demosthenes' acid eloquence, intrigued and clamored for his exile or his death.

And then, suddenly (323 B. C.), Alexander died. Athens went wild with patriotic joy; the Macedonian party was overthrown, and Athenian independence was proclaimed. Antipater, successor of Alexander and intimate friend of Aristotle, marched upon the rebellious city. Most of the Macedonian party fled. Eurymedon, a chief priest, brought in an indictment against Aristotle, 'charging him with having taught that prayer and sacrifice were of no avail. Aristotle saw himself fated to be tried by juries and crowds incomparably more hostile than those that had murdered Socrates. Very wisely, he left the city, saying that he would not give Athens a chance to sin a second time against philosophy. There was no cowardice in this; an accused person at Athens had always the option of preferring exile.¹

¹Grote, 20.

Arrived at Chalcis, Aristotle fell ill; Diogenes Laertius tells us that the old philosopher, in utter disappointment with the turn of all things against him, committed suicide by drinking hemlock.¹ However induced, his illness proved fatal; and a few months after leaving Athens (322 B. C.) the lonely Aristotle died.

In the same year, and at the same age, sixty-two, Demosthenes, greatest of Alexander's enemies, drank poison. Within twelve months Greece had lost her greatest ruler, her greatest orator, and her greatest philosopher. The glory that had been Greece faded now in the dawn of the Roman sun; and the grandeur that was Rome was the pomp of power rather than the light of thought. And then that grandeur too decayed, that little light went almost out. For a thousand years darkness brooded over the face of Europe. All the world awaited the resurrection of philosophy.

C. had given him command of gold mines which at once began to yield him precious metal to ten times the amount then coming to Athens from the failing silver of Laurium; his people were vigorous peasants and warriors, as yet unspoiled by city luxury and vice: here was the combination that would make possible the subjugation of a hundred petty city-states and the political unification of Greece. Philip had no sympathy with the individualism that had fostered the art and intellect of Greece but had at the same time disintegrated her social order; in all these little capitals he saw not the exhilarating culture and the unsurpassable art, but the commercial corruption and the political chaos; he saw insatiable merchants and bankers absorbing the vital resources of the nation, incompetent politicians and clever orators misleading a busy populace into disastrous plots and wars, factions cleaving classes and classes congealing into castes: this, said Philip, was not a nation but only a welter of individuals,—geniuses and

slaves; he would bring the hand of order down upon this turmoil, and make all Greece stand up united and strong as the political center and basis of the world. In his youth in Thebes he had learned the arts of military strategy and civil organization under the noble Epaminondas; and now, with courage as boundless as his ambition, he bettered the instruction. In 338 B. C. he defeated the Athenians at Chaeronea, and saw at last a Greece united, though with chains. And then, as he stood upon this victory, and planned how he and his son should master and unify the world, he fell under an assassin's hand.

Alexander, when Aristotle came, was a wild youth of thirteen; passionate, epileptic, almost alcoholic; it was his pastime to tame horses untamable by men. The efforts of the philosopher to cool the fires of this budding volcano were not of much avail; Alexander had better success with Bucephalus than Aristotle with Alexander. "For a while," says Plutarch, "Alexander loved and cherished Aristotle no less than as if he had been his own father; saying that though he had received life from the one, the other had taught him the art of living."

("Life," says a fine Greek adage, "is the gift of nature; but beautiful living is the gift of wisdom.") "For my part," said Alexander in a letter to Aristotle, "I had rather excel in the knowledge of what is good than in the extent of my power and dominion." But this was probably no more than a royal-youthful compliment; beneath the enthusiastic tyro of philosophy was the fiery son of a barbarian princess and an untamed king; the restraints of reason were too delicate to hold these ancestral passions in leash; and Alexander left philosophy after two years to mount the throne and ride the world. History leaves us free to believe (though we should suspect these pleasant thoughts) that Alexander's unifying passion derived some of its force and grandeur from his teacher, the most synthetic thinker in the history of thought; and that the conquest of order in the political realm by the pupil, and in the philosophic realm by the master, were but diverse sides of one noble and epic project—two magnificent Macedonians unifying two chaotic worlds.

But as usual, impersonal economic factors lay hidden under the surface of personal and

dramatic events. The development of commerce had bound the Mediterranean nations, from Persia to Spain, into one great web of trade; and this commercial unity, harassed in a thousand ways by political frontiers, autocratic tolls, and the vicissitudes of unprotected transport, called insistently for unity of political and military administration. Persia controlled the Asiatic land routes of the eastern half of this economic system; Greece (or, since Philip, Macedon) controlled the Mediterranean sea-routes of the western half. It appeared to Alexander that the absorption of one of these political systems by the other was made inevitable by the growing pressure of economic circumstance. Hence his reply to the Persian embassy which came to him from Darius, suggesting conciliation and division of rule: "As it would be impossible for order to reign in the world with two suns, so it is impossible for the earth to be at peace with two masters." And so he set out, in the year 334 B. C., to conquer Persia. Three years later the task was accomplished, and the Mediterranean world was one.

He had left behind him, in the cities of

Greece, governments favorable to him but populations resolutely hostile. The long tradition of a free and once imperial Athens made subjection—even to a brilliant world-conquering despot—intolerable; and the bitter eloquence of Demosthenes kept the Assembly always on the edge of revolt against the “Macedonian party” that held the reins of city power. Now when Aristotle, after another period of travel, returned to Athens in the year 334 B. C., he very naturally associated with this Macedonian group, and took no pains to conceal his approval of Alexander’s unifying rule. As we study the remarkable succession of works, in speculation and research, which Aristotle proceeded to unfold in the last twelve years of his life; and as we watch him in his multifold tasks of organizing his school, and of organizing such a wealth of knowledge as probably never before had passed through the mind of one man; let us occasionally remember that this was no quiet and secure pursuit of truth; that at any minute the political sky might change, and precipitate a storm in this peaceful philosophic life. Only

with this situation in mind shall we understand Aristotle's political philosophy, and his tragic end.

II. THE WORK OF ARISTOTLE

It was not hard for the instructor of the king of kings to find pupils even in so hostile a city as Athens. When, in the fifty-third year of his age, Aristotle established his school, the Lyceum, so many students flocked to him that it became necessary to make complicated regulations for the maintenance of order. The students themselves determined the rules, and elected, every ten days, one of their number to supervise the School. But we must not think of it as a place of rigid discipline; rather the picture which comes down to us is of scholars eating their meals in common with the master, and learning from him as he and they strolled up and down the Walk along the athletic field from which the Lyceum took its name.¹

¹The Walk was called *Peripatos*; hence the later name, Peripatetic School. The athletic field was part of the grounds of the temple of Apollo Lyceus—the protector of the flock against the wolf (*lycos*).

The new School was no mere replica of that which Plato had left behind him. The Academy was devoted above all to mathematics and to speculative and political philosophy; the Lyceum had rather a tendency to biology and the natural sciences. If we may believe Pliny,¹ Alexander instructed his hunters, gamekeepers, gardeners and fishermen to furnish Aristotle with all the zoological and botanical material he might desire; other ancient writers tell us that at one time he had at his disposal a thousand men scattered throughout Greece and Asia, collecting for him specimens of the fauna and flora of every land. With this wealth of material he was enabled to establish the first great zoological garden that the world had seen. We can hardly exaggerate the influence of this collection upon his science and his philosophy.

Where did Aristotle derive the funds to finance these undertakings? He was himself, by this time, a man of spacious income; and he had married into the fortune of one of the most powerful public men in Greece. Athenaeus (no

¹*Hist. Nat.*, viii, 16; in Lewes, *Aristotle, a Chapter from the History of Science*, London, 1864, p. 15.

doubt with some exaggeration) relates that Alexander gave Aristotle, for physical and biological equipment and research, the sum of 800 talents (in modern purchasing power, some \$4,000,000).¹ It was at Aristotle's suggestion, some think, that Alexander sent a costly expedition to explore the sources of the Nile and discover the causes of its periodical overflow.² Such works as the digest of 158 political constitutions, drawn up for Aristotle, indicate a considerable corps of aides and secretaries. In short we have here the first example in European history of the large-scale financing of science by public wealth. What knowledge would we not win if modern states were to support research on a proportionately lavish scale!

Yet we should do Aristotle injustice if we were to ignore the almost fatal limitations of equipment which accompanied these unprecedented resources and facilities. He was compelled "to fix time without a watch, to compare degrees of heat without a thermometer, to observe the heavens without a telescope, and the weather without a barometer. . . . Of all

¹Grant, *Aristotle*, Edinburgh, 1877, p. 18.

²The expedition reported that the inundations were due to the melting of the snow on the mountains of Abyssinia.

our mathematical, optical and physical instruments he possessed only the rule and compass, together with the most imperfect substitutes for some few others. Chemical analysis, correct measurements and weights, and a thorough application of mathematics to physics, were unknown. The attractive force of matter, the law of gravitation, electrical phenomena, the conditions of chemical combination, pressure of air and its effects, the nature of light, heat, combustion, etc., in short, all the facts on which the physical theories of modern science are based were wholly, or almost wholly, undiscovered.”¹

See, here, how inventions make history: for lack of a telescope Aristotle's astronomy is a tissue of childish romance; for lack of a microscope his biology wanders endlessly astray. Indeed, it was in industrial and technical invention that Greece fell furthest below the general standard of its unparalleled achievements. The Greek disdain of manual work kept everybody but the listless slave from direct acquaintance with the processes of production, from that stimulating contact with

¹Zeller, i, 264, 443.

machinery which reveals defects and prefigures possibilities; technical invention was possible only to those who had no interest in it, and could not derive from it any material reward. Perhaps the very cheapness of the slaves made invention lag; muscle was still less costly than machines. And so, while Greek commerce conquered the Mediterranean Sea, and Greek philosophy conquered the Mediterranean mind, Greek science straggled, and Greek industry remained almost where Ægean industry had been when the invading Greeks had come down upon it, at Cnossos, at Tiryns and Mycene, a thousand years before. No doubt we have here the reason why Aristotle so seldom appeals to experiment; the mechanisms of experiment had not yet been made; and the best he could do was to achieve an almost universal and continuous observation. Nevertheless the vast body of data gathered by him and his assistants became the groundwork of the progress of science, the text-book of knowledge for two thousand years; one of the wonders of the work of man.

Aristotle's writings ran into the hundreds. Some ancient authors credit him with four

hundred volumes, others with a thousand. What remains is but a part, and yet it is a library in itself—conceive the scope and grandeur of the whole. There are, first, the *Logical* works: “Categories,” “Topics,” “Prior” and “Posterior Analytics,” “Propositions,” and “Sophistical Refutations;” these works were collected and edited by the later Peripatetics under the general title of Aristotle’s “Organon,”—that is, the organ or instrument of correct thinking. Secondly, there are the *Scientific* works: “Physics,” “On the Heavens,” “Growth and Decay,” “Meteorology,” “Natural History,” “On the Soul,” “The Parts of Animals,” “The Movements of Animals,” and “The Generation of Animals.” There are, thirdly, the *Esthetic* works: “Rhetoric” and “Poetics.” And fourthly come the more strictly *Philosophical* works: “Ethics,” “Politics,” and “Metaphysics.”¹ Here, evidently, is the Encyclopedia Britannica of Greece: every problem under the sun and about it finds a place; no wonder there are more errors and absurdities here than in any other philosopher who ever

¹This is the chronological order, so far as known (Zeller, i, 156f). Our discussion will follow this order except in the case of the “Metaphysics.”

wrote. Here is such a synthesis of knowledge and theory as no man would ever achieve again till Spencer's day, and even then not half so magnificently; here, better than Alexander's fitful and brutal victory, was a conquest of the world. If philosophy is the quest of unity Aristotle deserves the high name that twenty centuries gave him—*Ille Philosophus: The Philosopher*.

Naturally, in a mind of such scientific turn, poesy was lacking. We must not expect of Aristotle such literary brilliance as floods the pages of the dramatist-philosopher Plato. Instead of giving us great literature, in which philosophy is embodied (and obscured) in myth and imagery, Aristotle gives us science, technical, abstract, concentrated; if we go to him for entertainment we shall sue for the return of our money. Instead of giving terms to literature, as Plato did, he builds the terminology of science and philosophy; we can hardly speak of any science today without employing terms which he invented; they lie like fossils in the strata of our speech: faculty, mean, maxim, (meaning, in Aristotle, the major premiss of a syllogism), category, energy,

actuality, motive, end, principle, form—these indispensable coins of philosophic thought were minted in his mind. And perhaps this passage from delightful dialogue to precise scientific treatise was a necessary step in the development of philosophy; and science, which is the basis and backbone of philosophy, could not grow until it had evolved its own strict methods of procedure and expression. Aristotle, too, wrote literary dialogues, as highly reputed in their day as Plato's; but they are lost, just as the scientific treatises of Plato have perished. Probably time has preserved of each man the better part.

Finally, it is possible that the writings attributed to Aristotle were not his, but were largely the compilations of students and followers who had embalmed the unadorned substance of his lectures in their notes. It does not appear that Aristotle published in his lifetime any writings except those on logic and rhetoric; and the present form of the logical treatises is due to later editing. In the case of the *Metaphysics* and the *Politics* the notes left by Aristotle seem to have been put together by his executors without revision or alteration.

Even the unity of style which marks Aristotle's writings, and offers an argument to those who defend his direct authorship, may be, after all, merely a unity given them through common editing by the Peripatetic School. About this matter there rages a sort of Homeric question, of almost epic scope, into which the busy reader will not care to go, and on which a modest student will not undertake to judge.¹ We may at all events be sure that Aristotle is the spiritual author of all these books that bear his name: that the hand may be in some cases another's hand, but that the head and the heart are his.²

III. THE FOUNDATION OF LOGIC.

The first great distinction of Aristotle is that almost without predecessors, almost entirely by his own hard thinking, he created a new

¹Cf. Zeller, ii, 204, note; Encyc. Britt., ii, 509; and Shule: *History of the Aristotelian Writings*.

²The reader who wishes to go to the philosopher himself will find the *Meteorology* an interesting example of Aristotle's scientific work; he will derive much practical instruction from the *Rhetoric*; and he will find Aristotle at his best in books i-ii of the *Ethics*, and books i-iv of the *Politics*. The best translation of the *Ethics* is Well-don's; of the *Politics*, Jowett's. Sir Alexander Grant's *Aristotle* is a simple book; Zeller's *Aristotle* (vols. iii-iv in his *Greek Philosophy*), is scholarly but dry; Gomperz's *Greek Thinkers* (vol. iv) is masterly but difficult.

science—Logic. Renan¹ speaks of “the ill training of every mind that has not, directly or indirectly, come under Greek discipline;” but in truth the Greek intellect itself was undisciplined and chaotic till the ruthless formulae of Aristotle provided a ready method for the test and correction of thought. Even Plato (if a lover may so far presume) was an unruly and irregular soul, caught up too frequently in a cloud of myth, and letting beauty too richly veil the face of truth. Aristotle himself, as we shall see, violated his own canons plentifully; but then he was the product of his past, and not of that future which his thought would build. The political and economic decay of Greece brought a weakening of the Hellenic mind and character after Aristotle; but when a new race, after a millenium of barbaric darkness, found again the leisure and ability for speculation, it was Aristotle’s “Organon” of logic, translated by Boethius (470-525 A. D.), that became the very mould of medieval thought, the strict mother of that scholastic philosophy which, though rendered sterile by encircling dogmas, nevertheless trained the in-

¹*History of the People of Israel*, vol. v, p. 338.

tellekt of adolescent Europe to reasoning and subtlety, constructed the terminology of modern science, and laid the bases of that same maturity of mind which was to outgrow and overthrow the very system and methods which had given it birth and sustenance.

Logic means, simply, the art and method of correct thinking. It is the *logy* or method of every science, of every discipline and every art; and even music harbors it. It is a science because to a considerable extent the processes of right thinking (and we use "right" not in a moral but in a mathematical sense) can be reduced to rules like physics and geometry, and taught to any normal mind; it is an art because by practice it gives to thought, at last, that unconscious and immediate accuracy which guides the fingers of the pianist over his instrument to effortless harmonies. Nothing is so dull as logic, and nothing is so important.

There was a hint of this new science in Socrates' maddening insistence on definitions, and in Plato's constant refining of every concept. Aristotle's little treatise on *Definitions* shows how his logic found nourishment at this source. "If you wish to converse with me," said Vol-

taire, "define your terms." How many a debate would have been deflated into a paragraph if the disputants had dared to define their terms! This is the alpha and omega of logic, the heart and soul of it, that every important term in serious discourse shall be subjected to strictest scrutiny and definition. It is difficult, and ruthlessly tests the mind; but once done it is half of any task.

Yet how shall we proceed to define an object or a term? Aristotle answers that every good definition has two parts, stands on two solid feet: first, it assigns the object in question to a class or group of objects whose general characteristics are also its own—so man is, first of all, an animal; and secondly, it indicates wherein the object differs from all the other members in its class—so man, in the Aristotelian system, is a *rational* animal, his "specific difference" is that unlike all other animals he is rational (here, you see, is the origin of a pretty legend). Aristotle drops an object into the ocean of its class, then takes it out all dripping with generic meaning, with the marks of its kind and group; while its individuality and difference shine out all the

more clearly for this juxtaposition with other objects which resemble it so much and are so different.

Passing out from this rear line of logic we come into the great battlefield on which Aristotle fought out with Plato the dread question of "universals"; it was the first conflict in a war which was to last till our own day, and make all medieval Europe ring with the clash of "realists" and "nominalists."¹ A universal, to Aristotle, is any common noun, any name capable of universal application to the members of a class: so *animal*, *man*, *book*, *tree*, are universals. But these universals are subjective notions, not tangibly objective realities; they are *nomina* (names), not *res* (things); all that exists outside us is a world of individual and specific objects, not of generic and universal things; men exist, and trees, and animals; but man-in-general, or the universal man, does not exist, except in thought; he is a handy mental abstraction, not an external presence or *re-ality*. Now Aristotle understands Plato to have held

¹It was in reference to this debate that Friedrich Schlegel said, "Every man is born either a Platonist or an Aristotelian" (in Benn, i, 291).

that universals have objective existence; and indeed Plato had said that the universal is incomparably more lasting and important and substantial than the individual,—the latter being but a little wavelet in a ceaseless surf; *men* come and go, but *man* goes on forever. Aristotle's is a matter-of-fact mind; as William James would say, a tough, not a tender, mind; he sees the root of endless mysticism and scholarly nonsense in this Platonic "realism;" and he attacks it with all the vigor of a first polemic. As Brutus loved not Caesar less but Rome more, so Aristotle says, *Amicus Plato, sed magis amica veritas*—"Dear is Plato, but dearer still is truth." A hostile commentator might remark that Aristotle (like Nietzsche) criticizes Plato so keenly because he is conscious of having borrowed from him generously; no man is a hero to his debtors. But Aristotle has a healthy attitude, nevertheless; he is a realist almost in the modern sense; he is resolved to concern himself with the objective presence, while Plato is absorbed in a subjective future; or, to juggle with the words, Aristotle has a present objective, and Plato's subject is the future. There was, in the Socratic-Platonic

demand for definitions, a tendency away from things and facts to theories and ideas, from particulars to generalities, from science to scholasticism; at last Plato became so devoted to generalities that they began to determine his particulars, so devoted to ideas that they began to define or select his facts. Aristotle preaches a return to things, to the "unwithered face of nature" and reality; he had a lusty preference for the concrete particular, for the flesh and blood individual. But Plato so loved the general and universal that in the *Republic* he destroyed the individual to make a perfect state.

Yet, as is the usual humor of history, the young warrior takes over many of the qualities of the old master whom he assails. We have always goodly stock in us of that which we condemn: as only similars can be profitably contrasted, so only similar people quarrel, and the bitterest wars are over the slightest variations of purpose or belief. The knightly Crusaders found in Saladin a gentleman with whom they could quarrel amicably; but when the Christians of Europe broke into hostile camps there was no quarter for even the

●ourtliest foe. Aristotle is so ruthless with Plato because there is so much of Plato in him; he too remains a lover of abstractions and generalities, repeatedly betraying the simple fact for some speciously bedizened theory, and compelled to a continuous struggle to conquer the philosophic passion for exploring the empyrean.

There is a heavy trace of this in the most characteristic and original of Aristotle's contributions to philosophy—the doctrine of the syllogism. A syllogism is a trio of propositions of which the third (the conclusion) follows from the conceded truth of the other two (the “major” and “minor” premisses). E. g., man is a rational animal; but Socrates is a man; therefore Socrates is a rational animal. The mathematical reader will see at once that the structure of the syllogism resembles the proposition that two things equal to the same thing are equal to each other; if A is B, and C is A, then C is B. As in the mathematical case the conclusion is reached by canceling from both premisses their common term, A; so in our syllogism the conclusion is reached by canceling from both premisses their common term “man,” and combining what remains.

The difficulty, as logicians have pointed out from the days of Pyrrho to those of Stuart Mill, lies in this, that the major premiss of the syllogism takes for granted precisely the point to be proved; for if Socrates is not rational (and since no one questions that he is a man) it is not universally true that man is a rational animal. Aristotle would reply, no doubt, that where an individual is found to have a large number of qualities characteristic of a class ("Socrates is a man"), a strong presumption is established that the individual has the other qualities characteristic of the class ("rationality"). But apparently the syllogism is not a mechanism for the discovery of truth so much as for the clarification of exposition and thought.

All this, then, like the many other items of the *Organon*, has its value: "Aristotle has discovered and formulated every canon of theoretical consistency, and every artifice of dialectical debate, with an industry and acuteness which cannot be too highly extolled; and his labors in this direction have perhaps contributed more than any other single writer to the intellectual

stimulation of after ages.”¹ But no man ever lived who could lift logic to a lofty strain: a guide to correct reasoning is as elevating as a manual of etiquette; we may use it, but it hardly spurs us to nobility. Not even the bravest philosopher would sing to a book of logic underneath the bough. One always feels towards logic as Virgil bade Dante feel towards those who had been damned because of their colorless neutrality: *Non ragionam di lor, ma guarda e passa*—“Let us think no more about them, but look once and pass on.”

IV. THE ORGANIZATION OF SCIENCE

1. GREEK SCIENCE BEFORE ARISTOTLE

“Socrates,” says Renan,² “gave philosophy to mankind, and Aristotle gave it science. There was philosophy before Socrates, and science before Aristotle; and since Socrates and since Aristotle, philosophy and science have made immense advances. But all has been built upon the foundation which they laid.” Before Aris-

¹*Benn*, i, 307.

²*Inferno*, iii, 60.

³*Life of Jesus*, ch. 28.

totle, science was in embryo; with him it was born.

Earlier civilizations than the Greek had made attempts at science; but so far as we can catch their thought through their still obscure cuneiform and hieroglyphic script, their science was indistinguishable from theology. That is to say, these pre-Hellenic peoples explained every obscure operation in nature by some supernatural agency; everywhere there were gods. Apparently it was the Ionian Greeks who first dared to give natural explanations of cosmic complexities and mysterious events; they sought in physics the natural causes of particular incidents, and in philosophy a natural theory of the whole. Thales (640-550 B. C.), the "Father of Philosophy," was primarily an astronomer, who astonished the natives of Miletus by informing them that the sun and stars (which they were wont to worship as gods) were merely balls of fire. His pupil Anaximander (610-540 B. C.), the first Greek to make astronomic and geographical charts, believed that the universe had begun as an undifferentiated mass, from which all things had arisen by the separation of opposites; that astronomic history peri-

odically repeated itself in the evolution and dissolution of an infinite number of worlds; that the earth was at rest in space by a balance of internal impulsions (like Buridan's ass); that all our planet had once been fluid, but had been evaporated by the sun; that life had first been formed in the sea, but had been driven upon the land by the subsidence of the water; that of these stranded animals some had developed the capacity to breathe air, and had so become the progenitors of all later land life; that man could not from the beginning have been what he now was, for if man, on his first appearance, had been so helpless at birth, and had required so long an adolescence, as in these later days, he could not possibly have survived. Anaximenes, another Milesian (fl. 450 B. C.), described the primeval condition of things as a very rarefied mass, gradually condensing into wind, cloud, water, earth, and stone; the three forms of matter—gas, liquid and solid—were progressive stages of condensation; heat and cold were merely rarefaction and condensation; earthquakes were due to the solidification of an originally fluid earth; life and soul were one, an animating and expansive force present

in everything everywhere. Anaxagoras (500-428 B. C.), teacher of Pericles, seems to have given a correct explanation of solar and lunar eclipses; he discovered the processes of respiration in plants and fishes; and he explained man's intelligence by the power of manipulation that came when the fore-limbs were freed from the tasks of locomotion.

Heraclitus (530-470 B.C.), who left wealth and its cares to live a life of poverty and study in the shade of the temple porticoes at Ephesus, turned science from astronomy to earthlier concerns. All things forever flow and change, he said; even in the stillest matter there is unseen flux and movement. Cosmic history runs in repetitious cycles, each beginning and ending in fire (here is one source of the Stoic and Christian doctrine of last judgment and hell). "Through strife," says Heraclitus, "all things arise and pass away... War is the father and king of all: some he has made gods, and some men; some slaves, and some free." Where there is no strife there is decay: "the mixture which is not shaken decomposes." In this flux of change and struggle and selection, only one

thing is constant, and that is law. "This order, the same for all things, no one of gods or men has made; but it always was, and is, and shall be."—Empedocles (fl. 445 B. C., in Sicily) developed to a further stage the idea of evolution.¹ Organs arise not by design but by selection. Nature makes many trials and experiments with organisms, combining organs variously; where the combination meets environmental needs the organism survives and perpetuates its like; where the combination fails, the organism is weeded out; as time goes on, organisms are more and more intricately and successfully adapted to their surroundings.—Finally, in Leucippus (fl. 445 B. C.) and Democritus (460-360), master and pupil in Thracian Abdera, we get the last stage of pre-Aristotelian science—materialistic, deterministic atomism. "Everything," said Leucippus, "is driven by necessity." "In reality," says Democritus,² "there are only atoms and the void." Perception is due to the expulsion of atoms

¹Cf. Osborn, *From the Greeks to Darwin*; and M. Arnold, *Empedocles on Etna*.

²Democritus is ranked above Plato and Aristotle in Francis Bacon's *De Principis* (*Philosophical Works*, ed. Robertson, London, 1905, p. 650).

from the object upon the sense organ.¹ There is or have been or will be an infinite number of worlds; at every moment planets are colliding and dying, and new worlds are rising out of chaos by the selective aggregation of atoms of similar size and shape. There is no design; the universe is a machine.

This, in dizzy and superficial summary, is the story of Greek science before Aristotle. Its cruder items can be well forgiven when we consider the narrow circle of experimental and observational equipment within which these pioneers were compelled to work. The stagnation of Greek industry under the incubus of slavery prevented the full development of these magnificent beginnings; and the rapid complication of political life in Athens turned the Sophists and Socrates and Plato away from these physical and biological researches into the vaguer paths of ethical and political theory. It is one of the many glories of Aristotle that he was broad and brave enough to compass and combine these two lines of Greek thought, the physical and the moral; that going back

¹Cf. Newton's theory of light, now (through Einstein) returning into favor.

beyond his teacher, he caught again the thread of scientific development in the pre-Socratic Greeks, carried on their work with more resolute detail, and more varied observation, and brought together all the accumulated results in a magnificent body of organized science.

2. ARISTOTLE AS A NATURALIST

If we begin here chronologically, with his *Physics*, we shall be disappointed; for we find that this treatise is really a *metaphysics*, an abstruse analysis of matter, motion, space, time, infinity, cause, and other such "ultimate concepts." One of the more lively passages is an attack on Democritus' "void": there can be no void or vacuum in nature, says Aristotle, for in a vacuum all bodies would fall with equal velocity; this being impossible, "the supposed void turns out to have nothing in it"—an instance at once of Aristotle's very occasional humor, his addiction to unproved assumptions, and his tendency to disparage his predecessors in philosophy. It was the habit of our philosopher to preface his works with historical sketches of previous contributions to the sub-

ject in hand, and to add to every contribution an annihilating refutation. "Aristotle, after the Ottoman manner," says Bacon, "thought he could not reign secure without putting all his brethren to death."¹ But to this fratricidal mania we owe much of our knowledge of pre-Socratic thought.

For reasons already given, Aristotle's astronomy represents very little advance upon his predecessors. He rejects the view of Pythagoras (sixth century B. C.) that the sun is the center of our system; he prefers to give that honor to the earth. But the little treatise on meteorology is full of brilliant observations, and even its speculations strike illuminating fire. This is a cyclic world, says our philosopher: the sun forever evaporates the sea, dries up rivers and springs, and transforms at last the boundless ocean into the barest rock; while conversely the uplifted moisture, gathered into clouds, falls and renews the rivers and the seas. Everywhere change goes on, imperceptibly but effectively. Egypt is "the work of the Nile," the product of its deposits through a

¹*Advancement of Learning*, bk. iii, ch. 4.

thousand centuries. Here the sea encroaches upon the land, there the land reaches out timidly into the sea; new continents and new oceans rise, old oceans and old continents disappear, and all the face of the world is changed and rechanged in a great systole and diastole of growth and dissolution. Sometimes these vast effects occur suddenly, and destroy the geological and material bases of civilization and even of life; great catastrophes have periodically denuded the earth and reduced man again to his first beginnings; like Sisyphus, civilization has repeatedly neared its zenith only to fall back into barbarism and begin *da capo* its upward travail. Hence the almost "eternal recurrence," in civilization after civilization, of the same inventions and discoveries, the same "dark ages" of slow economic and cultural accumulation, the same rebirths of learning and science and art. No doubt some popular myths are vague traditions surviving from earlier cultures. So the story of man runs in a dreary circle, because he is not yet master of the earth that holds him.

3. THE FOUNDATION OF BIOLOGY

It is not so with life.

As Aristotle walked wondering through his great zoological garden, he became convinced that the infinite variety of life could be arranged in a continuous series in which each link would be almost indistinguishable from the next. In all respects, whether in structure, or mode of life, or reproduction and rearing, or sensation and feeling, there are minute gradations and progressions from the lowest organisms to the highest.¹ At the bottom of the scale we can scarcely divide the living from the "dead": "nature makes so gradual a transition from the inanimate to the animate kingdom that the boundary lines which separate them are indistinct and doubtful"; and perhaps a degree of life exists even in the inorganic. Again, many species cannot with certainty be called plants or animals. And as in these lower organisms it is almost impossible at times to assign them to their proper genus and species, so similar are they; so in every order of

¹*Hist. Animalium*, viii.

life the continuity of gradations and differences is as remarkable as the diversity of functions and forms. But in the midst of this bewildering richness of structures certain things stand out convincingly: that life has grown steadily in complexity and in power;¹ that intelligence has progressed in correlation with complexity of structure and mobility of form;² that there has been an increasing specialization of function, and a continuous centralization of physiological control.³ Slowly life created for itself a nervous system and a brain; and mind moved resolutely on towards the mastery of its environment.

The remarkable fact here is that with all these gradations and similarities leaping to Aristotle's eyes, he does not come to the theory of evolution. He rejects Empedocles' doctrine that all organs and organisms are a survival of the fittest,⁴ and Anaxagoras' idea that man became intelligent by using his hands for manipulation rather than for movement; Aristotle thinks, on the contrary, that man so used his

¹*De Anima*, ii, 2.

²*De Partibus Animalium*, i, 7; ii, 10.

³*Ibid.*, iv, 5-6.

⁴*De Anima*, ii, 4.

hands because he had become intelligent.¹ Indeed, Aristotle makes as many mistakes as possible for a man who is founding the science of biology. He thinks, for example, that the male element in reproduction merely stimulates and quickens; it does not occur to him (what we now know from experiments in parthenogenesis) that the essential function of the sperm is not so much to fertilize the ovum as to provide the embryo with the heritable qualities of the male parent, and so permit the offspring to be a vigorous variant, a new admixture of two ancestral lines. As human dissection was not practised in his time, he is particularly fertile in physiological errors: he knows nothing of muscles, not even of their existence; he does not distinguish arteries from veins; he thinks the brain is an organ for cooling the blood; he believes, forgivably, that man has more sutures in the skull than woman; he believes, less forgivably, that man has only eight ribs on each side; he believes, incredibly and unforgivably, that woman has fewer teeth than man.² Apparently Aristotle's relations with women were of the most amicable kind.

¹*De Part. An.*, iv. 10.

²Gomperz, iv, 57; Zeller, i, 262, note; Lewes, 158, 165, etc.

Yet he makes a greater total advance in biology than any Greek before or after him. He perceives that birds and reptiles are near allied in structure; that the monkey is in form intermediate between quadrupeds and man; and once he boldly declares that man belongs in one group of animals with the viviparous quadrupeds (our "mammals").¹ He remarks that the soul in infancy is scarcely distinguishable from the soul of animals.² He makes the illuminating observation that diet often determines the mode of life; "for of beasts some are gregarious, and others solitary—they live in the way which is best adapted to . . . obtain the food of their choice."³ He anticipates Von Baer's famous law that characters common to the genus (like eyes and ears) appear in the developing organism before characters peculiar to its species (like the "formula" of the teeth), or to its individual self (like the final color of the eyes);⁴ and he reaches out across two thousand years to anticipate Spencer's generalization that individuation varies inversely as

¹*Hist. An.* i, 6; ii, 3.

²*Ibid.*, viii, 1.

³*Politics*, i, 8.

⁴*Hist. An.* i, 6; ii, 8.

genesis—that is, that the more highly developed and specialized a species or an individual happens to be, the smaller will be the number of its offspring.¹ He notices and explains reversion to type—the tendency of a prominent variation (like genius) to be diluted in mating and lost in successive generations. He makes many zoological observations which, temporarily rejected by later biologists, have been confirmed by modern research—of fishes that make nests, for example, and a species of shark that boasts of a placenta.

And finally he establishes the science of embryology. “He who sees things grow from their beginning,” he writes, “will have the finest view of them.” Hippocrates (b. 460 B. C.), greatest of Greek physicians, had given a fine example of the experimental method, by breaking a hen’s eggs at various stages of incubation; and had applied the results of these studies in his treatise “On the Origin of the Child.” Aristotle followed this lead and performed experiments which enabled him to give a description of the development of the chick which even

¹*De Generatione Animalium*, ii, 12.

today arouses the admiration of embryologists.¹ He must have performed some novel experiments in genetics, for he disproves the theory that the sex of the child depends on what testis supplies the reproductive fluid, by quoting a case where the right testis of the father had been tied and yet the children had been of different sexes.² He raises some very modern problems of heredity. A woman of Elis had married a negro; her children were all whites, but in the next generation negroes reappeared; where, asks Aristotle, was the blackness hidden in the middle generation?³ There was but a step from such a vital and intelligent query to the epochal experiments of Gregor Mendel (1822-1882). *Prudens quaestio dimidium scientiae*—to know what to ask is already to know half. Surely, despite the errors that mar these biological works, they form the greatest monument ever raised to the science by any one man. When we consider that before Aristotle there had been, so far as we know, no biology beyond scattered observations, we perceive that this

¹*De Part. An.*, iii, 4.

²Lewes, 112.

³Gomperz, iv, 169.

achievement alone might have sufficed for one life-time, and would have given immortality. But Aristotle had only begun.

V. METAPHYSICS AND THE NATURE OF GOD

His metaphysics grew out of his biology. Everything in the world is moved by an inner urge to become something greater than it is. Everything is both the *form* or reality which has grown out of something which was its *matter* or raw material; and it may in its turn be the matter out of which still higher forms will grow. So the man is the form of which the child was the matter; the child is the form and its embryo the matter; the embryo the form, the ovum the matter; and so back till we reach in a vague way the conception of matter without form at all. But such a formless matter would be no-thing, for every thing has a form. Matter, in its widest sense, is the possibility of form; and form is the actuality, the finished reality, of matter. Matter obstructs, form constructs. Form is not merely the shape but the shaping force, an inner necessity and

impulse which moulds mere material to a specific figure and purpose; it is the realization of a potential capacity of matter; it is the sum of the powers residing in anything to do, to be, or to become. Nature is the conquest of matter by form, the constant progression and victory of life.¹

Everything in the world moves naturally to a specific fulfilment. Of the varied causes which determine an event, the final cause, which determines the purpose, is the most decisive and important. The mistakes and failures of nature are due to the inertia of matter resisting the forming force of purpose—hence the abortions and the monsters that mar the panorama of life. Development is not haphazard or accidental (else how could we explain the almost universal appearance and transmission of useful organs?); everything is guided in a certain direction from within, by its nature.

¹Half of our readers will be pleased, and the other half amused, to learn that among Aristotle's favorite examples of matter and form are woman and man; the male is the active, formative principle; the female is passive clay, waiting to be formed. Female offspring are the result of the failure of form to dominate matter (*Gen. An.*, i, 2).

structure and entelechy;¹ the egg of the hen is internally designed or destined to become not a duck but a chick; the acorn becomes a willow but an oak. This does not mean for Aristotle that there is an external providence designing earthly structures and events; rather the design is internal, and arises from the type and function of the thing. "Divine providence coincides completely for Aristotle with the operation of natural causes."²

But there is a God, though not perhaps the multiple and human god conceived by the fashionable anthropomorphism of the adolescent. Aristotle approaches the problem from the old puzzle about motion—how, he asks, does motion begin? He will not accept the possibility that motion is as beginningless as he conceives matter to be: matter may be eternal, because it is merely the everlasting possibility of future forms; but when and how does that vast process of motion and formation

entelecheia—having (*echo*) its purpose (*telos*) within itself; one of those magnificent Aristotelian terms which gather up into themselves a whole philosophy. The medieval reader need not be reminded that the "orthodox" school of evolutionists finds its first formulation in these passages of Aristotle.

Nicomachean Ethics, i, 10; Zeller, ii, 329.

begin which at last filled the wide universe with an infinity of shapes? Surely motion has a source, says Aristotle; and if we are not to plunge drearily into an infinite regress, putting back our problem step by step, endlessly, we must posit a prime mover unmoved (*primum mobile immotum*), a being incorporeal, indivisible, spaceless, sexless, passionless, changeless, perfect and eternal. God does not create, but he moves, the world; and he moves it not as a mechanical force but as the total motive of all operations in the world; "God moves the world as the beloved object moves the lover."¹ He is the final cause of nature, the drive and purpose of things, the form of the world; the principle of its life, the sum of its vital processes and powers, the inherent goal of its growth, the energizing entelechy of the whole. He is pure energy;² the Scholastic *Actus Purus*—activity *per se*; perhaps the mystic "Force" of modern physics and philosophy. He is not so much a person as a magnetic power.³

Yet, with his usual inconsistency, Aristotle

¹*Metaphysics*, ix, 7.

²*Ibid.*, xii, 8.

³Grant, 173.

represents God as self-conscious spirit. A rather mysterious spirit; for Aristotle's God never does anything; he has no desires, no will, no purpose; he is activity so pure that he never acts. He is absolutely perfect; therefore he cannot desire anything; therefore he does nothing. His only occupation is to contemplate the essence of things; and since he himself is the essence of all things, the form of all forms, his sole employment is the contemplation of himself.¹ Poor Aristotelian God!—he is a *roi-fainéant*, a do-nothing king; "the king reigns, but he does not rule." No wonder the British like Aristotle; his God is obviously copied from their king.

Or from Aristotle himself. Our philosopher so loved contemplation that he sacrificed to it his conception of divinity. His God is of the quiet Aristotelian type, nothing romantic, withdrawn to his ivory tower from the strife and stain of things; all the world away from the philosopher-kings of Plato, or from the stern flesh-and-blood reality of Yahveh, or the gentle and solicitous fatherhood of the Christian God.

¹*Meta.* xii, 8; *Ethics*, x., 8.

VI. PSYCHOLOGY AND THE NATURE OF ART

Aristotle's psychology is marred with similar obscurity and vacillation. There are many interesting passages: the power of habit is emphasized, and is for the first time called "second nature"; and the laws of association, though not developed, find here a definite formulation. But both the crucial problems of philosophical psychology—the freedom of the will and the immortality of the soul—are left in haze and doubt. Aristotle talks at times like a determinist—"We cannot directly will to be different from what we are"; but he goes on to argue, against determinism, that we can choose what we shall be, by choosing now the environment that shall mould us; so we are free in the sense that we mould our own characters by our choice of friends, books, occupations, and amusements.¹ He does not anticipate the determinist's ready reply that these formative choices are themselves determined by our antecedent character, and this at last by un-

¹*Ethics*, iii, 7.

chosen heredity and early environment. He presses the point that our persistent use of praise and blame presupposes moral responsibility and free will; it does not occur to him that the determinist might reach from the same premisses a precisely opposite conclusion—that praise and blame are given that they may be part of the factors determining subsequent action.

Aristotle's theory of the soul begins with an interesting definition. The soul is the entire vital principle of any organism, the sum of its powers and processes. In plants the soul is merely a nutritive and reproductive power; in animals it is also a sensitive and locomotor power; in man it is as well the power of reason and thought.¹ The soul, as the sum of the powers of the body, cannot exist without it; the two are as form and wax, separable only in thought, but in reality one organic whole; the soul is not put into the body like the quicksilver inserted by Daedalus into the images of Venus to make "stand-ups" of them. A personal and particular soul can exist only in its own body. Nevertheless the soul is not material,

¹*De Anima*, ii.

as Democritus would have it; nor does it all die. Part of the rational power of the human soul is passive: it is bound up with memory, and dies with the body that bore the memory; but the "active reason," the pure power of thought, is independent of memory and is untouched with decay. The active reason is the universal as distinguished from the individual element in man; what survives is not the personality, with its transitory affections and desires, but mind in its most abstract and impersonal form.¹ In short, Aristotle destroys the soul in order to give it immortality; the immortal soul is "pure thought," undefiled with reality, just as Aristotle's God is pure activity, undefiled with action. Let him who can, be comforted with this theology. One wonders sometimes whether this metaphysical eating of one's cake and keeping it is not Aristotle's subtle way of saving himself from anti-Macedonian hemlock?

In a safer field of psychology he writes more originally and to the point, and almost creates the study of esthetics, the theory of beauty and art. Artistic creation, says Aristotle, springs

¹*De Anima*, ii, 4; i, 4; iii, 5.

from the formative impulse and the craving for emotional expression. Essentially the form of art is an imitation of reality; it holds the mirror up to nature.¹ There is in man a pleasure in imitation, apparently missing in lower animals. Yet the aim of art is to represent not the outward appearance of things, but their inward significance; for this, and not the external mannerism and detail, is their reality. There may be more human verity in the sternly classic moderation of the *Œdipus Rex* than in all the realistic tears of the *Trojan Women*.

The noblest art appeals to the intellect as well as to the feelings (as a symphony appeals to us not only by its harmonies and sequences but by its structure and development); and this intellectual pleasure is the highest form of joy to which a man can rise. Hence a work of art should aim at form, and above all at unity, which is the backbone of structure and the focus of form. A drama, e.g., should have unity of action: there should be no confusing sub-plots, nor any digressive episodes.² But

¹*Poetics*, i, 1447.

²Aristotle gives only one sentence to unity of time; and does not mention unity of place; so that the "three unities" commonly foisted upon him are later inventions (Norwood, *Greek Tragedy*, p. 42, note).

above all, the function of art is *catharsis*, purification: emotions accumulated in us under the pressure of social restraints, and liable to sudden issue in unsocial and destructive action, are touched off and sluiced away in the harmless form of theatrical excitement; so tragedy, "through pity and fear, effects the proper purgation of these emotions."¹ Aristotle misses certain features of tragedy (e. g., the conflict of principles and personalities); but in this theory of *catharsis* he has made a suggestion endlessly fertile in the understanding of the almost mystic power of art. It is an illuminating instance of his ability to enter every field of speculation, and to adorn whatever he touches.

VII. ETHICS AND THE NATURE OF HAPPINESS

And yet, as Aristotle developed, and young men crowded about him to be taught and formed, more and more his mind turned from the details of science to the larger and vaguer problems of conduct and character. It came to

¹*Poetics*, vi, 1449.

him more clearly that above all questions of the physical world there loomed the question of questions—what is the best life?—what is life's supreme good?—what is virtue?—how shall we find happiness and fulfilment?

He is realistically simple in his ethics. His scientific training keeps him from the preaching of superhuman ideals and empty counsels of perfection. "In Aristotle," says Santayana, "the conception of human nature is perfectly sound; every ideal has a natural basis, and everything natural has an ideal development." Aristotle begins by frankly recognizing that the aim of life is not goodness for its own sake, but happiness. "For we choose happiness for itself, and never with a view to anything further; whereas we choose honor, pleasure, intellect....because we believe that through them we shall be made happy."¹ But he realizes that to call happiness the supreme good is a mere truism; what is wanted is some clearer account of the nature of happiness, and the way to it. He hopes to find this way by asking wherein man differs from other beings; and by presuming that man's happiness will lie in

¹*Ethics*, i, 7.

the full functioning of this specifically human quality. Now the peculiar excellence of man is his power of thought; it is by this that he surpasses and rules all other forms of life; and as the growth of this faculty has given him his supremacy, so, we may presume, its development will give him fulfilment and happiness.

The chief condition of happiness, then, barring certain physical pre-requisites, is the life of reason—the specific glory and power of man. Virtue, or rather excellence,¹ will depend on clear judgment, self-control, symmetry of desire, artistry of means; it is not the possession of the simple man, nor the gift of innocent intent, but the achievement of experience in the fully developed man. Yet there is a road to it, a guide to excellence, which may save many detours and delays: it is the middle way, the golden mean. The qualities of character can be arranged in triads, in each of which the first

¹The word *excellence* is probably the fittest translation of the Greek *arete*, usually mistranslated *virtue*. The reader will avoid misunderstanding Plato and Aristotle if, where translators write *virtue*, he will substitute *excellence*, *ability*, or *capacity*. The Greek *arete* is the Roman *virtus*; both imply a masculine sort of excellence (*Ares*, god of war; *vir*, a male). Classical antiquity conceived virtue in terms of man, just as medieval Christianity conceived it in terms of woman.

and last qualities will be extremes and vices, and the middle quality a virtue or an excellence. So between cowardice and rashness is courage; between stinginess and extravagance is liberality; between sloth and greed is ambition; between humility and pride, is modesty; between secrecy and loquacity, honesty; between moroseness and buffoonery, good humor; between quarrelsomeness and flattery, friendship; between Hamlet's indecisiveness and Quixote's impulsiveness is self-control.¹ "Right," then, in ethics or conduct, is not different from "right" in mathematics or engineering; it means correct, fit, what works best to the best result. The golden mean, however, is not, like the mathematical mean, an exact average of two precisely calculable extremes; it fluctuates with the collateral circumstances of each situation, and discovers itself only to mature and flexible reason. Excellence is an art won by training and habituation: we do not act rightly because we have virtue or excellence, but we rather have these because we have acted rightly; "these virtues are formed in man by his doing the ac-

¹*Ethics*, i, 7.

tions";¹ we are what we repeatedly do. Excellence, then, is not an act but a habit: "the good of man is a working of the soul in the way of excellence in a complete life:....for as it is not one swallow or one fine day that makes a spring, so it is not one day or a short time that makes a man blessed and happy."²

Youth is the age of extremes: "if the young commit a fault it is always on the side of excess and exaggeration." The great difficulty of youth (and of many of youth's elders) is to get out of one extreme without falling into its opposite. For one extreme easily passes into the other, whether through "over-correction" or otherwise: insincerity doth protest too much, and humility hovers on the precipice of conceit.³ Those who are consciously at one extreme will give the name of virtue not to the mean but to the opposite extreme. Sometimes this is well; for if we are conscious of erring in one extreme "we should aim at the other, and so we may reach the middle position,.....as men

¹*Ethics*, ii, 4.

²*Ibid*, i, 7.

³"The vanity of Antishenes" the Cynic, said Plato, "peeps out through the holes in his cloak."

do in straightening bent timber.”¹ But unconscious extremists look upon the golden mean as the greatest vice; they “expel towards each other the man in the middle position; the brave man is called rash by the coward, and cowardly by the rash man, and in other cases accordingly”;² so in modern politics the “liberal” is called “conservative” and “radical” by the radical and the conservative.

It is obvious that this doctrine of the mean is the formulation of a characteristic attitude which appears in almost every system of Greek philosophy. Plato had had it in mind when he called virtue harmonious action; Socrates when he identified virtue with knowledge.³ The Seven Wise Men had established the tradition by engraving, on the temple of Apollo at Delphi, the motto *meden agan*,—nothing in excess. Perhaps, as Nietzsche claims,³ all these were attempts of the Greeks to check their own violence and impulsiveness of character; more truly, they reflected the Greek feeling that passions are not of themselves vices, but the raw

¹*Ethics*, ii, 9.

²*Ibid.*, ii, 8.

³*The Birth of Tragedy*.

material of both vice and virtue, according as they function in excess and disproportion, or in measure and harmony.¹

But the golden mean, says our matter-of-fact philosopher, is not all of the secret of happiness. We must have, too, a fair degree of worldly goods: poverty makes one stingy and grasping; while possessions give one that freedom from care and greed which is the source of aristocratic ease and charm. The noblest of these external aids to happiness is friendship. Indeed, friendship is more necessary to the happy than to the unhappy; for happiness is multiplied by being shared. It is more important than justice: for "when men are friends, justice is unnecessary; but when men are just, friendship is still a boon." "A friend is one soul in two bodies." Yet friendship implies few friends rather than many; "he who has many friends has no friend"; and "to be

¹Cf. a sociological formulation of the same idea: "Values are never absolute, but only relative. . . . A certain quality in human nature is deemed to be less abundant than it ought to be; therefore we place a value upon it, and . . . encourage and cultivate it. As a result of this valuation we call it a virtue; but if the same quality should become superabundant we should call it a vice and try to repress it."—Carver, *Essays in Social Justice*.

a friend to many people in the way of perfect friendship is impossible." Fine friendship requires duration rather than fitful intensity; and this implies stability of character; it is to altered character that we must attribute the dissolving kaleidoscope of friendship. And friendship requires equality; for gratitude gives it at best a slippery basis. "Benefactors are commonly held to have more friendship for the objects of their kindness than these for them.

The account of the matter which satisfies most persons is that the one are debtors and the others creditors,...and that the debtors wish their creditors out of the way, while the creditors are anxious that their debtors should be preserved." Aristotle rejects this interpretation; he prefers to believe that the greater tenderness of the benefactor is to be explained on the analogy of the artist's affection for his work, or the mother's for her child. We love that which we have made.¹

And yet, though external goods and relationships are necessary to happiness, its essence remains within us, in rounded knowledge and

¹*Ethics*, viii and ix.

clarity of soul. Surely sense pleasure is not the way: that road is a circle; as Socrates phrased the coarser Epicurean idea, we scratch that we may itch, and itch that we may scratch. Nor can a political career be the way; for therein we walk subject to the whims of the people; and nothing is so fickle as the crowd. No, happiness must be a pleasure of the mind; and we may trust it only when it comes from the pursuit or the capture of truth. "The operation of the intellect...aims at no end beyond itself, and finds in itself the pleasure which stimulates it to further operation; and since the attributes of self-sufficiency, unweariedness, and capacity for rest,...plainly belong to this occupation, in it must lie perfect happiness."¹

Aristotle's ideal man, however, is no mere metaphysician. "He does not expose himself needlessly to danger, since there are few things for which he cares sufficiently; but he is willing, in great crises, to give even his life,—knowing that under certain conditions it is not worth while to live. He is of a disposition to do men service, though he is ashamed to have a service done to him. To confer a kindness is a

¹*Ethics*, x, 7.

mark of superiority; to receive one is a mark of subordination...He does not take part in public displays...He is open in his dislikes and preferences; he talks and acts frankly, because of his contempt for men and things...He is never fired with admiration, since there is nothing great in his eyes. He cannot live in complaisance with others, except it be a friend; complaisance is the characteristic of a slave.. He never feels malice, and always forgets and passes over injuries...He is not fond of talking...It is no concern of his that he should be praised, or that others should be blamed. He does not speak evil of others, even of his enemies, unless it be to themselves. His carriage is sedate, his voice deep, his speech measured; he is not given to hurry, for he is concerned about only a few things; he is not prone to vehemence, for he thinks nothing very important. A shrill voice and hasty steps come to a man through care...He bears the accidents of life with dignity and grace, making the best of his circumstances, like a skilful general who marshals his limited forces with all the strategy of war...He is his own best friend, and takes delight in privacy whereas the man of no virtue

or ability is his own worst enemy, and is afraid of solitude."¹

Such is the Superman of Aristotle.

VIII. POLITICS

1. COMMUNISM AND CONSERVATISM.

To so aristocratic an ethic there naturally follows (or was the sequence the other way?) a severely aristocratic political philosophy. It was not to be expected that the tutor of an emperor and the husband of a princess would have any exaggerated attachment to the common people, or even to the mercantile bourgeoisie; our philosophy is where our treasure lies. But further, Aristotle was honestly conservative because of the turmoil and disaster that had come out of Athenian democracy; like a typical scholar he longed for order, security, and peace; this, he felt, was no time for political extravaganzas. Radicalism is a luxury of stability; we may dare to change things only when things lie steady under our hands. And

¹*Ethics*, iv, 3.

in general, says Aristotle, "the habit of lightly changing the laws is an evil; and when the advantage of change is small, some defects whether in the law or in the ruler had better be met with philosophic toleration. The citizen will gain less by the change than he will lose by acquiring the habit of disobedience."¹ The power of the law to secure observance, and therefore to maintain political stability, rests very largely on custom; and "to pass lightly from old laws to new ones is a certain means of weakening the inmost essence of all law whatever."² "Let us not disregard the experience of ages: surely, in the multitude of years, these things, if they were good, would not have remained unknown."³

"These things," of course, means chiefly Plato's communistic republic. Aristotle fights the realism of Plato about universals, and the idealism of Plato about government. He finds many dark spots in the picture painted by the Master. He does not relish the barrack-like continuity of contact to which Plato apparently

¹*Politics*, ii, 8.

²*Ibid*, v. 8.

³*Ibid.*, ii, 5.

condemned his guardian philosophers; conservative though he is, Aristotle values individual quality, privacy, and liberty above social efficiency and power. He would not care to call every contemporary brother or sister, nor every elder person father or mother; if all are your brothers, none is; and "how much better it is to be the real cousin of somebody than to be a son after Plato's fashion!"¹ In a state having women and children in common, "love will be watery...Of the two qualities which chiefly inspire regard and affection—that a thing is your own, and that it awakens real love in you—neither can exist in such a state" as Plato's.²

Perhaps there was, in the dim past, a communistic society, when the family was the only state, and pasturage or simple tillage the only form of life. But "in a more divided state of society," where the division of labor into 'unequally important functions elicits and enlarges the natural inequality of men, communism breaks down because it provides no adequate incentive for the exertion of superior abilities. The stimulus of gain is necessary to

¹*Politics*, ii, 3.

²*Ibid.*, ii, 4.

arduous work; and the stimulus of ownership is necessary to proper industry, husbandry and care. When everybody owns everything nobody will take care of anything. "That which is common to the greatest number has the least attention bestowed upon it. Everyone thinks chiefly of his own, hardly ever of the public, interest."¹ And "there is always a difficulty in living together, or having things in common, but especially in having common property. The partnerships of fellow-travellers" (to say nothing of the arduous communism of marriage), "are an example to the point; for they generally fall out by the way, and quarrel about any trifle that turns up."²

"Men readily listen" to Utopias, "and are easily induced to believe that in some wonderful manner everybody will become everybody's friend, especially when some one is heard denouncing the evils now existing,...which are said to arise out of the possession of private property. These evils, however, arise from quite another source—the wickedness of human

¹*Politics*, ii, 3.

²*Ibid.*, ii, 5.

nature.”¹ “Political science does not make men, but must take them as they come from nature.”²

And human nature, the human average, is nearer to the beast than to the god. The great majority of men are natural dunces and sluggards; in any system whatever these men will sink to the bottom; and to help them with state subsidies is “like pouring water into a leaking cask.” Such people must be ruled in politics and directed in industry; with their consent if possible, without it if necessary. “From the hour of their birth some are marked out for subjection, and others for command.”³ “For he who can foresee with his mind is by nature intended to be lord and master; and he who can work only with his body is by nature a slave.”⁴

¹*Politics*. Note that conservatives are pessimists, and radicals are optimists, about human nature, which is probably neither so good nor so bad as they would like to believe, and may be not so much nature as early training and environment.

²*Ibid.*, i, 10.

³*Ibid.*, i, 5.

⁴*Ibid.*, i, 2. Perhaps *slave* is too harsh a rendering of *doulos*; the word was merely a frank recognition of a brutal fact which in our day is perfumed with talk about the dignity of labor and the brotherhood of man; in nothing do we so far surpass the ancients as in making phrases.

The slave is to the master what the body is to the mind; and as the body should be subject to the mind, so "it is better for all inferiors that they should be under the rule of a master."¹ "The slave is a tool with life in it, the tool is a lifeless slave." And then our hard-hearted philosopher, with a glimmer of possibilities which the Industrial Révolution has opened to our hands, writes for a moment with wistful hope: "If every instrument would accomplish its own work, obeying or anticipating the will of others,...if the shuttle would weave, or the plectrum touch the lyre, without a hand to guide them, then chief workmen would not need assistants, nor masters slaves."²

This philosophy typifies the Greek disdain for manual labor. Such work in Athens had not become so complicated as it is today, when the intelligence demanded in many manual trades is at times much greater than that required for the operations of the lower middle class, and even a college professor may look upon an automobile mechanic (in certain exigencies) as a very god; manual work was then merely

¹*Politics*, i, 5.

²*Ibid.*, i, 4.

manual, and Aristotle looked down upon it, from the heights of philosophy, as belonging to men without minds, as only fit for slaves, and fitting men only for slavery. Manual labor, he believes, dulls and deteriorates the mind, and leaves neither time nor energy for political intelligence; it seems to Aristotle a reasonable corollary that only persons of some leisure should have a voice in government.¹ "The best form of state will not admit mechanics to citizenship...At Thebes there was a law that no man could hold office who had not retired from business ten years before."² Even merchants and financiers are classed by Aristotle among slaves. "Retail trade is unnatural,... and a mode by which men gain from one another. The most hated sort of such exchange is...usury, which makes a gain out of money itself, and not from its natural use. For money was intended as an instrument of exchange, and as the mother of interest. This usury (*tokòs*), which means the birth of money from money,... is of all modes of gain the most

¹*Politics*, iii, 3; vii, 8.

²*Ibid.*, iii, 5.

unnatural.”¹ Money should not breed. Hence “the discussion of the theory of finance is not unworthy of philosophy; but to be engaged in finance, or in money-making, is unworthy of a free man.”²

2. MARRIAGE AND EDUCATION

Woman is to man as the slave to the master, the manual to the mental worker, the barbarian to the Greek. Woman is an unfinished man, left standing on a lower step in the scale of development.³ The male is by nature superior, and the female inferior; the one rules and the other is ruled; and this principle extends, of necessity, to all mankind.” Woman is weak of will, and therefore incapable of independence of character or position; her best

¹*Politics*, i, 10. This view influenced the medieval prohibition of interest.

²*Ibid.*, i, 11. Aristotle adds that philosophers could succeed in such fields if they cared to descend into them; and he proudly points to Thales, who, foreseeing a good harvest, bought up all the reapers in his city, and then, at harvest time, sold them at his own sweet price; whereupon Aristotle observes that the universal secret of great riches is the creation of a monopoly.

³*De Gen. Animalium*, ii, 3; *Hist. Animalium*, viii, 1; *Pol.*, i, 5. Cf. Weininger; and Meredith's “Woman will be the last thing civilized by man” (*Ordeal of Richard Fevre*, p. 1). It appears, however, that man was, (or will be) the last thing civilized by woman; for the great civilizing agencies are the family and a settled economic life; and both of these are the creations of woman.

condition is a quiet home life in which, while ruled by the man in her external relations, she may be in domestic affairs supreme. Women should not be made more like men, as in Plato's republic; rather the dissimilarity should be increased; nothing is so attractive as the different. "The courage of a man and that of a woman are not, as Socrates supposed, the same: the courage of a man is shown in commanding; that of a woman in obeying... As the poet says, 'Silence is a woman's glory.'"¹

Aristotle seems to suspect that this ideal enslavement of woman is a rare achievement for man, and that as often as not the sceptre is with the tongue rather than with the arm. As if to give the male an indispensable advantage, he advises him to defer marriage till the vicinity of thirty-seven, and then to marry a lass of some twenty years. A girl who is rounding the twenties is usually the equal of a man of thirty, but may perhaps be managed by a seasoned warrior of thirty-seven. What attracts Aristotle to this matrimonial mathematics is the consideration that two such disparate persons will lose their

¹*Politics*. i, 13.

reproductive power and passions at approximately the same time. "If the man is still able to beget children while the woman is unable to bear them, or *vice versa*, quarrels and differences will arise. . . . Since the time of generation is commonly limited within the age of seventy years in the man, and fifty in the woman, the commencement of their union should conform to these periods. The union of male and female when too young is bad for the creation of children; in all animals the offspring of the young are small and ill-developed, and generally female." Health is more important than love. Further, "it conduces to temperance not too marry too soon; for women who marry early are apt to be wanton; and in men too the bodily frame is stunted if they marry while they are growing."¹ These matters should not be left to youthful caprice, they should be under state supervision and control: the state should determine the minimum and maximum ages of marriages for each sex, the best seasons for conception, and the rate of increase in population. If the natural rate of

¹*Politics*, vii, 16. It is apparent that Aristotle has in mind only the temperance of women; the moral effect of deferred marriage upon men does not seem to agitate him.

increase is too high, the cruel practice of infanticide may be replaced by abortion; and "let abortion be procured before sense and life have begun."¹ There is an ideal number of population for every state, varying with its position and resources. "A state when composed of too few is not, as a state should be, self-sufficing; while if it has too many . . . it becomes a nation and not a state, and is almost incapable of constitutional government,"² or of ethnic or political unity. Probably anything in excess of a population of 10,000 is undesirable.

Education, too, should be in the hands of the state. "That which most contributes to the permanence of constitutions is the adaptation of education to the form of government. . . The citizen should be moulded to the form of government under which he lives."³ By state control of schools we might divert men from industry and trade to agriculture; and we might train men, while keeping property private, to open their possessions to discriminately common use. "Among good men, with respect to the use of property, the proverb will hold, that

¹*Politics*.

²*Ibid.*, vii, 4.

³*Ibid.*, v. 9; viii, 1..

'friends should have all things in common.'"¹ But above all the growing citizen must be taught obedience to law, else a state is impossible. "It has been well said that 'he who has never learned to obey cannot be a good commander.' . . . The good citizen should be capable of both." And only a state system of schools can achieve social unity amid ethnic heterogeneity; the state is a plurality which must be made into a unity and a community by education.² Let youth be taught, too, the great boon it has in the state, the unappreciated security which comes of social organization, the freedom that comes of law. "Man, when perfected, is the best of animals; but when isolated he is the worst of all; for injustice is more dangerous when armed, and man is equipped at birth with the weapon of intelligence, and with qualities of character, which he may use for the vilest ends. Wherefore if he have not virtue he is the most unholy and savage of animals, full of gluttony and lust." And only social control can give him virtue. Through speech man evolved society; through

¹*Politics*, vi, 4; ii, 5.

²*Ibid.*, iii, 4; ii, 5.

society, intelligence; through intelligence, order; and through order, civilization. In such an ordered state the individual has a thousand opportunities and avenues of development open to him which a solitary life would never give. "To live alone," then, "one must be either an animal or a god."¹

Hence revolution is almost always unwise; it may achieve some good, but at the cost of many evils, the chief of which is the disturbance, and perhaps the dissolution, of that social order and structure on which every political good depends. The direct consequences of revolutionary innovations may be calculable and salutary; but the indirect are generally incalculable, and not seldom disastrous. "They who take only a few points into account find it easy to pronounce judgment;" and a man can make up his mind quickly if he has only a little to make up. "Young men are easily deceived, for they are quick to hope." The suppression of long-established habits brings the overthrow of innovating governments because the old

¹*Politics*, i, 2. "Or," adds Nietzsche, who takes nearly all of his political philosophy from Aristotle, "one must be both—that is, a philosopher."

habits persist among the people; characters are not as easily changed as laws. If a constitution is to be permanent, all the parts of a society must desire it to be maintained. Therefore a ruler who would avoid revolution should prevent extremes of poverty and wealth,—“a condition which is most often the result of war;” he should (like the English) encourage colonization as an outlet for a dangerously congested population; and he should foster and practice religion. An autocratic ruler particularly “should appear to be earnest in the worship of the gods; for if men think that a ruler is religious and reveres the gods, they are less afraid of suffering injustice at his hands, and are less disposed to conspire against him, since they believe that the gods themselves are fighting on his side.”¹

3. DEMOCRACY AND ARISTOCRACY

With such safeguards in religion, in education, and in the ordering of family life, almost any of the traditional forms of government will serve. All forms have good and bad commingled in them, and are severally adapted to

¹*Politics*, iv, 5; ii, 9; v, 7; ii, 11.

various conditions. Theoretically, the ideal form of government would be the centralization of all political power in the one best man. Homer is right: "Bad is the lordship of many; let one be your ruler and master." For such a man law would be rather an instrument than a limit: "for men of eminent ability there is no law—they are themselves a law. Anyone would be ridiculous who should attempt to make laws for them; they would probably retort what, in the fable of Antisthenes, the lions said to the hares when, in the council of beasts, the latter began haranguing and claiming equality for all—"Where are your claws?"¹

But in practice, monarchy is usually the worst form of government, for great strength and great virtue are not near allied. Hence the best practicable polity is aristocracy, the rule of the informed and capable few. Government is too complex a thing to have its issues decided by number, when lesser issues are reserved for knowledge and ability. "As the

¹*Politics*, iii, 13. Aristotle probably had Alexander or Philip in mind while writing this passage, just as Nietzsche seems to have been influenced towards similar conclusions by the alluring career of Napoleon.

physician ought to be judged by the physician, so ought men in general to be judged by their peers. . . Now does not this same principle apply to elections? For a right election can only be made by those who have knowledge: a geometrician, e.g., will choose rightly in matters of geometry; or a pilot in matters of navigation. . .¹ So that neither the election of magistrates nor the calling of them to account should be entrusted to the many."

The difficulty with hereditary aristocracy is that it has no permanent economic base; the eternal recurrence of the *nouveaux riches* puts political office sooner or later at the disposal of the highest bidder. "It is surely a bad thing that the greatest offices . . . should be bought. The law which permits this abuse makes wealth of more account than ability, and the whole state becomes avaricious. For whenever the chiefs of the state deem anything honorable, the other citizens are sure to follow their example" (the "prestige imitation" of modern social psychology); "and where ability has not the first place there is no real aristocracy"²

¹*Politics*, iii, 11. Cf. the modern argument for "occupational representation."

²*Ibid.*, ii, 11.

Democracy is usually the result of a revolution against plutocracy. "Love of gain in the ruling classes tends constantly to diminish their number" (Marx's "elimination of the middle class"), "and so to strengthen the masses, who in the end set upon their masters and establish democracies." This "rule by the poor" has some advantages. "The people, though individually they may be worse judges than those who have special knowledge, are collectively as good. Moreover, there are some artists whose works are best judged not by themselves alone, but by those who do not possess the art; e.g., the user or master of a house will be a better judge of it than the builder; . . . and the guest will be a better judge of a feast than the cook."¹ And "the many are more incorruptible than the few; they are like the greater quantity of water which is less easily spoiled than a little. The individual is liable to be overcome by anger, or by some other passion, and then his judgment

¹*Politics*, iii, 15, 8, 11. In these passages we have a fair outline of a desirable amendment to democracy: administration by experts democratically chosen by occupational ballot, and pursuing ends determined by the whole community.

is necessarily perverted; but it is hardly to be supposed that a great number of persons would all get into a passion and go wrong at the same moment.”¹

Yet democracy is on the whole inferior to aristocracy.² For it is based on a false assumption of equality; it “arises out of the notion that those who are equal in one respect (e.g., in respect of the law) are equal in all respects; because men are equally free they claim to be absolutely equal.” The upshot is that ability is sacrificed to number, while numbers are manipulated by trickery. Because the people are so easily misled, and so fickle in their views, the ballot should be limited to the intelligent. What we need is a combination of aristocracy and democracy.

Constitutional government offers this happy union. It is not the best conceivable government—that would be an aristocracy of educa-

¹*Politics*, iii, 15. Tarde, *Le Bon* and other social psychologists assert precisely the contrary; and though they exaggerate the vices of the crowd, they might find better support than Aristotle in the behavior of the Athenian Assembly. 430-330 B. C.

²*Ibid.*, ii, 9.

tion—but it is the best possible state. “We must ask what is the best constitution for most states, and the best life for most men; neither assuming a standard of excellence which will be above ordinary persons, nor an education exceptionally favored by nature or circumstance, nor yet an ideal state which will be only an aspiration; but having in mind such a life as the majority will be able to share, and a form of government to which states in general can attain.” “It is necessary to begin by assuming a principle of general application, namely, that that part of the state which desires the continuance of the government must be stronger than that which does not;”¹ and strength consists neither in number alone, nor in property alone, nor in military or political ability alone, but in a combination of these, so that regard has to be taken of “freedom, wealth, culture and noble birth, as well as of mere numerical superiority.” Now where shall we find such an *economic* majority to support our constitutional government? Perhaps best in the middle class: here again we have the golden

¹*Politics*, iv, 11, 10.

mean, just as constitutional government itself would be a mean between democracy and aristocracy. Our state will be sufficiently democratic if the road to every office is open to all; and sufficiently aristocratic if the offices themselves are closed except to those who have traveled the road and arrived fully prepared. From whatever angle we approach our eternal political problem we monotonously reach the same conclusion: that the community should determine the ends to be pursued, but that only experts should select and apply the means; that choice should be democratically spread, but that office should be rigidly reserved for the equipped and winnowed best.

IX. CRITICISM

What shall we say of this philosophy? Perhaps nothing rapturous. It is difficult to be enthusiastic about Aristotle, because it was difficult for him to be enthusiastic about anything; and *si vis me flere, primum tibi*

flendum.¹ His motto is *nil admirari*—to admire or marvel at nothing; and we hesitate to violate his motto in his case. We miss in him the reforming zeal of Plato, the angry love of humanity which made the great idealist denounce his fellow-men. We miss the daring originality of his teacher, the lofty imagination, the capacity for generous delusion. And yet, after reading Plato, nothing could be so salutary for us as Aristotle's sceptic calm.

Let us summarize our disagreement. We are bothered, at the outset, with his insistence on logic. We want him to describe his ideal, and he describes a perfect syllogism; not content with that he makes his syllogism judge of our ideals. He thinks the syllogism a description of man's way of reasoning, whereas it merely describes man's way of dressing up his reasoning for the persuasion of another mind; he supposes that thought begins with premisses and seeks their conclusions, when actually thought begins with hypothetical conclusions and seeks their justifying premisses,—and seeks them best by the observation of particular events under

¹"If you wish me to weep you must weep first"—Horace (*Ars Poetica*) to actors and writers.

the controlled and isolated conditions of experiment. Yet how foolish we should be to forget that two thousand years have changed merely the incidentals of Aristotle's logic, that Occam and Bacon and Whewell and Mill and a hundred others have but found spots in his sun, and that Aristotle's creation of this new discipline of thought, and his firm establishment of its essential lines, remain among the lasting achievements of the human mind.

It is again the absence of experiment and fruitful hypothesis that leaves Aristotle's natural science a mass of undigested observations. His specialty is the collection and classification of data; in every field he wields his categories and produces catalogues. But side by side with this bent and talent for observation goes a Platonic addiction to metaphysics; this trips him up in every science, and inveigles him into the wildest presuppositions. Here indeed was the great defect of the Greek mind: it was not disciplined; it lacked limiting and steady traditions; it moved freely in an uncharted field, and ran too readily to theories and conclusions. So Greek philosophy leaped on to heights yet unreached again, while Greek

science limped behind. Our modern danger is precisely opposite; inductive data fall upon us from all sides like the lava of Vesuvius; we suffocate with uncoördinated facts; our minds are overwhelmed with sciences breeding and multiplying into specialistic chaos for want of synthetic thought and a unifying philosophy. We are all mere fragments of what a man might be.

Aristotle's ethics is a branch of his logic: the ideal life is like a proper syllogism. He gives us a handbook of propriety rather than a stimulus to improvement. An ancient critic spoke of him as "moderate to "excess." An extremist might call the *Ethics* the champion collection of platitudes in all literature; and an Anglophobe would be consoled with the thought that Englishmen in their youth had done advance penance for the imperialistic sins of their adult years, since both at Cambridge and at Oxford they had been compelled to read every word of the Nicomachean Ethics. One longs to mingle fresh green *Leaves of Grass* with these drier - pages, to add Whitman's exhilarating justification of sense joy to Aristotle's exaltation of a purely intellectual happiness. One won-

ders if this Aristotelian ideal of immoderate moderation has had anything to do with the colorless virtue, the starched perfection, the expressionless good form, of the British aristocracy. Matthew Arnold tells us that in his time Oxford tutors looked upon the *Ethics* as infallible. For three hundred years this book and the *Politics* have formed the ruling British mind, perhaps to great and noble achievements, but certainly to a hard and cold efficiency: one wonders what the result would have been if the masters of the greatest of empires had been nurtured, instead, on the holy fervor and the constructive passion of the *Republic*.

After all, Aristotle was not quite Greek; he had been settled and formed before coming to Athens; there was nothing Athenian about him, nothing of the hasty and inspiriting experimentalism which made Athens throb with political *élan* and at last helped to subject her to a unifying despot. He realized too completely the Delphic command to avoid excess: he is so anxious to pare away extremes that at last nothing is left. He is so fearful of disorder that he forgets to be fearful of slavery; he is so timid of uncertain change that he pre-

fers a certain changelessness that near resembles death. He lacks that Heraclitean sense of flux which justifies the conservative in believing that all permanent change is gradual but justifies the radical in believing that no changelessness is permanent. He forgets that Plato's communism was meant only for the élite, the unselfish and ungreedy few; and he comes deviously to a Platonic result when he says that though property should be private its use should be as far as possible common. He does not see (and perhaps he could not be expected in his early day to see) that private control of the means of production was stimulating and salutary only when these means were so simple as to be purchasable by any man; and that their increasing complexity and cost lead to a dangerous centralization of ownership and power, and to an artificial and finally disruptive inequality.

But after all, these are quite inessential criticisms of what remains the most marvelous and influential system of thought ever put together by any single mind. It may be doubted if any other thinker has contributed so much to the enlightenment of the world. Ever

later age has drawn upon Aristotle, and stood upon his shoulders to see the truth. The varied and magnificent culture of Alexandria found its scientific inspiration in him. His *Organon* played a central rôle in shaping the minds of the medieval barbarians into disciplined and consistent thought. The other works, translated by Nestorian Christians into Syriac in the fifth century A. D., and thence into Arabic and Hebrew in the tenth century, and thence into Latin towards 1225, turned scholasticism from its eloquent beginnings in Abélard to encyclopedic completion in Thomas Aquinas (1227-1274). The Crusaders brought back more accurate Greek copies of the philosopher's texts; and the Greek scholars of Constantinople brought further Aristotelian treasures with them when, after 1453, they fled from the besieging Turks. The works of Aristotle came to be for European philosophy what the Bible was for theology—an almost infallible text, with solutions for every problem. In 1215 the Papal legate at Paris forbade teachers to lecture on his works; in 1231 Gregory IX appointed a commission to expurgate him; by 1260 he was *de rigueur* in every Christian school, and

ecclesiastical assemblies penalized deviations from his views. Chaucer describes his student as happy by having

At his beddes hed
Twenty bookes clothed in blake, or red ,
Of Aristotle and his philosophie;¹

and in the first circles of Hell, says Dante,

“I saw the Master there of those who know,
Amid the philosophic family,
By all admired, and by all revered;
There Plato too I saw, and Socrates,
Who stood beside him closer than the rest.”

Such lines give us some inkling of the honor which a thousand years offered to the Stagirite. Not till new instruments, accumulated observations, and patient experiments remade science and gave irresistible weapons to Occam and Ramus, to Rôger and Francis Bacon, was the reign of Aristotle ended. No other mind had for so long a time ruled the intellect of mankind.

¹Quoted by Benn, i, 276.

²*Inferno*, iv, 131f.

X. LATER LIFE AND DEATH

Meanwhile life had become unmanageably complicated for our philosopher. He found himself on the one hand embroiled with Alexander for protesting against the execution of Calisthenes (a nephew of Aristotle), who had refused to worship Alexander as a god; and Alexander had answered the protest by hinting that it was quite within his omnipotence to put even philosophers to death. At the same time Aristotle was busy defending Alexander among the Athenians. He preferred Greek solidarity to city patriotism, and thought culture and science would flourish better when petty sovereignties and disputes were ended; and he saw in Alexander what Goethe was to see in Napoleon—the philosophic unity of a chaotic and intolerably manifold world. The Athenians, hungering for liberty, growled at Aristotle, and became bitter when Alexander had a statue of the philosopher put up in the heart of the hostile city. In this turmoil we get an impression of Aristotle quite contrary to that left upon us by his *Ethics*: here is a man

not cold and inhumanly calm, but a fighter, pursuing his Titanic work in a circle of enemies on every side. The successors of Plato at the Academy, the oratorical school of Isocrates, and the angry crowds that hung on Demosthenes' acid eloquence, intrigued and clamored for his exile or his death.

And then, suddenly (323 B. C.), Alexander died. Athens went wild with patriotic joy; the Macedonian party was overthrown, and Athenian independence was proclaimed. Antipater, successor of Alexander and intimate friend of Aristotle, marched upon the rebellious city. Most of the Macedonian party fled. Eurymedon, a chief priest, brought in an indictment against Aristotle, charging him with having taught that prayer and sacrifice were of no avail. Aristotle saw himself fated to be tried by juries and crowds incomparably more hostile than those that had murdered Socrates. Very wisely, he left the city, saying that he would not give Athens a chance to sin a second time against philosophy. There was no cowardice in this; an accused person at Athens had always the option of preferring exile.¹

CHAIRMAN'S INTRODUCTORY ADDRESS BY WILLIAM ARCHER

In the far-off, almost fabulous, Golden Age before the War, I once attended a lecture by our speaker of tonight, Professor Gilbert Murray. It was a most entertaining and instructive lecture; but what I chiefly learned on that occasion was a lesson I hope never to forget—as to the duties of a Chairman. Nothing would tempt me to reveal who the Chairman was: I will only say that I don't think he has ever figured, or ever will figure, on this platform. His speech was a conspicuous and masterly example of how not to do it. He began by confessing that he knew nothing of Professor Murray's subject, but went on to explain that he had read it up for the occasion in an Encyclopedia; and thereupon he retailed at great length, and in a most lugubrious fashion, the information he had gleaned from that work of reference. There happened to be two or three anecdotes, manifestly the plums of the subject; and the Chairman must needs put in his thumb

and pull out those plums, and spoil them for the lecturer by serving them up with consummate insipidity. What Professor Murray must have suffered in having his subject thus broken on the wheel, I shudder even now to think. His conduct was certainly a noble example of Stoicism. Had I been in his place, I should infallibly have risen up and slain that Chairman, and claimed from a jury of my countrymen a verdict of "Served him right!"

The lesson of that occasion was burnt into my soul; so Professor Murray need not fear that I am going to pour out to you the stores of my erudition on the subject of the Stoics. No doubt, half an hour with the Encyclopedia Britannica would have supplied me with some capital anecdotes of Zeno, and Epictetus, and Marcus Aurelius; but I have sternly averted my face from temptation. The ideal Chairman as I conceive him, ought to emulate as nearly as possible the ideal child, who is "seen but not heard." If I fall away from that ideal, it is only to express my belief that there is no man in England whom Moncure Conway, were he alive, would more warmly welcome to this platform than our speaker of tonight. His presence here is a proof that that large-minded humanism for which Conway stood and strove

is making extraordinary progress even in our apparently slow-moving England. For Professor Murray, as you all know, is not a biologist, not a physicist, not a chemist. He has not pursued any of those studies of cause and effect which were supposed, in the Victorian era, to lead to perilous enlightenment—and did, in fact, lead to enlightenment, whether perilous or not. He is not even a mathematician, hardened in the audacious heresy that two and two make four. No, his life-work has lain among those *literae humaniores* which have so often been associated, in the past, with violent Toryism in politics and dense obscurantism in thought. He does not come to us from godless London University, nor even from Cambridge with its mildly Whiggish proclivities. He is a son, and a very loyal son, of Oxford; but he has known how to absorb the best of her culture—if I may use a somewhat discredited word—without drinking in either her prejudices or her snobbishness or her cowardices. I suppose we may take Matthew Arnold as a type of Oxford enlightenment in the last generation, and I am far from undervaluing his work or his influence; but imagine Matthew Arnold coming down to address us here to-

night! Or think of Pater! Think of the vague and vaporous aesthetic paganism which was all that Pater could extract from the spiritual sustenance offered him by Oxford! Professor Murray, as we know, occupies one of the greatest positions in English scholarship; but while he is eminently a scholar among scholars, he is preeminently a man among men. His imagination and insight, working upon a solid basis of knowledge, give him an extraordinary power—as no doubt he will show you tonight—of revivifying Greek thought and experience, and making it human and real to us. Ancient Greece is not, to him, a picturesque phenomenon to be contemplated under a glass case, but an absorbing chapter in the story of humanity, full of vital meanings for the present and for the future. What has specially attracted him to Euripides, we may be sure, is, in the last analysis, neither his lyric splendor nor his dramatic subtlety, but his daring rationalism and his passionate resentment of the stupidities and cruelties which are summed up in the phrase “man’s inhumanity to man.” These cruelties, these stupidities, are always with us, more or less, and are, as we know to our cost, liable to frightful recrudescences. No one is more resolute in combating them than Profes-

sor Murray. He is one of our foremost champions of reason and humanity. I am sure that Moncure Conway would warmly have appreciated the consistency, the sincerity, and the courage of his intellectual attitude, and would especially have welcomed it as a product of modern Oxford.

For Professor Murray does not stand alone. He is one of a group of scholars, his contemporaries and his juniors, who are converting Oxford from a home of lost causes into a Great Headquarters for causes yet to be won. Is it not a most encouraging sign of the times that that admirable series, the Home University Library, should be edited by two New College dons, Professor Murray and Mr. Herbert Fisher, now Vice Chancellor of Sheffield University? What would Moncure Conway have said if any one had predicted that, within seven years of his death, such a book as Professor Bury's "History of Freedom of Thought" would be written by the Regius Professor of History at Cambridge, and published under the editorship of the Regius Professor of Greek at Oxford? I think he would have said: "No, no; the world does not move so quickly as that!" But it does move; it has moved; and I am optimist enough to hope that the present out-

burst of colossal unreason, alleged to be under the patronage of God, may in the end promote the cause of reason, or at any rate may not involve any intellectual set-back. With that hope in view, let us not cease to fight the good fight of spiritual illumination.

I now call upon Professor Murray.

THE STOIC PHILOSOPHY.

BY PROFESSOR GILBERT MURRAY.

I feel a peculiar pleasure in being asked to give this address in commemoration of Moncure D. Conway. I knew Mr. Conway but slightly. But when I was a boy and struggling with religious difficulties his books were among those which brought me both comfort and liberation. And all those who in our generation are stirred either by their doubts or their convictions to a consciousness of duties not yet stamped by the approval of their community, may well recognize him as one of their guiding beacons. His character is written large in the history of his life. Few men of our time have been put so clearly to the test and so unhesitatingly sacrificed their worldly interests to their consciences. This strain of heroic quality, which lay beneath Mr. Conway's unpretentious kindness and easy humor, makes, I think, the subject of my address this evening not inappropriate to his memory.

I wish in this lecture to give in rough out-

line some account of the greatest system of organized thought which the mind of man had built up for itself in the Graeco-Roman world before the coming of Christianity with its inspired book and its authoritative revelation. Stoicism may be called either a philosophy or a religion. It was a religion in its exalted passion; it was a philosophy inasmuch as it made no pretense to magical powers or supernatural knowledge. I do not suggest that it is a perfect system, with no errors of fact and no inconsistencies of theory. It is certainly not that; and I do not know of any system that is. But I believe that it represents a way of looking at the world and the practical problems of life which possesses still a permanent interest for the human race, and a permanent power of inspiration. I shall approach it, therefore, rather as a psychologist than as a philosopher or historian. I shall not attempt to trace the growth or variation of Stoic doctrine under its various professors, nor yet to scrutinize the logical validity of its arguments. I shall merely try as best I can to make intelligible its great central principles and the almost irresistible appeal which they made to so many of the best minds of antiquity.

From this point of view I will begin by a very rough general suggestion—viz., that the religions known to history fall into two broad classes, religions which are suited for times of good government and the religions which are suited for times of bad government; religions for prosperity or for adversity, religions which accept the world or which defy the world, which place their hopes in the betterment of human life on this earth or which look away from it as from a vale of tears. By “the world” in this connection I mean the ordinary concrete world, the well-known companion of the flesh and the Devil; not the universe. For some of the religions which think most meanly of the world they know have a profound admiration for all, or nearly all, those parts of the universe where they have not been.

Now, to be really successful in the struggle for existence, a religion must suit both sets of circumstances. A religion which fails in adversity, which deserts you just when the world deserts you, would be a very poor affair; on the other hand, it is almost equally fatal for a religion to collapse as soon as it is successful. Stoicism, like Christianity, was prim-

arily a religion for the oppressed, a religion of defense and defiance; but, like Christianity, it had the requisite power of adaptation. Consistently, it opened its wings to embrace the needs both of success and of failure. To illustrate what I mean—contrast for a moment the life of an active, practical, philanthropic, modern Bishop with that of an anchorite like St. Simeon Stylites, living in idleness and filth on the top of a large column; or, again, contrast the Bishop's ideals with those of the author of the Apocalypse, abandoning himself to visions of a gorgeous reversal of the order of this evil world and the bloody revenges of the blessed. All three are devout Christians; but the Bishop is working with the world of men, seeking its welfare and helping its practical needs; the other two are rejecting or cursing it. In somewhat the same way we shall find that our two chief preachers of Stoicism are, the one a lame and penniless slave to whom worldly success is as nothing, the other an Emperor of Rome, keenly interested in good administration.

The founder of the Stoic school, Zeno, came from Cilicia to Athens about the year 320 B. C. His place of birth is, perhaps, sig-

nificant. He was a Semite, and came from the East. The Semite was apt in his religion to be fierier and more uncompromising than the Greek. The time of his coming is certainly significant. It was a time when landmarks had collapsed, and human life was left, as it seemed, without a guide. The average man in Greece of the fifth century B. C. had two main guides and sanctions for his conduct of life: the welfare of his city and the laws and traditions of his ancestors. First the city, and next the traditional religion; and in the fourth century both of these had fallen. Let us see how.

Devotion to the city or community produced a religion of public service. The city represented a high ideal, and it represented supreme power. By 320 B. C. the supreme power had been overthrown. Athens, and all independent Greek cities, had fallen before the overwhelming force of the great military monarchies of Alexander and his generals. The high ideal at the same time was seen to be narrow. The community to which a man should devote himself, if he should devote himself at all, must surely be something larger than one of these walled cities set upon their separate hills.

Thus the city, as a guide of life, had proved wanting. Now when the Jews lost their Holy City they had still, or believed that they had still, a guide left. "Zion is taken from us," says the Book of Esdras; "nothing is left save the Holy One and His Law." But Greece had no such law. The Greek religious tradition had long since been riddled with criticism. It would not bear thinking out, and the Greeks liked to think things out. The traditional religion fell not because the people were degenerate. Quite the contrary; it fell, as it has sometimes fallen elsewhere, because the people were progressive. The people had advanced, and and the traditional religion had not kept pace with them. And we may add another consideration. If the Gods of tradition had proved themselves capable of protecting their worshippers, doubtless their many moral and intellectual deficiencies might have been overlooked. But they had not. They had proved no match for Alexander and the Macedonian phalanx.

Thus the work that lay before the generation of 320 B. C. was twofold. They had to rebuild a new public spirit, devoted not to the city, but to something greater; and they

had to rebuild a religion or philosophy which should be a safe guide in the threatening chaos. We will see how Zeno girded himself to the task.

Two questions lay before him—how to live and what to believe. His real interest was in the first, but it could not be answered without first facing the second. For if we do not in the least know what is true or untrue, real or unreal, we cannot form any reliable rules about conduct or anything else. And, as it happened, the Sceptical school of philosophy, largely helped by Plato, had lately been active in denying the possibility of human knowledge and throwing doubt on the very existence of reality. Their arguments were extraordinarily good, and many of them have not been answered yet; they affect both the credibility of the senses and the supposed laws of reasoning. The Sceptics showed how the senses are notoriously fallible and contradictory, and how the laws of reasoning lead by equally correct processes to opposite conclusions. Many modern philosophers, from Kant to Dr. Schiller and Mr. Bertrand Russell, have followed respectfully in their footsteps. But Zeno had

no patience with this sort of thing. He wanted to get to business.

Also he was a born fighter. His dealings with opponents who argued against him always remind me of a story told of the Duke of Wellington when his word was doubted by a subaltern. The Duke, when he was very old and incredibly distinguished, was telling how once, at mess in the Peninsula, his servant had opened a bottle of port, and inside found a rat. "It must have been a very large bottle," remarked the subaltern. The Duke fixed him with his eye. "It was a damned small bottle." "Oh," said the subaltern, abashed; "then no doubt it was a very small rat." "It was a damned large rat," said the Duke. And there the matter has rested ever since.

Zeno began by asserting the existence of the real world. "What do you mean by real?" asked the Sceptic. "I mean solid and material. I mean that this table is solid matter." "And God," said the Sceptic, "and the soul? Are they solid matter?" "Perfectly solid," says Zeno; "more solid, if anything, than the table." "And virtue or justice or the Rule of Three; also solid matter?" "Of course," said Zeno; "quite solid." This is what may be

called "high doctrine," and Zeno's successors eventually explained that their master did not really mean that justice was solid matter, but that it was a sort of "tension," or mutual relation, among material objects. This amendment saves the whole situation. But it is well to remember the uncompromising materialism from which the Stoic system started.

Now we can get a step further. If the world is real, how do we know about it? By the evidence of our senses; for the sense impression (here Stoics and Epicureans both followed the fifth century physicists) is simply the imprint of the real thing upon our mindstuff. As such it must be true. In the few exceptional cases where we say that "our senses deceive us" we speak incorrectly. The sense impression was all right; it is we who have interpreted it wrongly, or received it in some incomplete way. What we need in each case is a "comprehensive sense impression." The meaning of this phrase is not quite clear. I think it means a sense impression which "grasps" its object; but it may be one which "grasps" us, or which we "grasp," so that we cannot doubt it. In any case, when we get the real imprint of the object upon our senses,

then this imprint is of necessity true. When the Sceptics talk about a conjurer making "our senses deceive us," or when they object that a straight stick put half under water looks as if it were bent in the middle, they are talking inexactly. In such cases the impression is perfectly true; it is the interpretation that may go wrong. Similarly, when they argue that reasoning is fallacious because men habitually make mistakes in it, they are confusing the laws of reasoning with the inexact use which people make of them. You might just as well say that twice two is not four, or that 7×7 is not 49, because people often make mistakes in doing arithmetic.

Thus we obtain a world which is in the first place real and in the second knowable. Now we can get to work on our real philosophy, our doctrine of ethics and conduct. And we build it upon a very simple principle, laid down first by Zeno's master, Crates, the founder of the Cynic School: the principle that Nothing but Goodness is Good. That seems plain enough, and harmless enough; and so does its corollary: "Nothing but badness is bad." In the case of any concrete object which you call "good," it seems quite clear that it is only good because of some

goodness in it. We, perhaps, should not express the matter in quite this way, but we should scarcely think it worth while to object if Zeno chooses to phrase it so, especially as the statement itself seems little better than a truism.

Now, to an ancient Greek the form of the phrase was quite familiar. He was accustomed to asking, "What is the good?" It was to him the central problem of conduct. It meant: "What is the object of life, or the element in things which makes them worth having?" Thus the principle will mean: "Nothing is worth living for except goodness." The only good for man is to be good. And, as we might expect, when Zeno says "good" he means good in an ultimate Day-of-Judgment sense, and will take no half measures. The principle turns out to be not nearly so harmless as it looked. It begins by making a clean sweep of the ordinary conventions. You remember the eighteenth century lady's epitaph which ends: "Bland, passionate, and deeply religious, she was second cousin to the Earl of Leitrim, and of such are the kingdom of heaven." One doubts whether, when the critical moment came, her relationships would really prove as important as her executors

hoped; and it is the same with all the conventional goods of the world when brought before the bar of Zeno. Rank, riches, social distinction, health, pleasure, barriers of race or nation—what will those things matter before the tribunal of ultimate truth? Not a jot. Nothing but goodness is good. It is what you are that matters—what you yourself are; and all these things are not you. They are external; they depend not on you alone, but on other people. The thing that really matters depends on you, and on none but you. From this there flows a very important and surprising conclusion. You possess already, if you only knew it, all that is worth desiring. The good is yours if you but will it. You need fear nothing. You are safe, inviolable, utterly free. A wicked man or an accident can cause you pain, break your leg, make you ill; but no earthly power can make you good or bad except yourself, and to be good or bad is the only thing that matters.

At this point common sense rebels. The plain man says to Zeno: "This is all very well; but we know as a matter of fact that such things as health, pleasure, long life, fame, etc., are good; we all like them. The

reverse are bad; we hate and avoid them. All sane, healthy people agree in judging so." Zeno's answer is interesting. In the first place, he says: "Yes; that is what most people say. But the judges who give that judgment are bribed. Pleasure, though not really good, has just that particular power of bribing the judges, and making them on each occasion say or believe that she is good. The Assyrian king Sardanapalus thinks it good to stay in his harem, feasting and merry-making, rather than suffer hardship in governing his kingdom. He swears his pleasure is good; but what will any unbribed third person say? Consider the judgments of history. Do you ever find that history praises a man because he was healthy, or long-lived, or because he enjoyed himself a great deal? History never thinks of such things; they are valueless and disappear from the world's memory. The thing that lives is a man's goodness, his great deeds, his virtue, or his heroism."

If the questioner was not quite satisfied, Zeno used another argument. He would bid him answer honestly for himself: "Would you yourself really like to be rich and corrupted? To have abundance of pleasure and

be a worse man?" And, apparently, when Zeno's eyes were upon you, it was difficult to say you would. Some Stoics took a particular instance. When Harmodius and Aristogeiton, the liberators of Athens, slew the tyrant Hipparchus (which is always taken as a praiseworthy act), the tyrant's friends seized a certain young girl, named Leaina, who was the mistress of Aristogeiton, and tortured her to make her divulge the names of the conspirators. And under the torture the girl bit out her tongue and died without speaking a word. Now, in her previous life we may assume that Leaina had had a good deal of gaiety. Which would you sooner have as your own—the early life of Leaina, which was full of pleasures, or the last hours of Leaina, which were full of agony? And with a Stoic's eyes upon them, as before, people found it hard to say the first. They yielded their arms and confessed that goodness, and not any kind of pleasure, is the good.

But now comes an important question, and the answer to it, I will venture to suggest, just redeems Stoicism from the danger of becoming one of those inhuman cast-iron systems by which mankind may be browbeaten, but against which it secretly rebels. What is

Goodness? What is this thing which is the only object worth living for?

Zeno seems to have been a little impatient of the question. We know quite well; everybody knows who is not blinded by passion or desire. Still, the school consented to analyze it. And the profound common sense and reasonableness of average Greek thought expressed the answer in its own characteristic way. Let us see in practice what we mean by "good." Take a good bootmaker, a good father, a good musician, a good horse, a good chisel; you will find that each one of them has some function to perform, some special work to do; and a good one does the work well. Goodness is performing your function well. But when we say "well" we are still using the idea of goodness. What do we mean by doing it "well"? Here the Greek falls back on a scientific conception which had great influence in the fifth century B. C., and somewhat transformed and differently named, has regained it in our own days. We call it "Evolution." The Greeks called it *Phusis*, a word which we translate by "Nature," but which seems to mean more exactly "growth," or "the process of growth."* It is *Phusis* which gradually shapes or tries to shape every living

thing into a more perfect form. It shapes the seed, by infinite and exact gradations, into the oak; the blind puppy into the good hunting dog; the savage tribe into the civilized city. If you analyze this process, you find that Physis is shaping each thing towards the fulfillment of its own function—that is, towards the good. Of course Physis sometimes fails; some of the blind puppies die; some of the seeds never take root. Again, when the proper development has been reached, it is generally followed by decay; that, too, seems like a failure in the work of Physis. I will not consider these objections now; they would take us too far afield; and we shall need a word about them later. Let us in the meantime accept this conception of a force very like that which most of us assume when we speak of evolution; especially, perhaps, it is like what Bergson calls *La Vie* or *L'Elan Vital* at the back of *L'Evolution Creatrice*, though to the Greek it seemed still more personal and vivid; a force which is present in all the live world, and is always making things grow towards the fulfillment of their utmost capacity. We seen now what goodness is; it is living or acting according to Physis, working with Physis

in her eternal effort towards perfection. You will notice, of course, that the phrase means a good deal more than we usually mean by living "according to nature." It does not mean "living simply," or "living like the natural man." It means living according to the spirit which makes the world grow and progress.

This Phusis becomes in Stoicism the center of much speculation and much effort at imaginative understanding. It is at work everywhere. It is like a soul, or a life-force, running through all matter as the "soul" or life of a man runs through all his limbs. It is the soul of the world. Now, it so happened that in Zeno's time the natural sciences had made a great advance, especially Astronomy, Botany, and Natural History. This fact had made people familiar with the notion of natural law. Law was a principle which ran through all the movements of what they called the Kosmos, or "ordered world." Thus Phusis, the life of the world, is, from another point of view, the Law of Nature; it is the great chain of causation by which all events occur; for the Phusis which shapes things towards their end acts always by the laws of causation.

Phusis is not a sort of arbitrary personal goddess, upsetting the natural order; Phusis is the natural order, and nothing happens without a cause.

A natural law, yet a natural law which is alive, which is itself life. It becomes indistinguishable from a purpose, the purpose of the great world-process. It is like a fore-seeing, fore-thinking power—Pronoia; our common word "Province" is the Latin translation of this Pronoia, though of course its meaning has been rubbed down and cheapened in the process of the ages. As a principle of providence or forethought it comes to be regarded as God, the nearest approach to a definite personal God which is admitted by the austere logic of Stoicism. And, since it must be in some sense material, it is made of the finest material there is; it is made of fire—not ordinary fire, but what they called intellectual fire. A fire which is present in a warm, live man, and not in a cold, dead man; a fire which has consciousness and life, and is not subject to decay. This fire, Phusis, God, is in all creation.

We are led to a very definite and complete Pantheism. The Sceptic begins to make his usual objections. "God in worms?" he asks.

"God in fleas and dung beetles?" And, as usual, the objector is made to feel sorry that he spoke. "Why not?" the Stoic answers; "cannot an earthworm serve God? Do you suppose that it is only a general who is a good seldier? Cannot the lowest private or camp attendant fight his best and give his life for his cause? Happy are you if you are serving God, and carrying out the great purpose as truly as such-and-such an earthworm?" That is the conception. All the world is working together. It is all one living whole, with one soul through it. And, as a matter of fact, no single part of it can either rejoice or suffer without all the rest being affected. The man who does not see that the good of every living creature is his good, the hurt of every living creature his hurt, is one who wilfully makes himself a kind of outlaw or exile; he is blind, or a fool. So we are led up to the great doctrine of the later Stoics, the Sympathy of the Whole; a grand conception, the truth of which is illustrated in the ethical world by the feelings of good men, and in the world of natural science. . . . We moderns may be excused for feeling a little surprised . . . by the fact that the stars twinkle. It is because they

are so sorry for us: as well they may be!

Thus Goodness is acting, according to Phusis, in harmony with the will of God. But here comes an obvious objection. If God is all, how can any one do otherwise? God is the omnipresent Law; God is all Nature; no one can help being in harmony with him. The answer is that God is in all except in the doings of bad men. For man is free . . . How do we know that? Why, by a kataleptike phantasia, a comprehensive sense impression which it is impossible to resist. Why it should be so we cannot tell. "God might have preferred chained slaves for his fellow-workers; but, as a matter of fact, he preferred free men." Man's soul, being actually a portion of the divine fire, has the same freedom that God himself has. He can act either with God or against him, though, of course, when he acts against him he will ultimately be overwhelmed. Thus Stoicism grapples with a difficulty which no religion has satisfactorily solved.

You will have observed that by now we have worked out two quite different types of Stoic—one who defies the world and one who works with the world; and, as in Christianity, both types are equally orthodox. We have

first the scorner of all earthly things. Nothing but goodness is good; nothing but badness bad. Pain, pleasure, health, sickness, human friendship and affection, are all indifferent. The truly wise man possesses his soul in peace; he communes with God. He always, with all his force, wills the will of God; thus everything that befalls him is a fulfillment of his own will and good. A type closely akin to the early Christian ascetic or the Indian saint.

And in the second place we have the man who, while accepting the doctrine that only goodness is good, lays stress upon the definition of goodness. It is acting according to *Phusis*, in the spirit of that purpose or forethought which, though sometimes failing, is working always unrestingly for the good of the world, and which needs its fellow workers. God is helping the whole world; you can only help a limited fraction of the world. But you can try to work in the same spirit. There were certain old Greek myths which told how *Heraclēs* and other heroes had passed laborious lives serving and helping humanity, and in the end became gods. The Stoics used such myths as allegories. That was the way to heaven; that was how a man may at the end

of his life become not a dead body, but a star. In the magnificent phrase which Pliny translates from a Greek Stoic, God is that, and nothing but that; man's true God is the helping of man; Deus est mortali invare mortalem.

No wonder such a religion appealed to kings and statesmen and Roman governors. Nearly all the successors of Alexander—we may say all the principal kings in existence in the generations following Zeno—professed themselves Stoics. And the most famous of all Stoics, Marcus Aurelius, found his religion not only in meditation and religious exercises, but in working some sixteen hours a day for the good practical government of the Roman Empire.

Is there any real contradiction or inconsistency between the two types of Stoic virtue? On the surface certainly there seems to be; and the school felt it, and tried in a very interesting way to meet it. The difficulty is this: what is the good of working for the welfare of humanity if such welfare is really worthless? Suppose, by great labor and skill, you succeed in reducing the death rate of a plague-stricken area; suppose you make a starving countryside prosperous; what is the good of it all if health and riches are in themselves worthless,

and not a whit better than disease and poverty?

The answer is clear and uncompromising. A good bootmaker is one who makes good boots; a good shepherd is one who keeps his sheep well; and even though good boots are, in the Day-of-Judgment sense, entirely worthless, and fat sheep no whit better than starved sheep, yet the good bootmaker or good shepherd must do his work well or he will cease to be good. To be good he must perform his function; and in performing that function there are certain things that he must "prefer" to others, even though they are not really "good." He must prefer a healthy sheep or a well-made boot to their opposites. It is thus that Nature, or Physis, herself works when she shapes the seed into the tree, or the blind puppy into the good hound. The perfection of the tree or hound is in itself indifferent, a thing of no ultimate value. Yet the goodness of Nature lies in working for that perfection.

Life becomes, as the Stoics more than once tell us, like a play which is acted or a game played with counters. Viewed from outside, the counters are valueless; but to those engaged in the game their importance is para-

mount. What really and ultimately matters is that the game shall be played as it should be played. God, the eternal dramatist, has cast you for some part in his drama, and hands you the role. It may turn out that you are cast for a triumphant king; it may be for a slave who dies of torture. What does that matter to the good actor? He can play either part; his only business is to accept the role given him, and to perform it well. Similarly, life is a game of counters. Your business is to play it in the right way. He who set the board may have given you many counters; he may have given you few. He may have arranged that, at a particular point in the game, most of your men shall be swept accidentally off the board. You will lose the game; but why should you mind that? It is your play that matters, not the score that you happen to make. He is not a fool to judge you by your mere success or failure. Success or failure is a thing He can determine without stirring a hand. It hardly interests Him. What interests Him is the one thing which he cannot determine—the action of your free and conscious will.

This view is so sublime and so stirring that

at times it almost deadens one's power of criticism. Let us see how it works in a particular case. Suppose your friend is in sorrow or pain, what are you to do? In the first place, you may sympathize—since sympathy runs all through the universe, and if the stars sympathize surely you yourself may. And of course you must help. That is part of your function. Yet, all the time, while you are helping and sympathizing, are you not bound to remember that your friend's pain or sorrow does not really matter at all? He is quite mistaken in imagining that it does. Similarly, if a village in your district is threatened by a band of robbers, you will rush off with soldiers to save it; you will make every effort, you will give your life if necessary. But suppose, after all, you arrive too late and find the inhabitants with their throats cut and the village in ruins—why should you mind? You know it does not matter a straw whether the villagers' throats are cut or not cut; all that matters is how they behave in the hour of death. Mr. Bevan, whose studies of the Stoics and Sceptics form a rare compound of delicate learning and historical imagination, says that the attitude of the Stoic in a case like this is like that of

a messenger boy sent to deliver a parcel to some one, with instructions to try various addresses in order to find him. The good messenger boy will go duly to all the addresses, but if the addressee is not to be found at any of them, what does that matter to the messenger boy? He has done his duty, and the parcel itself has no interest for him. He may return and say he is sorry that the man cannot be found; but his sorrow is not heartfelt. It is only a polite pretense.

The comparison is a little hard on the Stoics. No doubt they are embarrassed at this point between the claims of high logic and of human feeling. But they meet the embarrassment bravely. "You will suffer in your friend's suffering," says Epictetus. "Of course you will suffer. I do not say that you must not even groan aloud. Yet in the center of your being do not groan!" It is very like the Christian doctrine of resignation. Man cannot but suffer for his fellow man; yet a Christian is told to accept the will of God and believe that ultimately, in some way which he does not see, the Judge of the World has done right.

Finally, what is to be the end after this life of Stoic virtue? Many religions, after

basing their whole theory of conduct on stern duty and self-sacrifice and contempt for pleasure, lapse into confessing the unreality of their professions by promising the faithful as a reward that they shall be uncommonly happy in the next world. It was not that they really disdained pleasure; it was only that they speculated for a higher rate of interest at a later date. Notably, Islam is open to that criticism, and so is a great deal of popular Christianity. Stoicism is not. It maintains its ideal unchanged.

You remember that we touched, in passing, the problem of decay. Nature shapes things towards their perfection, but she also lets them fall away after reaching a certain altitude. She fails constantly, though she reaches higher and higher success. In the end, said the Stoic—and he said it not very confidently, as a suggestion rather than a dogma—in the very end, perfection should be reached and then there will be no falling back. All the world will have been wrought up to the level of the divine soul. That soul is Fire; and into that Fire we shall all be drawn, our separate existence and the dross of our earthly nature burnt utterly away. Then there will be no more decay or

growth; no pleasure, no disturbance. It may be a moment of agony, but what does agony matter? It will be ecstasy and triumph, the soul reaching its fiery union with God.

The doctrine, fine as it is, seems always to have been regarded as partly fanciful, and not accepted as an integral part of the Stoic creed. Indeed, many Stoics considered that if this Absorption in Fire should occur, it could not be final. For the essence of Goodness is to do something, to labor, to achieve some end; and if Goodness is to exist the world process must begin again. God, so to speak, cannot be good unless he is striving and helping. Phusis must be moving upward, or else it is not Phusis.

Thus Stoicism, whatever its weaknesses, fulfilled the two main demands that man makes upon his religion: it gave him armour when the world was predominantly evil, and it encouraged him forward when the world was predominantly good. It afforded guidance both for the saint and the public servant. And in developing this twofold character I think it was not influenced by mere inconstancy. It was trying to meet the actual truth of the situation. For in most systems it seems to be recognized that in the Good Life there is

both an element of outward striving and an element of inward peace. There are things which we must try to attain, yet it is not really the attainment that matters; it is the seeking. And, consequently, in some sense, the real victory is with him who fought best, not with the man who happened to win. For beyond all the accidents of war, beyond the noise of armies and groans of the dying, there is the presence of some eternal friend. It is our relation to Him that matters.

A Friend behind phenomena, I owe the phrase to Mr. Bevan. It is the assumption which all religions make, and sooner or later all philosophies. The main criticism which I should be inclined to pass on Stoicism would lie here. Starting out with every intention of facing the problem of the world by hard thought and observation, resolutely excluding all appeal to tradition and mere mythology, it ends by making this tremendous assumption, that there is a beneficent purpose in the world and that the force which moves nature is akin to ourselves. If we once grant that postulate, the details of the system fall easily into place. There may be some overstatement about the worthlessness of pleasure and worldly goods; though, after all, if there is a single great

purpose in the universe, and that purpose good, I think we must admit that, in comparison with it, the happiness of any individual at this moment dwindles into utter insignificance. The good, and not any pleasure or happiness, is what matters. If there is no such purpose, well, then the problem must all be stated afresh from the beginning.

A second criticism, which is passed by modern psychologists on the Stoic system, is more searching but not so dangerous. The language of Stoicism, as of all ancient philosophy, was based on a rather crude psychology. It was over-intellectualized. It paid too much attention to the enormously larger part of human conduct which is below the level of consciousness. It saw life too much as a series of separate mental acts, and not sufficiently as a continuous, ever-changing stream. Yet a very little correction of statement is all that it needs. Stoicism does not really make reason into a motive force. It explains that an "impulse," of physical or biological origin rises in the mind prompting to some action, and then Reason gives or withholds its assent. There is nothing seriously wrong here.

Other criticisms, based on the unreality of

the ideal Wise Man, who acts without desire and makes no errors, seem to me of smaller importance. They depend chiefly on certain idioms or habits of language, which, though not really exact, convey a fairly correct meaning to those accustomed to them.

But the assumption of the Eternal Purpose stands in a different category. However much refined away, it remains a vast assumption. We may discard what Professor William James used to call "Monarchical Deism" or our own claim to personal immortality. We may base ourselves on Evolution, whether of the Darwinian or the Bergsonian sort. But we do seem to find, not only in all religions, but in practically all philosophies, some belief that man is not quite alone in the universe, but is met in his endeavors towards the good by some external help or sympathy. We find it everywhere in the unsophisticated man. We find it in the unguarded self-revelations of the most severe and conscientious Atheists. Now, the Stoics, like many other schools of thought, drew an argument from this consensus of all mankind. It was not an absolute proof of the existence of the Gods or Providence, but it was a strong indication. The existence of a com-

mon instinctive belief in the mind of man gives at least a presumption that there must be a good cause for that belief.

This is a reasonable position. There must be some such cause. But it does not follow that the only valid cause is the truth of the content of the belief. I cannot help suspecting that this is precisely one of those points on which Stoicism, in company with almost all philosophy up to the present time, has gone astray through not sufficiently realizing its dependence on the human mind as a natural biological product. For it is very important in this matter to realize that the so-called belief is not really an intellectual judgment so much as a craving of the whole nature.

It is only of very late years that psychologists have begun to realize the enormous dominion of those forces in man of which he is normally unconscious. We cannot escape as easily as these brave men dreamed from the grip of the blind powers beneath the threshold. Indeed, as I see philosophy after philosophy falling into this unproven belief in the Friend behind phenomena, as I find that I myself cannot, except for a moment and by an effort, refrain from making the

same assumption, it seems to me that perhaps here too we are under the spell of a very old ineradicable instinct. We are gregarious animals; our ancestors have been such for countless ages. We cannot help looking out on the world as gregarious animals do; we see it in terms of humanity and of fellowship. Students of animals under domestication have shown us how the habits of a gregarious creature, taken away from his kind, are shaped in a thousand details by reference to the lost pack which is no longer there—the pack which a dog tries to smell his way back to all the time he is out walking, the pack he calls to for help when danger threatens. It is a strange and touching thing, this eternal hunger of the gregarious animal for the herd of friends who are not there. And it may be, it may very possibly be, that, in the matter of this Friend behind phenomena, our own yearning and our own almost ineradicable instinctive conviction, since they are certainly not founded on either reason or observation, are in origin the groping of a lonely-souled gregarious animal to find its herd or its herd leader in the great spaces between the stars.

At any rate, it is a belief very difficult to get rid of.

NOTE.—Without attempting a bibliography of Stoicism, I may mention the following books as likely to be useful to a student: (1) Original Stoic Literature. Epictetus, Discourses, etc.; translated by P. E. Matheson, Oxford, 1915. Marcus Aurelius, To Himself; translated by J. Jackson, Oxford, 1906. Stoicorum Veterum Fragmenta, collected by Von Arnim, 1903-1905. (2) Modern Literature. Roman Stoicism (Cambridge, 1911), by E. V. Arnold; a very thorough and useful piece of work. Stoics and Sceptics, by Edwyn Bevan (Oxford, 1913); slighter, but illuminating. The doctrine of the things which are "preferred" though not "good," was, I think, first correctly explained by H. Gomperz, *Lebensauffassung der Griechischen Philosophie*, 1904. Professor Arnold's book contains a large bibliography.

Crime and Criminals

BY CLARENCE S. DARROW.

If I looked at jails and crimes and prisoners in the way the ordinary person does, I should not speak on this subject to you. The reason I talk to you on the question of crime, its cause and cure, is because I really do not in the least believe in crime. There is no such thing as a crime as the word is generally understood. I do not believe there is any sort of distinction between the real moral condition of the people in and out of jail. One is just as good as the other. The people here can no more help being here than the people outside can avoid being outside. I do not believe that people are in jail because they deserve to be. They are in jail simply because they cannot avoid it on account of circumstances which are entirely beyond their control and for which they are in no way responsible.

I suppose a great many people on the outside would say I was doing you harm if they should hear what I say to you this afternoon, but you cannot be hurt a great deal anyway, so it will not matter. Good people outside would say that I was really teaching you things that were calculated to injure society, but it's worth while now and then to hear something different from what you ordinarily get from preach-

ers and the like. These will tell you that you should be good and then you will get rich and be happy. Of course we know that people do not get rich by being good, and that is the reason why so many of you people try to get rich some other way, only you do not understand how to do it quite as well as the fellow outside.

There are people who think that everything in this world is an accident. But really there is no such thing as an accident. A great many folks admit that many of the people in jail ought to be there, and many who are outside ought to be in. I think none of them ought to be here. There ought to be no jails, and if it were not for the fact that the people on the outside are so grasping and heartless in their dealings with the people on the inside, there would be no such institutions as jails.

I do not want you to believe that I think all you people here are angels. I do not think that. You are people of all kinds, all of you doing the best you can, and that is evidently not very well—you are people of all kinds and conditions and under all circumstances. In one sense everybody is equally good and equally bad. We all do the best we can under the circumstances. But as to the exact things for which you are sent here, some of you are guilty and did the particular act because you needed the money. Some of you did it because you are in the habit of doing it, and some of

you because you are born to it, and it comes to be as natural as it does, for instance, for me to be good.

Most of you probably have nothing against me, and most of you would treat me the same as any other person would; probably better than some of the people on the outside would treat me, because you think I believe in you and they know I do not believe in them. While you would not have the least thing against me in the world you might pick my pockets. I do not think all of you would, but I think some of you would. You would not have anything against me, but that's your profession, a few of you. Some of the rest of you, if my doors were unlocked, might come in if you saw anything you wanted—not out of any malice to me, but because that is your trade. There is no doubt there are quite a number of people in this jail who would pick my pockets. And still I know this, that when I get outside pretty nearly everybody picks my pocket. There may be some of you who would hold up a man on the street, if you did not happen to have something else to do, and needed the money; but when I want to light my house or my office the gas company holds me up. They charge me one dollar for something that is worth 25 cents, and still all these people are good people; they are pillars of society and support the churches, and they are respectable.

When I ride on the street cars, I am held

up—I pay seven cents for a ride that is worth two and a half cents, simply because a body of men have bribed the city council and the legislature, so that all the rest of us have to pay tribute to them.

If I do not want to fall into the clutches of the gas trust and choose to burn oil instead of gas, then good Mr. Rockefeller holds me up, and he uses a certain portion of his money to build universities and support churches which are engaged in telling us how to be good.

Some of you are here for obtaining property under false pretenses—yet I pick up a great Sunday paper and read the advertisements of a merchant prince—"Shirt waist for 39 cents, marked down from \$3."

When I read the advertisements in the paper I see they are all lies. When I want to get out and find a place to stand anywhere on the face of the earth, I find that it has all been taken up long ago before I came here, and before you came here, and somebody says, "Get off, swim into the lake, fly into the air; go anywhere, but get off." That is because these people have the police and they have the jails and the judges and the lawyers and the soldiers and all the rest of them to take care of the earth and drive everybody off that comes in their way.

A great many people will tell you that all this is true, but that it does not excuse you. These facts do not excuse some fellow who

reaches into my pocket and takes out a five-dollar bill; the fact that the gas company bribes the members of the legislature from year to year, and fixes the law, so that all you people are compelled to be "fleeced" whenever you deal with them; the fact that the street car companies and the gas companies have control of the streets and the fact that the landlords own all the earth, they say, has nothing to do with you.

Let us see whether there is any connection between the crimes of the respectable classes and your presence in the jail. Many of you people are in jail because you have really committed burglary. Many of you, because you have stolen something; in the meaning of the law, you have taken some other person's property. Some of you have entered a store and carried off a pair of shoes because you did not have the price. Possibly some of you have committed murder. I cannot tell what all of you did. There are a great many people here who have done some of these things who really do not know themselves why they did them. I think I know why you did them—every one of you; you did these things because you were bound to do them. It looked to you at the time as if you had a chance to do them or not, as you saw fit, but still after all you had no choice. There may be people here who had some money in their pockets and who still went out and got some more money in a way society forbids.

Now you may not yourselves see exactly why it was you did this thing, but if you look at the question deeply enough and carefully enough you would see that there were circumstances that drove you to do exactly the thing which you did. You could not help it any more than we outside can help taking the positions that we take. The reformers who tell you to be good and you will be happy, and the people on the outside who have property to protect—they think that the only way to do it is by building jails and locking you up in cells on week-days and praying for you Sundays.

I think that all of this has nothing whatever to do with right conduct. I think it is very easily seen what has to do with right conduct. Some so-called criminals—and I will use this word because it is handy, it means nothing to me—I speak of the criminals who get caught as distinguished from the criminals who catch them—some of these so-called criminals are in jail for the first offenses, but nine-tenths of you are in jail because you did not have a good lawyer and of course you did not have a good lawyer because you did not have enough money to pay a good lawyer. There is no very great danger of a rich man going to jail.

Some of you may be here for the first time. If we would open the doors and let you out, and leave the laws as they are today, some of

you would be back tomorrow. This is about as good a place as you can get anyway. There are many people here who are so in the habit of coming that they would not know where else to go. There are people who are born with the tendency to break into jail every chance they get, and they cannot avoid it. You cannot figure out your life and see why it was, but still there is a reason for it, and if we were all wise and knew all the facts we could figure it out.

In the first place, there are a good many more people who go to jail in the winter time than in summer. Why is this? Is it because people are more wicked in winter? No, it is because the coal trust begins to get in its grip in the winter. A few gentlemen take possession of the coal, and unless the people will pay \$10 or \$12 a ton for something that is worth \$3, they will have to freeze. Then there is nothing to do but to break into jail, and so there are many more in jail in the winter than in summer. It costs more for gas in the winter because the nights are longer, and people go to jail to save gas bills. The jails are electric lighted. You may not know it, but these economic laws are working all the time, whether we know it or do not know it.

There are more people go to jail in hard times than in good times—few people comparatively go to jail except when they are hard up. They go to jail because they have no

other place to go. They may not know why, but it is true all the same. People are not more wicked in hard times. That is not the reason. The fact is true all over the world that in hard times more people go to jail than in good times, and in winter more people go to jail than in summer. Of course it is pretty hard times for people who go to jail at any time. The people who go to jail are almost always poor people—people who have no other place to live first and last. When times are hard then you find large numbers of people who go to jail who would not otherwise be in jail.

Long ago, Mr. Buckle, who was a great philosopher and historian, collected facts and he showed that the number of people who are arrested increased just as the price of food increased. When they put up the price of gas ten cents a thousand I do not know who will go to jail, but I do know that a certain number of people will go. When the meat combine raises the price of beef I do not know who is going to jail, but I know that a large number of people are bound to go. Whenever the Standard Oil Company raises the price of oil, I know that a certain number of girls who are seamstresses, and who work after night long hours for somebody else, will be compelled to go out on the streets and ply another trade, and I know that Mr. Rockefeller and his associates are responsible and not the poor girls

in the jail.

First and last, people are sent to jail because they are poor. Sometimes, as I say, you may not need money at the particular time, but you wish to have thrifty forehanded habits, and do not always wait until you are in absolute want. Some of you people are perhaps plying the trade, the profession, which is called burglary. No man in his right senses will go into a strange house in the dead of night and prowl around with a dark lantern through unfamiliar rooms and take chances of his life if he has plenty of the good things of the world in his own home. You would not take any such chances as that. If a man had clothes in his clothes-press and beefsteak in his pantry, and money in the bank, he would not navigate around nights in houses where he knows nothing about the premises whatever. It always requires experience and education for this profession, and people who fit themselves for it are no more to blame than I am for being a lawyer. A man would not hold up another man on the street if he had plenty of money in his own pocket. He might do it if he had one dollar or two dollars, but he wouldn't if he had as much money as Mr. Rockefeller has. Mr. Rockefeller has a great deal better hold-up game than that.

The more that is taken from the poor by the rich, who have the chance to take it, the more poor people there are who are compelled to

resort to these means for a livelihood. They may not understand it, they may not think so at once, but after all they are driven into that line of employment.

There is a bill before the legislature of this State to punish kidnapping children, with death. We have wise members of the Legislature. They know the gas trust when they see it and they always see it—they can furnish light enough to be seen, and this Legislature thinks it is going to stop kidnapping children by making a law punishing kidnappers of children with death. I don't believe in kidnapping children, but the Legislature is all wrong. Kidnapping children is not a crime, it is a profession. It has been developed with the times. It has been developed with our modern industrial conditions. There are many ways of making money—many new ways that our ancestors knew nothing about. Our ancestors knew nothing about a billion-dollar trust; and here comes some poor fellow who has no other trade and he discovers the profession of kidnapping children.

This crime is born, not because people are bad; people don't kidnap other people's children because they want the children or because they are devilish, but because they see a chance to get some money out of it. You cannot cure this crime by passing a law punishing by death kidnappers of children. There is one way to cure it. There is one way to

cure all these offenses, and that is to give the people a chance to live. There is no other way, and there never was any other way since the world began, and the world is so blind and stupid that it will not see. If every man and woman and child in the world had a chance to make a decent, fair, honest living, there would be no jails, and no lawyers and no courts. There might be some persons here or there with some peculiar formation of their brain, like Rockefeller, who would do these things simply to be doing them; but they would be very, very few, and those should be sent to a hospital and treated, and not sent to jail; and they would entirely disappear in the second generation, or at least in the third generation.

I am not talking pure theory. I will just give you two or three illustrations.

The English people once punished criminals by sending them away. They would load them on a ship and export them to Australia. England was owned by lords and nobles and rich people. They owned the whole earth over there, and the other people had to stay in the streets. They could not get a decent living. They used to take their criminals and send them to Australia—I mean the class of criminals who got caught. When these criminals got over there, and nobody else had come, they had the whole continent to run over, and so they could raise sheep and furnish their

own meat, which is easier than stealing it; these criminals then became decent, respectable people because they had a chance to live. They did not commit any crimes. They were just like the English people who sent them there, only better. And in the second generation the descendants of those criminals were as good and respectable a class of people as there were on the face of the earth, and then they began building churches and jails themselves.

A portion of this country was settled in the same way, landing prisoners down on the southern coast; but when they got here and had a whole continent to run over and plenty of chances to make a living, they became respectable citizens, making their own living just like any other citizens in the world; but finally these descendants of the English aristocracy, who sent the people over to Australia, found out they were getting rich, and so they went over to get possession of the earth as they always do, and they organized land syndicates and got control of the land and ores, and then they had just as many criminals in Australia as they did in England. It was not because the world had grown bad; it was because the earth had been taken away from the people.

Some of you people have lived in the country. It's prettier than it is here. And if you have ever lived on a farm you understand

that if you put a lot of cattle in a field, when the pasture is short they will jump over the fence; but put them in a good field where there is plenty of pasture, and they will be law-abiding cattle to the end of time. The human animal is just like the rest of the animals, only a little more so. The same thing that governs in the one governs in the other.

Everybody makes his living along the lines of least resistance. A wise man who comes into a country early sees a great undeveloped land. For instance, our rich men twenty-five years ago saw that Chicago was small and knew a lot of people would come here and settle, and they readily saw that if they had all the land around here it would be worth a good deal, so they grabbed the land. You cannot be a landlord because somebody has got it all. You must find some other calling. In England and Ireland and Scotland less than 5 per cent own all the land there is, and the people are bound to stay there on any kind of terms the landlords give. They must live the best they can, so they develop all these various professions—burglary, picking pockets and the like.

Again, people find all sorts of ways of getting rich. These are diseases like everything else. You look at people getting rich, organizing trusts, and making a million dollars, and somebody gets the disease and he starts out. He catches it just as a man catches the mumps.

or measles; he is not to blame, it is in the air. You will find men speculating beyond their means, because the mania of money-getting is taking possession of them. It is simply a disease; nothing more, nothing less. You cannot avoid catching it; but the fellows who have control of the earth have the advantage of you. See what the law is; when these men get control of things, they make the laws. They do not make the laws to protect anybody; courts are not instruments of justice; when your case gets into court it will make little difference whether you are guilty or innocent; but it's better if you have a smart lawyer. And you cannot have a smart lawyer unless you have money. First and last it's a question of money. Those men who own the earth make the laws to protect what they have. They fix up a sort of fence or pen around what they have, and they fix the law so the fellow on the outside cannot get in. The laws are really organized for the protection of the men who rule the world. They were never organized or enforced to do justice. We have no system for doing justice, not the slightest in the world.

Let me illustrate: Take the poorest person in this room. If the community had provided a system of doing justice the poorest person in this room would have as good a lawyer as the richest, would he not? When you went into court you would have just as long a trial, and just as fair a trial as the richest person

in Chicago. Your case would not be tried in fifteen or twenty minutes, whereas it would take fifteen days to get through with a rich man's case.

Then if you were rich and were beaten, your case would be taken to the Appellate Court. A poor man cannot take his case to the Appellate Court; he has not the price; and then to the Supreme Court, and if he were beaten there he might perhaps go to the United States Supreme Court. And he might die of old age before he got into jail. If you are poor, it's a quick job. You are almost known to be guilty, else you would not be there. Why should any one be in the criminal court if he were not guilty? He would not be there if he could be anywhere else. The officials have no time to look after all these cases. The people who are on the outside, who are running banks and building churches and making jails, they have no time to examine 600 or 700 prisoners each year to see whether they are guilty or innocent. If the courts were organized to promote justice the people would elect somebody to defend all these criminals, somebody as smart as the prosecutor—and give him as many detectives and as many assistants to help, and pay as much money to defend you as to prosecute you. We have a very able man for State's Attorney, and he has many assistants, detectives and policemen without end, and judges to hear

the cases—everything handy.

Most of all our criminal code consists in offenses against property. People are sent to jail because they have committed a crime against property. It is of very little consequence whether one hundred people more or less go to jail who ought not to go—you must protect property, because in this world property is of more importance than anything else.

How is it done? These people who have property fix it so they can protect what they have. When somebody commits a crime it does not follow that he has done something that is morally wrong. The man on the outside who has committed no crime may have done something. For instance: to take all the coal in the United States and raise the price two dollars or three dollars when there is no need of it, and thus kill thousands of babies and send thousands of people to the poorhouse and tens of thousands to jail, as is done every year in the United States—this is a greater crime than all the people in our jails ever committed, but the law does not punish it. Why? Because the fellows who control the earth make the laws. If you and I had the making of the laws, the first thing we would do would be to punish the fellow who gets control of the earth. Nature put this coal in the ground for me as well as for them and nature made the prairies up here to raise wheat for me as well as for them, and then the great

railroad companies came along and fenced it up.

Most all of the crimes for which we are punished are property crimes. There are a few personal crimes, like murder—but they are very few. The crimes committed are mostly those against property. If this punishment is right the criminals must have a lot of property. How much money is there in this crowd? And yet you are all here for crimes against property. The people up and down the Lake Shore have not committed crime, still they have so much property they don't know what to do with it. It is perfectly plain why these people have not committed crimes against property; they make the laws and therefore do not need to break them. And in order for you to get some property you are obliged to break the rules of the game. I don't know but what some of you may have had a very nice chance to get rich by carrying the hod for one dollar a day, twelve hours. Instead of taking that nice, easy profession, you are a burglar. If you had been given a chance to be a banker you would rather follow that. Some of you may have had a chance to work as a switchman on a railroad where you know, according to statistics, that you cannot live and keep all your limbs more than seven years, and you can get fifty dollars or seventy-five dollars a month for taking your lives in your hands, and instead of taking that lucrative

position you choose to be a sneak thief, or something like that. Some of you made that sort of choice. I don't know which I would take if I was reduced to this choice. I have an easier choice.

I will guarantee to take from this jail, or any jail in the world, five hundred men who have been the worst criminals and law-breakers who ever got into jail, and I will go down to our lowest streets and take five hundred of the most abandoned prostitutes, and go out somewhere where there is plenty of land, and will give them a chance to make a living, and they will be as good people as the average in the community.

There is a remedy for the sort of condition we see here. The world never finds it out, or when it does find it out it does not enforce it. You may pass a law punishing every person with death for burglary, and it will make no difference. Men will commit it just the same. In England there was a time when one hundred different offenses were punishable with death, and it made no difference. The English people strangely found out that so fast as they repealed the severe penalties and so fast as they did away with punishing men by death, crime decreased instead of increased; that the smaller the penalty the fewer the crimes.

Hanging men in our county jails does not prevent murder. It makes murderers.

And this has been the history of the world. It's easy to see how to do away with what we call crime. It is not so easy to do it. I will tell you how to do it. It can be done by giving the people a chance to live—by destroying special privileges. So long as big criminals can get the coal fields, so long as the big criminals have control of the city council and get the public streets for streets cars and gas rights, this is bound to send thousands of poor people to jail. So long as men are allowed to monopolize all the earth, and compel others to live on such terms as these men see fit to make, then you are bound to get into jail.

The only way in the world to abolish crime and criminals is to abolish the big ones and the little ones together. Make fair conditions of life. Give men a chance to live. Abolish the right of private ownership of land, abolish monopoly, make the world partners in production, partners in the good things of life. Nobody would steal if he could get something of his own some easier way. Nobody will commit burglary when he has a house full. No girl will go out on the streets when she has a comfortable place at home. The man who owns a sweatshop or a department store may not be to blame himself for the condition of his girls, but when he pays them five dollars, three dollars, and two dollars a week, I wonder where he thinks they will get the rest of their money to live. The only way to cure

these conditions is by equality. There should be no jails. They do not accomplish what they pretend to accomplish. If you would wipe them out, there would be no more criminals than now. They terrorize nobody. They are a blot upon any civilization, and a jail is an evidence of the lack of charity of the people on the outside who make the jails and fill them with the victims of their greed.

THE IGNORANT PHILOSOPHER

I. THE FIRST DOUBT.

Who art thou? From whence dost thou come? What is thy employment? What will become of thee? These are questions that should be put to every being in the universe, but to which no one replies. I ask of plants by what virtue they grow, and how the same earth produces such a diversity of fruits? These insensible and mute beings, though enriched with a divine faculty, leave me to my own ignorance and to vain conjectures.

I interrogate that herd of different animals, all which have the power of motion and communication, who enjoy the same sensations as myself, whose passions are accompanied with an extent of ideas and memory. They are still more ignorant than myself what they are, wherefore they exist, and what they shall become.

I suspect, I have even some reason to believe that the planets, the innumerable suns which replenish space, are peopled with sensible and thinking people; but an eternal barrier separates us, and no inhabitant of the other globes ever communed with us.

The Prior, in *Nature Displayed*, says to the Knight, that the stars were made for the earth, and the earth as well as animals for man. But as the little globe of earth revolves with the other planets round the sun; as the

regular and proportionate motions of the stars may eternally subsist without men; as there are in our little planet an infinitely greater number of animals than human beings; I imagine that the Prior was actuated by too great a share of self-love, in flattering himself that every thing had been made for him. I find that man in his life-time will be devoured by every kind of animal, if he be defenceless, and that they all devour him after his death. Wherefore I have had some difficulty in conceiving that the Prior and the Knight were the sovereigns of nature. A slave to every thing that surrounds me, instead of being a king; chained to a single point, and environed with immensity; I will begin by searching into myself.

II. OUR WEAKNESS

I am a weak animal; at my birth I have neither strength, knowledge, nor instinct; I cannot even crawl to my mother's breast, like every quadruped; I only acquire a few ideas, as I acquire a little strength, and as my organs begin to unfold themselves. This strength increases in me, till such time as having attained my full growth it daily decreases. This power of conceiving ideas increases in the same manner during its term, and afterwards by degrees insensibly vanishes.

What is that mechanism which momentarily increases the strength of my members, as far as the prescribed boundaries? I am ignorant

of it; and those who have passed their whole lives in the research, know no more than myself.

What is that other power, which conveys images into my brain, and which preserves them in my memory? Those who are paid for knowing have only made fruitless enquiries; we are all in the same state of ignorance, with regard to the first principles of our infant state.

III. HOW AM I TO THINK.

Have the books which have been written for these two thousand years taught me anything? We have sometimes a desire of knowing in what manner we think, though we have seldom any desire of knowing how we digest, how we walk. I have questioned my reason, and asked what it is? This question has always confounded me.

I have endeavored to discover by it, if the same springs that make me digest, which make me walk, are the same whereby I receive ideas. I never could conceive how and wherefore these ideas fled when my body languished with hunger, and how they were renovated after I had eaten.

I discovered such a wide difference between thought and nourishment, without which I should not think, that I believed there was a substance in me that reasoned, and another substance that digested. Nevertheless, by constantly endeavoring to convince myself

that we are two, I materially felt that I was only one; and this contradiction gave me infinite pain.

I have asked some of my own likenesses who cultivate the earth, our common mother, with great industry, if they felt that they were two? if they had discovered by their philosophy, that they possessed within them an immortal substance, and nevertheless formed of nothing, existing without extent, acting upon their nerves, without touching them, sent expressly into them six weeks after their conception? They thought that I was jesting, and pursued the cultivation of their land without making me a reply.

IV. IS IT NECESSARY FOR ME TO KNOW?

Finding then that a prodigious number of men had not even the slightest idea of the difficulties that disturbed me, and had no doubts of what is taught in schools, of being in general, matter and spirit, etc., finding that they often ridiculed my desire of being acquainted with these things; I suspected that it was not in the least necessary that we should know them: I imagined that nature has given to every being a portion that is proper for him; and I thought those things which we could not attain, did not belong to us. But notwithstanding this despair, I cannot divest myself of a desire of being instructed; and my baffled curiosity is ever insatiable.

V. ARISTOTLE, DESCARTES AND GASSENDI.

Aristotle begins by saying, that incredulity is the source of wisdom; Descartes has carried this sentiment still farther, and they have both taught me to believe nothing they say. This Descartes, particularly, after pretending to doubt, speaks in such an affirmative manner of what he does not understand; he is sure of the fact, when he is grossly mistaken in physics; he has built such an imaginary world; his whirlwinds and three elements are so prodigiously ridiculous, that I ought to suspect everything he says upon the soul, after he has imposed upon me with respect to bodies.

He believes, or affects to believe, that we are born with metaphysical ideas. I would as soon aver that Homer was born with the Iliad in his head. It is very true, that Homer, at his birth, had a brain so constructed, that having afterwards acquired poetical ideas, sometimes fine, sometimes incoherent, or sometimes exaggerated, he at length composed the Iliad. We bring into the world at our birth the seed of what afterwards displays itself in us; but we have really no more innate ideas than Raphael and Michael Angelo had at their birth pencils and colors.

Descartes endeavors to unite his scattered chimeras, by supposing men always to think; I would as soon imagine that birds never cease flying, or dogs running, because they are endowed with these abilities.

We need only consult a little of our experience and that of human nature, to be thoroughly convinced of the contrary; there is no man mad enough to firmly believe he has thought all his life, night and day, without interruption, from the time of his being a foetus till his last illness. The only resource of those who have defended such a romance has been to say that we always think, but we do not always perceive that we think. It might be as well asserted, that we drink, eat, and ride on horseback without knowing it. If you don't perceive that you possess any ideas, how can you affirm that you have any? Gassendi ridiculed this extravagant system as it deserved. Do you know what was the consequence? Gassendi and Descartes were pronounced atheists.

VI. BEASTS.

Man being supposed to have continually possessed ideas, perceptions, and conceptions, it naturally follows, that beasts were likewise always in possession of them; for it is incontestable that a hunting dog has the idea of the master he obeys, and of the game that he brings him. It is evident that he has memory, and that he combines some ideas. Thus then if the thought of man be the essence of his soul, that of the dog is the essence of his soul, and if man had always ideas, animals must necessarily have had them also. To remove this difficulty, the manufacturer or

whirlwinds and chamfered matter dared to say, that beasts were pure machines, who sought for food without appetite, who had constantly had the organs of sensation without ever having the least sensation, who cried without pain, who testified joy without pleasure, who possessed a brain incapable of receiving the slightest idea, and who were therefore a perpetual contradiction.

This system was as ridiculous as the other; but instead of exposing extravagance, it was treated as impious. It was pretended that this system was repugnant to the Holy Scriptures, which says in Genesis, "And surely your blood of your lives will I require; at the hand of every beast will I require it;" which manifestly supposes in beasts a knowledge of, and acquaintance with, good and evil

VII. EXPERIENCE.

Let us never introduce the Holy Scriptures into our philosophical disputes; these are things too heterogeneous, and which have no relation to it. The point here is to examine what we can know by ourselves, and this is reduced to a very narrow compass. We must give up all pretensions to common sense not to agree, that we know nothing in the world but by experience, and by a succession of groping and long reflection, that we obtain some feeble and slight ideas of body, of space, time, infinity, and God himself; it would not be worth while for the author of nature to put

these ideas into the brain of every foetus, in order that only a very small number of men should make use of them

We are all, with respect to the objects of our knowledge, like the ignorant lovers Daphnis and Chloe, whose amours and innocence Longus has depicted. They required much time to learn how to satisfy their desires, they having no experience. The same thing happened to the emperor Leopold, and to a son of Louis XIV.; it was necessary to instruct them. If they had been born with innate ideas, we should believe that nature would not have refused them the knowledge necessary for the preservation of the human species.

VIII. SUBSTANCE.

As we can have no notion, but by experience, it is not impossible that we can ever know what matter is. We touch, we see the properties of this substance; but this very expression "substance which is beneath," sufficiently acquaints us that this thing beneath will ever be unknown to us; whatever we may discover of its appearance, there will always remain this beneath to discover. For the same reason, we can never know by ourselves what is spirit. It is a word which usually signifies breath, and by which we endeavor to express vaguely and grossly that which gives us thoughts. But when, even by a prodigy, which is not to be supposed, we should acquire some slight idea of the substance of this spirit, we

should be no farther advanced; and we could never guess how this substance received sentiments and thoughts. We know very well that we have some small intellectual faculty; but how do we obtain it? This is a secret of nature, which she has not divulged to any mortal.

IX. NARROW LIMITS.

Our intellects are confined as well as the strength of our body. Some men are more robust than others; there are also Hercules' with respect to thought; but, at the bottom, this superiority is a very trivial thing. One shall lift ten times as much matter as myself; another can do in his head and without paper, a division of fifteen figures, whilst I can only divide three or four, with much difficulty; here then is the extent of that vaunted strength; its limits are very confined; and therefore in games of combination, no man after having trained himself with great application and long practice, will, with all his efforts, get beyond that degree of perfection allotted him: this is the goal of his intellect. It is absolutely necessary that it should be so, otherwise we should gradually go on to infinity.

X. IMPOSSIBLE DISCOVERIES.

In this narrow circle by which we are circumscribed, let us see what we are condemned

to be ignorant of, and what we gain a little knowledge of. We have already found, that no first resource, no first principle, can be traced by us.

Why does my arm obey my will? We are so accustomed to this incomprehensible phenomenon, that very few pay attention to it; and when we want to trace the cause of so common an effect, we find that there is infinity between our will and the obedience of our limb; that is to say, there is no proportion between them, no reason, no apparent cause; and we feel that we might think of eternity, without being able to discover the least glimpse of probability.

XI. THE FOUNDATION OF DESPAIR.

Thus stopped at the very first onset, and vainly relying upon ourselves, we are dismayed from seeking after ourselves, as we can never discover ourselves. To ourselves we are inexplicable.

We know pretty nearly, with the assistance of triangles, that the sun and earth are about thirty millions of geometrical miles distant; but what is the sun? and wherefore does it turn upon its axis? and why in one sense more than another? and why do Saturn and we revolve round this planet sooner from west to east than from east to west? This question will not only ever remain unsatisfied, but

we shall never discover the least possibility to devise a physical cause of it. Wherefore? because the first knot of this difficulty is in the principle of things.

It is the same with respect to what acts within us, as to what actuates the immense spaces of nature. There is in the arrangement of the planets, and in the formation of a hand-worm, and of man, a first principle, the avenue to which must necessarily be barred against us. For if we could be acquainted with the cause of our first origin, we should be its masters, we should be gods. Let us illustrate this idea, and see if it be just.

Suppose that we found, in effect, the cause of our sensations, of our thoughts, and our motions, as we have only discovered in the planets the reason of eclipses and of the different phases of the moon and Venus; it is evident we could then foretell our sensations, our thoughts, and our desires resulting from these sensations, as we predict the phases and the eclipses. Being then acquainted with what would happen to-morrow within us, we should clearly see by the play of this machine, whether we should be affected in a fatal or auspicious manner. We have, it is agreed, a will that directs our interior motions in various circumstances. For example, I find myself disposed to wrath, my reflection and will suppress its growing exhibition; I shall see if I know my first principles, all the affections to which I am disposed for tomorrow, all the successive ideas that wait for me; I could have the same

power over this succession of ideas and sentiments, as I sometimes exert over actual sentiments and thoughts, which I divert and repress. I should find myself precisely in the same case with every man who can retard and accelerate, according to his will, the motion of a watch, a ship, or any other well-known machine.

Being master of the ideas that are destined for me tomorrow, I should be also of those for the following day, and even the remainder of my life; I could then be ever powerful over myself. I should be the God of myself. I am very sensible that this state is incompatible with my nature; it is therefore impossible that I can know anything of the first principle which makes me think and act.

XII. DOUBT.

Is that which is impossible for my weak limited nature of so short a duration, equally impossible in other globes, in other species of beings? Are there any superior intelligences, masters of all their ideas, who think and feel all that they choose? I know nothing of the matter; I am only acquainted with my own weakness, I have no idea of the powers of others.

XIII. AM I FREE.

Let us not yet quit the circle of our existence; let us examine ourselves as far as we

are able. I remember one day before I had put all the foregoing questions, a reasoner wanted to make me reason. He asked me if I was free? I replied that I was not in prison, that I had the key of my chamber, that I was perfectly free. That is not what I ask you, he replied, do you believe your will is at liberty of disposing or not disposing you to throw yourself out of the window? Do you think with the scholastic angel that the free agent is an appetitive power, and the free agent is lost by sin? I fixed my eyes upon the querist, in order to read in his, if he was not out of his mind; and I answered, that I did not understand the least of his gibberish.

Nevertheless, this question, upon the freedom of man, greatly interested me; I read scholastics, and, like them, I was in the dark; I read Locke, and I discovered some rays of light; I read Collin's treatise, which appeared to me an improvement upon Locke; and I have never read anything since that has given me additional instruction. This is what my weak reason hath conceived, with the assistance of these two great men, the only two, who have, in my opinion, understood themselves in writing upon this subject, and the only two who have made themselves understood to others.

There is nothing without a cause. An effect without a cause, are words without meaning. Every time that I have a will, this can only be in consequence of my judgment, good or bad; this judgment is necessary, consequently, so is my will. In effect, it would be very

singular that all nature, all the planets, should obey eternal laws, and that there should be a little animal five feet high, who, in contempt of these laws, could act as he pleased, solely according to his caprice. He would act by chance; and we know that chance is nothing. We have invented this word to express the known effect of all unknown causes.

My ideas necessarily enter into my brain. how then can my will, which depends upon them, be free? I feel upon various occasions, that this will is not free; thus when I am overwhelmed with illness, when I am transported with passion, when my judgment cannot comprehend objects that present themselves to me, etc. I should think, therefore, that the laws of nature being always the same, my will is not more free in things that appear to me the most indifferent, than in those in which I find myself compelled by an invincible force.

To be really free is to have power. My liberty consists in doing what I choose: but I must necessarily choose what I will; otherwise it would be without reason, without cause, which is impossible. My liberty consists in walking when I have a mind to walk, and I have not the gout.

My liberty consists in not doing a bad action when my mind necessarily represents it as a bad action; to subdue a passion, when my mind points out to me the danger of it, and the horror of the act powerfully combats my desire. We may suppress our passions

(as I have already said, No. IV.) but then we are not freer in suppressing our desires, than by letting ourselves be carried away by our inclination; for in both cases, we irresistibly pursue our last idea; and this last is necessary: wherefore I necessarily perform what this dictates to me. It is strange that men should not be content with this measure of liberty, that is to say, the power which they have received from nature of doing what they choose; the planets have it not; we possess it, and our pride makes us sometimes believe that we possess still more. We figure to ourselves that we have the incomprehensible and absurd gift of election, without reason, without any other motive than that of free-will. See No. XXIX.

No, I cannot forgive Dr. Clarke for having sophistically opposed these truths, the force of which he felt, but which did not well agree with his systems. No, it is not allowed to such a philosopher as him to attack Collins as a sophist, by changing the state of the question, and reproaching Collins with calling man "a necessary agent." Agent or patient, what doth it signify? An agent when he voluntarily moves, a patient when he receives ideas. What doth the name to the thing? Man is in everything a dependent being, as nature is throughout dependent, and he cannot be excepted from other beings.

The preacher in Samuel Clarke stifles the philosopher; he distinguishes the physical from the moral necessity. And what is a

moral necessity? It appears probable to you that a queen of England, whose coronation ceremony is performed in a church, will not cast off her regal robes to throw herself quite naked upon the altar, though a similar adventure is related of a queen of Congo. You call this a moral necessity in a queen of our climate; but it is at the bottom, a physical and eternal necessity, blended with the constitution of things. It is as certain this queen will not be guilty of such a folly, as that she will one day die. Moral necessity is but a phase: all that is done is absolutely necessary. There is no medium between necessity and chance; and you know there is no chance: wherefore all that happens is necessary?

To embarrass the thing still more, it has been devised to distinguish again between necessity and constraint; but constraint, in fact, is nothing but necessity that is perceived, and necessity is a constraint, that is unperceived. Archimedes is equally necessitated to remain in his chamber when shut in, as when he is deeply engaged with a problem, and the idea of going out does not occur to him.

Ducunt volentem fata, nolentum trahunt.

The ignoramus who thinks in this manner, did not always think the same; but he is at length compelled to yield.

XVI. IS EVERY THING ETERNAL?

Subject to eternal laws like every sphere that replenishes space, as the elements, animals,

and plants, I view with astonishment every thing that surrounds me; I search for my author, and the author of that immense machine, of which I am scarce a perceptible wheel.

I am not derived from nothing; for the substance of my father and mother, who bore me nine months in her womb, is something. It is evident to me that the sperm which produced me, could not be produced from nothing; for how can nothing produce existence? I find myself subdued by this maxim of all antiquity, "nothing arises from naught, nothing can return to naught."

This axiom carries with it such dreadful power, that it bears down all my understanding, without my being able to contend with it. No philosopher has ever lost sight of it. No legislator whatsoever has contested it. The Cahut of the Phoenicians, the Chaos of the Greeks, the Tohu-bohu of the Chaldeans and the Hebrews, all evince that the eternity of matter has ever been believed. My reason, perhaps, deceived by so ancient and general an idea, tells me—matter must necessarily be eternal, because it exists: if it was in being yesterday, it was before.

I cannot perceive any probability of its having begun to be, any cause why it had not been, any cause wherefore it received existence at one time more than at another. I therefore yield to this conviction, whether well or ill founded, and I list myself under the banner of the whole world, till such time as

having some progress in my researches, I discover a luminary superior to the judgment of all mankind, which compels me to retract against my will.

But if, according to the opinion of so many philosophers of antiquity, the eternal being has always acted, what becomes of the Cahut and Erebus of the Phoenicians, the Tohu-bohu of the Chaldeans, the Chaos of Hesiod? they will remain fables. Chaos is an impossibility in the eyes of reason; for it is impossible that intelligence being eternal, there should ever have been anything contrary to the laws of that intelligence: now the Chaos is precisely contrary to all the laws of nature. Enter into the most horrid caverns of the Alps, under those ruins of rocks, ice, sand, waters, unfashioned crystals, and minerals, they all submit to gravitation. Chaos never existed anywhere but in our heads, and has only served to assist Hesiod and Ovid in the composing of some elegant verses.

If our Holy Scripture says Chaos did exist, if it had adopted the Tohu-bohu, we doubtless believe it, and with the most ready faith. We are, in this place, speaking only of the deceitful lights of our reason. We have confined ourselves, as we have said, to what we may suspect by ourselves. We are children, who endeavor to go a few steps without leading-strings.

XV. INTELLIGENCE

But in perceiving the order, prodigious skill, mechanical and geometrical laws, that reign in the universe, their cause, the innumerable ends of all things, I am seized with admiration and respect. I immediately judge, that if the works of man, even my own, compel me to acknowledge an intelligence within us, I should acknowledge one far more superior, actuating the multitude of so many works. I admit of this supreme intelligence, without fearing that I shall be obliged to change my opinion. Nothing staggers me with respect to this axiom, every work demonstrates a workman.

XVI. ETERNITY

Is this intelligence eternal? Doubtless, for whether I admit or reject the eternity of matter, I cannot reject the eternal existence of its supreme artizan; and it is evident that if it exists at present, it ever has existed.

XVII. INCOMPREHENSIBILITY

I have as yet advanced only two or three steps in this vast career; I want to know if this divine intelligence is something absolutely distinct from the universe, nearly as the sculptor is distinguished from the statue; or whether this soul of the world is united to the world, and still penetrates it nearly in the same manner, as what I call my soul is

united to me, and according to that of antiquity so well expressed in Virgil and Lucan:

Mens agitat molem and magno se corpore miscet,

Jupiter est quodcumque vides quocomque moveris.

I find myself suddenly interrupted in the prospect of my vain curiosity. Miserable mortal, if I cannot fathom my own intelligence if I cannot know by what I am animated, how can I have any acquaintance with the ineffable intelligence which visibly presides over matter entirely? There is one, as everything demonstrates, but where is the compass that will direct me towards its secret and eternal abode?

XVIII. INFINITY.

Is this intelligence infinite in power and immensity, as it is incontestably infinite in duration? I can know nothing of this by myself. It doth exist wherefore it hath ever existed, that is clear. But what idea can I have of an infinite power? How can I conceive an infinity actually existing? How can I suppose that the supreme intelligence is in the vacuum? An infinity of extent is not the same as an infinity of duration. An infinity of duration is elapsed, the instant that I am speaking of it; it is certain, that I can add nothing to past duration, but I can always add to that space which

I conceive, in the same manner that I can add to the numbers that I conceive. Infinity in numbers and extent is beyond the sphere of my understanding. All that can be said can give me no insight into this abyss. I happily feel that my difficulties and my ignorance can be no way pernicious to morality; we may very well be incapable of perceiving neither immensity of space replenished, nor infinite power which has created every thing, and which may nevertheless be still able to perform; this will only serve to prove still more the weakness of our understanding; and this weakness will render us only more submissive to the eternal Being, whose work we are.

XIX. MY DEPENDENCE.

We are his work. This is an important truth for us to know; for to know philosophically at what time he made man, what he did before, if he exists materially, or in vacuum, if he is at one point. if he constantly acts or not, if he acts everywhere, if he acts without or within himself; these are researches which strengthen the conviction of my profound ignorance.

I even see that there has been scarce a dozen men in Europe who have written upon these abstracted things with any kind of method; and if I could suppose that they had spoken in an intelligible manner, what would be the consequence? We have already found (No. IV.) that things which so few persons

can flatter themselves with understanding, are useless to the rest of mankind. We certainly are the work of God, this is useful for me to know; and the proof is also clear. All things in my body are causes and effects; that is, spring, pulley, moving power, hydraulic machine, equilibrium of fluids, and chemical laboratory. It is therefore arranged by an intelligence, (No. XV.) I am not indebted for this arrangement to the intelligence of my parents, for they certainly did not know what they did when they produced me: they were only the blind instruments of this eternal manufacturer, who animates the worm of the earth, and makes the sun turn upon its own axis.

XX. ETERNITY AGAIN.

Born from seed, produced by other seed, has there been a continual succession, an unfolding without end of these seeds, and has all nature ever existed by a necessary succession from that Supreme Being, who existed of himself? If I were to believe only my feeble understanding, I should say, it seems to me, that nature has always been animated. I cannot conceive that the cause which continually and visibly actuates her, being at all times able to act, has not always acted. An eternity of idleness in the active and necessary being, appears to me incompatible. I am inclined to believe, that the world has ever issued from that primitive and necessary cause, as

light emanates from the sun. By what a concatenation of ideas do I find myself led to believe the works of the eternal being eternal? My conception pusillanimous as it is, has strength enough to rise to a being necessarily existing by himself; but has not the strength to conceive nought. The existence of a single atom proves to me the eternity of existence, but nothing proves to me a mere void. What? is that space filled that was once a vacuum? This appears absurd and contradictory. I cannot allow of this nothing, this void, unless revelation assists me in fixing my ideas, which carry me beyond time.

I am sensible that an infinite succession of beings without origin, is equally absurd: this is the opinion of Samuel Clarke: but he does not undertake to affirm that God has not held this chain from all eternity; he dare not say that it was impossible for a Being eternally active, so long to display his works. It is evident that he could, and if he could, who will be bold enough to tell me that he did not? I say, once more, that nothing but revelation can teach me the contrary. But we have not yet attained that revelation which destroys all philosophy, that light before which all other lights are eclipsed.

XXI. MY DEPENDENCE AGAIN.

This eternal being, this universal cause, gives me my ideas; for I don't receive them from objects. Unshaped matter cannot com-

municate any thoughts to me; my thoughts do not come from myself, for they occur against my will, and frequently escape the same. We know very well there is no resemblance, no connection between objects, our ideas, and sensations. There was certainly something sublime in that Mallebranche, who dared to imagine that we see everything in God himself. But was there not something sublime in the Stoics, who thought that God acted within us, and that we possess a ray of his substance? Where shall we find truth between the dreams of Mallebranche and the Stoics? I sink again (No. II.) into ignorance, which is the appendage of our nature, and I adore that God by whom I think, without knowing how I think.

XXII. A FRESH DOUBT.

Convinced by my small share of reason, that there is a necessary eternal Being, from whom I receive my ideas, without being able to divine how or wherefore, I ask what is this being? If it hath the form of those intelligent and active species superior to ours in other globes? I have already said I knew nothing of the matter (No. I.) Nevertheless, I cannot affirm it to be impossible; for I perceive planets very superior to ours in extent, surrounded with more satellites than the earth. It is not improbable that they may be peopled with intelligences far superior to me, with bodies more robust, more active and more durable.

But their existence having no connection with mine, I shall leave it to the poets of antiquity, to make Venus descend from her imaginary third heaven, and Mars from the fifth. My enquiries should be confined to the action of the Being necessarily presiding over myself.

XXIII. A SOLE SUPREME ARTIST.

A great part of mankind observing the physical and moral evil diffused through this globe, imagined there were two powerful beings, one of which produced all the good, and the other all the evil. If they existed they were necessary; they therefore necessarily existed in the same place; there is no reason that what exists by its own nature should be excluded any place; they therefore penetrated each other—this is absurd. The idea of these two powerful enemies can derive its origin only from examples that strike us upon earth; we there observe gentle and ferocious men, useful and obnoxious animals, good masters and tyrants. There were two opposite powers devised, who presided over nature; this is only an Asiatic romance. There is throughout nature a manifest unity of design; the laws of motion and gravity are invariable; it is impossible that two supreme artists, in opposition to each other, could have followed the same laws. This alone has, in my opinion, overturned the Manichean system, and voluminous writings are superfluous to explode it.

There is then a sole eternal Power, to whom

everything is united, on whom all depends; but whose nature is to me incomprehensible. St. Thomas tells us, "That God is a pure act, a form that has neither gender nor predicament, that he is nature and the agent, that he exists essentially, participatively, and noncupatively." When the Dominicans were masters of the inquisition, they would have burnt a man who would have denied these fine things—I should not have denied them, but I should not have understood them.

I am told that God is simple; I acknowledge that I do not understand any more the value of this word. It is true, that I should not attribute to him gross parts that I could separate; but I cannot conceive that the principal and master of all that is in the extent, should not be in the extent. Simplicity, strictly speaking, appears to me to resemble too much a nonentity. The extreme weakness of my understanding has no instrument nice enough to lay hold of this simplicity. Shall I be told that the mathematical point is simple; but the mathematical point does not really exist.

It is again said that an idea is simple, but I do not understand this a whit better. I perceive a horse, I have the idea of it, but I see in him only an assemblage of things. I see a color, I have the idea of color; but this color is extent. I pronounce the abstracted names of color in general; of vice, virtue, truth, in general; but the reason is, that I have had a knowledge of things colored, of things that have appeared to me virtuous or vicious, true

or false. I express all this by a word; but I have no clear knowledge of simplicity. I know no more of it than I do of an infinity in numbers actually existing.

I am already convinced that not knowing what I am, I cannot know what is my author. I am every instant overwhelmed with my ignorance, and I console myself by incessantly reflecting that it is of no consequence to me to know, whether my master is or not in the extent, provided I do nothing against that conscience he has given me. Of all the systems which men have invented upon the Divinity, which, then, shall I embrace? Not one, without it be that of adorning him.

XXIV. SPINOZA.

After being immersed with Thales in the water, of which his first principle consisted; after glowing before Empedocles's fire; after running in a straight line in the vacuum, with Epicurus's atoms; after having calculated numbers with Pythagoras, and heard his music; after having paid my respect to the Androgines of Plato, and having passed through all the regions of metaphysics and madness; I was at length desirous of being acquainted with the system of Spinoza.

He is not new; he has imitated some ancient Greek philosophers, and even some Jews; but Spinoza has done what no Greek philosopher, and much less a Jew, ever did. He has used an imposing geometrical method to calculate

the net produce of his ideas. Let us see if he has not methodically wandered with the thread that conducts him.

He at first establishes a clear and incontestable fact. There is something, consequently there has eternally existed a necessary Being. This principle is so true, that the profound Samuel Clarke has availed himself of it, to prove the existence of God.

This Being must be found in all places where there is existence; for who can limit it?

This necessary being is then everything that exists: wherefore there is only one substance in the universe.

This substance cannot create another; for as it fills everything, where can a new substance be placed, and how can something be created from nothing? How can extent be created without placing it in extent itself, which necessarily exists?

There are in the world thought and matter; that necessary substance which we call God is therefore thought and matter. All thought and all matter are then comprehended in the immensity of God; there can be nothing out of him; they can only act within him; he comprehends everything, he is everything.

Wherefore everything we call different substances is, in fact, nothing but the universality of the different attributes of the Supreme Being, who thinks in the brain of man, enlightens in the light, moves upon the winds, darts in the lightning, revolves in the planets,

and exists in all nature.

He is not like a vile king of the earth confined to his place, separated from his subjects; he is intimately united with them; they are essential parts of himself; if he were distinguished from them he would be no longer universal, he would not fill all space, he would be a side being like another.

Though all the variable modifications in the universe are the effect of his attributes, nevertheless, according to Spinoza, he hath no parts; for, says he, Infinity has none, properly speaking. In fine, Spinoza pronounces that we must love this necessary, infinite, eternal God. These are his words (p. 45, Edit. of 1731.)

“With regard to the love of God, this idea is so far from weakening it, that I think no other is so fit to increase it, since it teaches me that God is intimate with my being, that he gives me existence and all my properties,—that he gives them to me liberally, without reproach, without interest, without subjecting me to anything but my own nature. It banishes fear, uneasiness, difference, and all the defects of a mean and sordid love. **It teaches** me that it is a good I cannot lose, and which I the more advantageously possess, as I know and love it.”

These ideas seduced many readers; there were even some, who having at first written against him, afterwards embraced his opinion.

The learned Bayle is upbraided with having severely attacked Spinoza, without under-

standing him. Severely, I agree to; but I do not think unjustly. He easily discovered the weak side of this enchanted castle: he saw that Spinoza, in fact, composed his God of parts, though he found himself compelled to retract, terrified at his own system. Bayle saw his frenzy in making God a star and a pumpkin, thought and smoke, beating and beaten. He saw that this fable is much beneath that of Proteus. Perhaps Bayle should have confined himself to the word modalities, and not parts, as Spinoza always makes use of the word modalities. But if I am not mistaken, it is equally impertinent, whether the excrement of an animal is a modality or a part of the Supreme Being.

He did not indeed attack the reason by which Spinoza maintains the impossibility of the creation; but the reason is, that the creation, properly speaking, is an object of faith, and not of philosophy: because this opinion is no way peculiar to Spinoza, and all antiquity have thought like him. He attacks only the absurd idea of a simple God, composed of parts, of a God that eats and digests himself, who loves and hates the same thing at the same time, etc. Spinoza constantly makes use of the word God, and Bayle takes him according to his own expressions.

But at the bottom, Spinoza does not acknowledge any God; he has probably made use of this expression, he has said that we should serve and love God, only that he might not startle mankind. He appears to be an atheist,

according to the full extent of the epithet; he is not such an atheist as Epicurus, who acknowledged useless and lazy gods; he is not like the greater part of the Greeks and Romans, who ridiculed the gods of the vulgar; he is such, because he acknowledges no providence whatever, because he admits only of eternity, immensity, and the necessity of things; like Stratonius, like Diagoras; he does not doubt like Pyrrha, he affirms, and what does he affirm? That there is only a single substance, that there cannot be two, that this substance is extended and pendant, and this is what none of the Greek or Asiatic philosophers ever said, as they admitted of a universal soul.

He nowhere mentions in his book specified designs, which are manifested in all beings. He does not examine whether eyes were made to see with, ears to hear, feet to walk, or wings to fly; he neither considers the laws of motion in animals and plants, nor their structure adapted to those laws, any more than the depth of mathematics, which governs the course of the stars: he is afraid to perceive that everything which exists attests a divine providence; he does not rise from effects to their cause, but immediately placing himself at the head of the origin of things, he builds his romance in the same manner as Descartes constructed his, upon a supposition. He supposes, with Descartes, a plenum, though it has been strictly demonstrated that all motion is impossible in a plenum. This was his princi-

pal reason for looking upon the universe as one single substance. He was the dupe to his geometrical genius. How came it that Spinoza, who could not doubt that spirit and matter existed, did not at least examine whether providence had not arranged everything? How came it that he did not give a single glance towards those springs, those means, each of which hath its design, and enquired whether they evinced a supreme artist? He must either have been a very ignorant physician, or a sophist swelled up with a very stupid kind of pride, not to acknowledge a providence every time he breathed and felt his heart beat; for this respiration and this motion of the heart are the effects of a machine so industriously complicated and arranged with such powerful art, depending upon so many springs, all concurring to the same end, that is impossible to be imitated, and impossible for a man of good sense not to admire it.

The modern Spinozists reply, Do not terrify yourselves at these consequences, which you impute to us; we find, as you do, a succession of admirable effects in the organized bodies, and in all nature. The eternal cause is in the eternal intelligence, which we admit, and which, with matter, constitutes the universality of things, which is God. There is but one single substance, which acts by the same modality of its thought upon the modality of matter, and which thus constitutes the universe, which forms but one whole inseparable thing.

To this reply we answer: How can you prove to us, that the thought which gives motion to the stars, which animates man, which doth everything, can be a modality, and that the excrements of a toad and a worm should be a modality of the same sovereign Being? Will you dare to say that so strange a principle is demonstrated to you? Do you not cloak your ignorance beneath words that you do not understand? Bayle has thoroughly unfolded the sophisms of your master in all the windings and all the obscurities of the style of a pretended and really much confused geometriician, which is that of his master. I refer you to him; philosophers should not exclaim against Bayle.

Be this as it may, I shall observe of Spinoza, that he very honestly deceived himself. It seems to me, he did not suppress in his system those ideas which might be troublesome to him, only because he was too full of his own; he went on in his own road, without observing anything that might interrupt him, and this is what very often happens to us. Moreover, he inverted all the principles of morality, though he was himself a rigid moralist; so particularly sober, that he scarce drank a pint of wine a month; so disinterested as to transfer to the heirs of the unfortunate John de Wit a pension of two hundred florins, which this great man had granted him: so generous as to give away his fortune; ever patient in his illness and in his property, ever consistent in his conduct.

Bayle, who has so ill treated him, had nearly the same character. Each of them sought after truth all their lives by different roads. Spinoza frames a specious system in some respects, and very erroneous in the foundation. Bayle has combated all systems: what became of their writings? They have prevented the idleness of some readers, and this is the full scope of all writing; and from Thales, down to the professors of our universities, and the most chimerical reasoners, as well as their plagiarists, no one philosopher has influenced the manner of the very street he lived in. What is the reason? Because men are led by custom, not by metaphysics.

XXV. ABSURDITIES.

There are many voyages made in unknown countries productive of no advantage. I am in the situation of a man, who having wandered upon the ocean, and perceiving the Maldivian Islands with which the sea of India is interspersed, is desirous of visiting them all. My long voyage has been of no avail to me; let me see if I can reap any benefit by my observations upon these little islands, which seem only to interrupt the passage.

In a hundred courses of philosophy, such things are explained to me, of which nobody can frame the least idea. By this I am taught to comprehend the Trinity physically; it says that it resembles three dimensions of matter. Go on, and so will I. That pretends to com-

municate to me transubstantiation by the touch, by showing me according to the laws of motion, how an accident may exist without a subject, and how one single body may be in two places at the same time. I shut my ears, and retire with still greater precipitation.

Pascal, Blaise Pascal himself, the author of the Provincial Letters, utters these words: "Do you believe that it is impossible that God may be infinite and without parts? I will then show you a thing indivisible and infinite; this is a point moving everywhere with infinite swiftness, for it is in every place, and everywhere, quite entire."

A mathematical point that moves of itself! just heaven! a point that exists nowhere but in the head of a geometrician, which is everywhere at the same time, of infinite swiftness, as if actual infinite swiftness could exist! Every word is frenzy and he was a great man that uttered these frenzies!

Your soul, says another, is simple, incorporeal, intangible; and, as no body can touch, I shall prove, according to the physics of Albert the Great, that it will be physically burnt, if you are not of my opinion: this is the way I prove it to you *a priori*, in strengthening Albert with the syllogisms of Abeli.

I reply to him, I do not understand his *priori*; that I think his compliment is very harsh; that revelation, which we have nothing to do with, can alone teach me a thing so incomprehensible; that I allow him to differ

from me in opinion, without threatening him: and I get a good distance from him for fear of an accident, for he seems to be a dangerous man.

A multitude of sophists of all countries overwhelm me with unintelligible arguments upon the nature of things; upon my own, upon my past, present and future state. If one talks to them of eating and clothing, lodging, the necessaries of life, money by which they are procured, they are perfectly conversant in these things; are there a few pistoles to be got, each of them is eager to obtain them, and they do not make a mistake of a farthing; but when the question is concerning our being, they have not one clear idea about it. Common sense deserts them. From hence I return to my first conclusion (No. IV.) that what cannot be of universal use, what is not within the reach of common men, what is not understood by those who have most exercised their faculty of thinking, is not necessary to mankind.

XXVI. OF THE BEST OF WORLDS.

In my various peregrinations in search of instruction, I met with some disciples of Plato. Come along with me, said one of them, you are in the best of worlds; we have far surpassed our master. There were in his time only five possible worlds, because there are but five regular bodies; but now there are an infinity of possible universes; God has chosen the best;

come and you will be satisfied with it.

I humbly replied, The worlds which God might create, were either better, perfectly equal, or inferior. He could not choose the worst. Those which were equal, supposing such to be, could have no preference; they were ever completely the same; there could have been no choice amongst them; to fix upon one or the other was just the same. It was therefore impossible that he could avoid choosing the best. But how could the others be possible, when it is impossible they can exist?

He made some very curious distinctions, incessantly assuring me, without knowing what he said, that this world is the best of all really possible worlds. But being just then tortured with the stone, which gave me an almost insupportable pain, the citizens of the best of worlds conducted me to the neighboring hospital. In the way two of these perfectly happy inhabitants were carried off by two creatures of their own likeness. They were loaded with irons, the one for debt, the other upon mere suspicion.

I know not whether I was conducted into one of the best possible hospitals; but I was crowded amongst two or three thousand wretches like myself. Here were many defenders of their country, who informed me, that they had been trepanned and dissected alive; that they had had arms and legs cut off; and that many thousand of their generous fellow-countrymen had been massacred in one

of the thirty battles fought in the last war, which is about the hundredth million war since we have been acquainted with wars.

One might also meet in this house about a thousand persons of both sexes, who resembled hideous spectres, and who were rubbed with a certain metal, because they had followed the law of nature, and nature had, I know not how, taken the precaution of poisoning in them the source of life. I thanked my two conductors.

After a very sharp iron had been thrust into my bladder, and some stones were extracted from this quarry,—when I was cured, and I had no further complaints than a few disagreeable pains for the rest of my days, I made my representations to my guides.

I took the liberty of telling them there was some good in this world, as the surgeons had extracted four flints from my torn entrails; but that I would much rather that bladders had been lanterns than quarries. I spoke to them of the innumerable calamities and crimes that were dispersed over this excellent world.

The boldest of the two, who was a German and my countryman, told me that all this was a mere trifle.

Heaven was peculiarly propitious to man when Tarquin violated Lucretia and she stabbed herself, because the tyrants were thereupon driven out, and rapes, suicides and war laid the foundation of a republic which conferred happiness upon those they vanquished.

I had some difficulty in agreeing to this hap-

piness. I did not immediately conceive the felicity of the Gauls and Spaniards, of whom it is said Caesar put three millions to the sword.

Devastation and rapine appeared to me things somewhat disagreeable, but the defender of optimism did not quit his hold; he persevered in telling me, like Don Carlos's jailer, "Peace, peace, it is for your good."

Having, however, at length run him pretty hard, he said, that "we should not consider this mere globule, where every thing is jarring; but that in the star Sirius, in Orion, the Ox's-Eye and elsewhere, everything is perfect."

"Let us, then, go thither," said I.

A little theologian then took me by the arm. He told me, in confidence, that "those folks were very dreamers; that it was not in the least necessary that there should be any evil upon earth; that it was expressly formed that there never should be any thing but good; and in order to prove this, you must know that things formerly went on in this manner in Eden for ten or twelve days."

"Alas!" I replied to him, "it is a great pity, reverend father, that things did not continue so."

XXVI. OF MONADS.

The same German then laid hold of me again. He tutored me, and clearly taught me the nature of my soul.

"Every thing in nature," said he, "consists

of monads. Your soul is a monad, and as it is united with all the others, it necessarily has ideas of all that passes in them. These ideas are confused, which is very necessary; and your monad, as well as mine, is a concentric mirror of the universe.

"But believe not that you act in consequence of your thoughts. There is a pre-established harmony between the monad of your soul and the monads of your body, so that when your soul hath an idea, your body has a motion, without the one being the result of the other. They are two pendulums that go together; or, if you will, the one resembles a man who preaches, whilst another makes gesticulations. You easily conceive that this must necessarily be so in the best of worlds; for—

XXVIII. OF PLASTIC FORMS

As I have no comprehension of these admirable ideas, an Englishman, named Cudworth, discovered my ignorance and my embarrassment by my fixed eyes and downcast look.

"These ideas," he said, "appear deep to you, because they are well sifted. I will give you a concise notion of the manner in which nature acts. First, there is nature in general, then, there are plastic natures, which form all animals and all plants.—You understand me?"

"Not a word, Sir."

"Let us go on then."—

"A plastic nature is not a corporeal faculty;

it is an immaterial substance, which acts without knowing what it does, being entirely blind and insensible to reason and to vegetation. But the tulip has its plastic form, which makes it vegetate; the dog has also its plastic form, which makes it pursue the chase, and man has his, which makes him reason. These forms are immediate agents of the divinity. There are no ministers in the world more faithful; for they yield everything, and keep nothing for themselves.

"You see very well that these are the true principles of things, and that plastic natures are at least equal to pre-established harmony and monads, which are the concentrical mirror of the universe." I acknowledged to him that the one was as good as the other.

XXIX. OF LOCKE.

After so many unfortunate excursions, fatigued, harrassed, ashamed of having sought after so many truths, and found so many chimeras, I returned to Locke, like the prodigal son who returned to his father. I threw myself into the arms of a modest man, who never pretends to know what he is really ignorant of; who, in fact, is not possessed of immense riches, but whose security is always good, and who enjoys the most permanent wealth without ostentation.

He confirms me in the opinion I always entertained, that nothing obtains a place in our understanding but through our senses:

That there are no innate ideas:

That we can neither have the ideas of infinite space nor infinite number:

That I do not always think, and consequently that thought is not the essence, but the action of my understanding.

That I am free when I can do what I please:

That this liberty does not consist in my will, since when I remain voluntarily in my chamber, the door of which is locked, without my having the key, I am not at liberty to go out; as I suffer when I am not willing to suffer; as I frequently cannot recall my ideas when I am disposed to recall them.

It is, therefore, in fact, absurd to say that the will is free, as it is absurd to say, I will such a thing; for this is precisely as if one were to say, I desire to desire it, I fear to fear it. In a word, the will is no more free than it is blue or square. (See Article XIII.)

That I can only form a will in consequence of ideas received in my brain; that I am necessitated to determine in consequence of those ideas, as I should otherwise determine without reason, which would be an effect without a cause:

That I cannot have a positive idea of infinity, as I am absolutely finite.

That I cannot know any substance, as I can have no ideas but of their qualities, and that a thousand qualities of a thing cannot communicate the intimate nature of this thing, which may possess a hundred thousand other qualities that I am unacquainted with:

That I am no longer the same person after I have lost my memory; for not having the smallest part of my body which belonged to me in my infancy, and not having the least remembrance of the ideas that affected me at that age, it is clear that I am no longer that same child any more than I am Confucius or Zoroaster.

I am reputed the same person by those who have observed me grow, and who have always resided with me; but I have in no respect the same existence; I am no longer my former self; I am a new identity; and what singular consequences must hence arise!

That, in fine, agreeable to my profound ignorance, of which I am convinced, according to the principles of things, it is impossible that I can know what are the substances to which God designs to grant the gifts of feeling and thinking. In fact, are there any substances the essence of which is to think, that always think, and which think by themselves? In this case these substances, whatever they be, are gods; for they have no occasion for the eternal Being and Creator, as they possess their essences without him—as they think without him.

Secondly.—If the eternal Being has communicated the gifts of feeling and thinking to these beings, he has given them what did not essentially belong to them; he could therefore have given this faculty to all beings whatever.

Thirdly.—We are unacquainted with the inward recesses of any being; wherefore it is

impossible for us to know whether a being is susceptible or insusceptible of sensation and thought.

The words matter and spirit are mere words. We have no complete idea of these two things. Wherefore, in fact, it would be as bold to say that a body organized by God himself cannot receive thought from God himself, as it would be ridiculous to urge that spirit could not think.

Fourthly.—I imagine there are substances purely spiritual, which never had any idea of matter and motion; would it be thought proper for them to deny that matter and motion may exist?

I suppose that the learned congregation who condemned Galileo for impiety and absurdity—for having demonstrated the motion of the earth round the sun, had obtained some knowledge of the ideas of chancellor Bacon, who proposed to examine whether attraction be given to matter. I suppose that he who made the report of this great tribunal remonstrated to these great personages, that there were people mad enough to suspect that God could communicate to all matter from Saturn down to our little lump of earth, a tendency towards a center,—attraction, gravitation,—which would be absolutely independent of all impulse; as impulse acts upon surfaces, and this gravitation actuates solids.

Do you not find these judges of human reason, and of God himself, immediately dictate their sentences, anathematize this gravitation,

(which Newton has since demonstrated,) pronounce it impossible for God to perform, and that gravitation towards a center is blasphemy?

I am, methinks, guilty of the same temerity, when I dare aver that God cannot make any organized being whatever feel and think.

Fifthly.—I cannot doubt that God has granted sensations of the memory, and consequently ideas, to the organized matter in animals. Wherefore, then, should I deny that he may make the same present to other animals? It has already been observed, that the difficulty consists less in knowing whether organized matter can think, than in knowing how any being whatever can think.

Thought is something divine; yes, doubtless, and therefore I never shall know what a thinking being is. The principal motion is divine; I shall never know the cause of this motion, the laws whereof all my members execute.

Aristotle's child being at nurse, attracted into his mouth the nipple which he sucked, forming with his tongue, which he drew in, a pneumatic machine, pumping the air, and causing a vacuum: whilst his father, quite ignorant of this, said at random, that "nature abhors a vacuum."

The child of Hippocrates, at four years of age, proved the circulation of the blood by passing his finger over his hand; and Hippocrates did not know that the blood circulated.

We are all, great as we may be, like those children; we perform admirable things, and

there is not a single philosopher who knows how they are done.

Sixthly.—These are the reasons, or rather the doubts, produced by my intellectual faculty upon Locke's modest assertion. Once more, I do not say that it is matter which thinks within us. I say with Locke, that it does not belong to us to assert that it should be impossible for God to make matter think; that it is absurd to declare it; and that it is not for worms of the earth to limit the power of the Supreme Being.

Seventhly.—I add that this question is absolutely foreign to morality: because whether matter can, or cannot think, whoever thinks must be just; because the atom to which God shall have given thought may be worthy or unworthy, be punished or recompensed, and exist eternally, as well as the unknown being formerly called *breath* and at present *spirit*, of which we have a less idea than even an atom.

I know very well that those who thought the being called *breath* could alone be susceptible of feeling and thinking, have persecuted those who have followed the sagacious Locke, and who have not dared to limit the power of God to animating only this *breath*. But when the whole universe believed that the soul was a light body, a *breath*, a substance of fire, would it have been just to persecute those who came to teach us that the soul is immaterial?

All the fathers of the church who thought the soul an extended body, would they have

done right to persecute the other fathers who communicated to man the idea of perfect immateriality?

No, doubtless; because a persecutor is an abominable character. Wherefore those who allow of perfect immateriality, without comprehending it, should have tolerated those who rejected it, because they did not comprehend it.

Those who have refused God the power of animating the unknown being called matter, should also have tolerated those who have not dared to divest God of his power; for it is very scandalous to hate one another for syllogisms.

XXX. WHAT HAVE I THUS FAR LEARNED.

I have then reckoned with Locke and with myself, and I find myself possessed of four or five truths, abstracted from a hundred errors, and loaded with an immense quantity of doubts. I said to myself afterwards,—These few truths which I have acquired by my reason, will be but barren land in my hands, if I can find no principle of morality in them. It is very fit for such an insignificant animal as man to raise himself up to the knowledge of the master of nature. But this will be of no more service to me than the science of algebra, if I do not derive from it some rule for the conduct of my life.

XXXI. IS THERE ANY MORALITY.

The more I have observed men differ by climate, manners, languages, laws, doctrine, and the measure of their understanding, the more I have observed they have the same fund of morality. They have all a barbarous notion of justice and injustice, without knowing a word of theology. They have all acquired this notion at an age when reason begins to unfold itself: as they have naturally acquired the art of raising burdens with poles, and passing a rivulet upon a piece of wood, without having learned the mathematics.

It therefore appeared to me that this idea of justice and injustice was necessary for them, because they all agreed in this point, as soon as they could act and reason.

The supreme intelligence which formed us has then been pleased that there should be justice upon earth, that we might live there for a certain time.

It appears to me, that having neither instinct to nourish ourselves like animals, nor natural arms like them, and vegetating for several years in the imbecility of infancy, exposed to every danger, the few men that would have escaped from the jaws of ferocious animals, from famine and misery, would have been employed in wrangling for a little nourishment and a few skins of animals; and they would have been destroyed like the children of the dragon of Cadmus, as soon as they would

have been able to have used any arms.

At least, there would have been no society, if men had not conceived the idea of some justice, which is the tie of all society.

How would the Egyptians, who raised pyramids and obelisks, and the wandering Scythians, who were even unacquainted with a cabin, have had the same fundamental notions of justice and injustice, if God had not given to each of them, from the beginning of time, that reason which, in unfolding itself, made them perceive the same necessary principles, in the same manner as he gave them affections and passions, which having attained the degree of their development, necessarily perpetuate in the same manner the race of the Scythian and the Egyptian?

I perceive a barbarous, ignorant, superstitious herd, a bloody and a furious people, who had not even a term in their jargon to signify geometry and astronomy. This people hath nevertheless, the same fundamental laws as the wise Chaldean, who was acquainted with the course of the stars, and the Phenician, still more learned, who availed himself of the knowledge of the stars to go and lay the foundation of colonies at the extremity of the hemisphere, where the ocean mingles with the Mediterranean. All these people aver that they should respect their father and mother; that perjury, calumny, and homicide are abominable crimes: they therefore derive the same consequences from the same principles of their unfolded reason.

XXXII. REAL UTILITY. THE NOTION
OF JUSTICE.

The notion of something just, appears to me so natural, so universally received by all men, that it is independent of all law, of all compact, of all religion.

Let me ask a Turk, a Guebrian or a Malabar, for the money I lent him, to enable him to eat and clothe himself, and he will never think of replying: "Wait till I learn if Mahomet, Zoroaster, or Brama commands me to restore your money."

He will acknowledge that it is just that he should pay me, and if he doth not perform it, either his poverty, or his avarice, predominates over the justice which he acknowledges.

I assert it as a fact, that there are no people who maintain, that it is either just, right, proper, or honest, to refuse nourishment to one's father or mother, when it is practicable to bestow it.

That no community has ever considered calumny as a good action, not even a sect of bigoted fanatics.

The idea of justice appears to me so much a truth of the first order, to which the whole universe has given its assent, that the greatest crimes which afflict society are all committed under the false pretence of justice. The greatest of all crimes, at least that which is the most destructive, and consequently the most opposite to the design of nature, is war;

but there never was an aggressor who did not gloss over his guilt with the pretext of justice.

The Roman depredators had all their invasions declared just, by priests named Fecials.

Every free-booter, who finds himself at the head of an army, begins his foray by a manifesto, and implores the God of armies.

Petty thieves themselves, when united in a society, take care not to say, "let us go and rob, let us go and despoil the widow and the orphan of their scanty pittance," but they say, "let us be just, let us recover our fortune from the hands of the rich, who have deprived us of it."

They have even a dictionary among them, which has been printed since the sixteenth century, and in this vocabulary, which they call Argot, the words theft, robbery, rapine, are not to be met with. They make use of terms which correspond with gaining, reimbursing, etc.

The word injustice is never uttered in a council of state, where the most unjust murder is proposed. Even the most bloody conspirators have never said, "let us commit a crime." They have ever said, "Avenge our country for the crimes of a tyrant; let us punish what appears to us unjust."

In a word, servile flatterers, barbarous ministers, odious conspirators, the most infamous robbers, all pay homage against their will, to that virtue they trample upon.

I have been greatly astonished that amongst the French, who are enlightened and polished, maxims have been repeated upon the stage which are equally as shocking as false.

La justice et le droit font des vaines idees,
Le droit des rois consiste a rien epargner.

"Justice and right are vain ideas, the right of kings consists in sparing nothing."

And this abominable speech is put in the mouth of Phocian, minister to young Ptolemy. But it is precisely because he is a minister that he should say the contrary; he should represent the death of Pompey as a necessary and just misfortune.

I believe, then, that the ideas just and unjust, are as clear and universal as the ideas of health and sickness, truth and falsehood, convenience and inconvenience.

The limits of justice and injustice are very difficult to fix; as the middle state between health and disease, between the convenience and the inconvenience of things, between falsehood and truth, is difficult to specify. They are shades that are interwoven; but glaring colors strike every eye.

For example, all men agree that we should restore what we have borrowed; but if I know that the person to whom I am indebted two millions will make use of it to enslave my country, should I put such fatal arms into his hands? Here are sentiments that are divided; but in general I should observe my oath when no evil results from it. This is what no one ever doubted.

XXXIII. IS UNIVERSAL CONSENT A
PROOF OF TRUTH.

It may be objected that the consent of men at all times, and in all countries, is not a proof of truth. All people believed in the Magi, in sorcery, demons, apparitions, planetary influence, and a hundred other such like follies. Might it not be the same with respect to justice and injustice?

It appears to me not. First, it is false that all men believed these chimeras. They were, in fact, aliment to the weakness of the vulgar; but a great number of sages constantly ridiculed them. These numerous wise men, on the contrary, always admitted of justice and injustice, as much and even more than the people.

The belief in sorcerers, demons, etc., is far from being necessary to mankind; the belief in justice is absolutely necessary, because it is an unfolding of that reason given by God; and the idea of sorcerers, people possessed, etc., is on the contrary, a perversion of this same reason.

XXXIV. AGAINST LOCKE.

Locke, who instructs and teaches me to mistrust myself, does he not sometimes impose upon himself like many others? He wants to prove the falsity of innate ideas; but does he not add a very bad reason to several good

ones? He acknowledges it is not just to boil one's neighbor in a cauldron and eat him. He nevertheless says there have been nations of Anthropophagi; and that these thinking beings would not have eaten men, if they had possessed the ideas of justice and injustice, which I suppose is necessary for the preservation of the human species. (See No. XXXVI.)

Without entering into a disquisition, whether there were in fact any nations of Anthropophagi,—without examining the relations of the traveler Dampier, who traversed all America, and who never saw any, but who, on the contrary, was received amongst all the savages with the greatest humanity: I reply as follows:

Conquerors have eaten their slaves taken in war. They imagine they did a very just action. They imagined they had a right over their life and death; and, as they had but few good meats for their table, they thought they were allowed to feed upon the fruit of their victory.

They were in this more just than the Romans, who, without reaping any advantages, strangled the captive princes that were chained to their triumphal cars.

The Romans and the savages had a very false idea of justice, I allow; but they, however, both thought they acted justly. And this is so true, that the same savages, when they had admitted these captives into their society, looked upon them as their children; and the same ancient Romans have given a thousand examples of admirable justice.

XXXV. AGAINST LOCKE.

I agree with the sagacious Locke, that there is no innate idea—no innate principle of practice. This is such an incontrovertible truth, that it is evident that all children would have a clear notion of God if they were born with this idea, and all men would then agree with this same notion—an agreement that has never been known.

It is also evident that we are not born with innate principles of morality, as we do not see how a whole nation could reject a principle of morality which had been engraven on the heart of every individual of that nation.

I suppose that we are all born with the moral principle well understood, that no person should be persecuted for his manner of thinking. How could whole communities become persecutors? I suppose that every man carries within himself that evident law whereby he is commanded to be faithful to his oath. How could all men, united in a body, have enacted that no faith should be kept with heretics?

I repeat again, that instead of these chimerical innate ideas, God has given us reason, which is strengthened with age, and which teaches us all, when we are attentive without prejudice, that there is a God, and that we should be just. But I cannot grant Locke the consequences he draws from thence. He seems to approach too near Hobbes' system,

though, in fact, he is very distant from it.

These are his words in the first book of his *Essay upon the Human Understanding*.

"View but an army at the sacking of a town, and see what sense of moral principles, or what touch of conscience they exhibit for all the outrages they do."

No, they have no remorse, and why? Because they believe they act justly.

Not one amongst them imagines the cause of the Prince for whom they are fighting to be unjust. They risk their life for their cause—they fulfill the bargain they have made. They might have been killed in the assault, they therefore think they have a right to kill; they might have been plundered, they therefore think they may plunder.

Add to this, that they are intoxicated with fury, which does not reason. And to convince you that they have not divested themselves of the idea of justice and honesty, propose to these same soldiers much more money than the plunder of the city, handsomer women than those they have violated, upon condition only that instead of murdering in their rage three or four thousand enemies, who still make resistance, and who may kill them, they go and cut the throats of their king, his chancellor, his secretaries of state, and his high almoner, you will not find a single soldier who does not reject your proposal with horror: and yet you propose but six murders, instead of four thousand, and you present them with a very valuable recompense.

Why do they refuse you? Because they think it is just to kill four thousand enemies; but the murder of their sovereign, to whom they are bound by a solemn oath, appears to them abominable.

Locke continues his argument, and to prove the better that no rule of conduct is innate, he speaks of the Mengrelians, who out of sport, he says, bury their children alive; and of the Caribbees, who fatten them, in order to eat them.

It has already been observed that this great man was too credulous in relating these fables. Lambert, who alone imputes to the Mengrelians the interment of their children alive, through wantonness, is not an author of sufficient credit to be quoted.

Chardin, who passes for a traveler of veracity, and who was ransomed in Mengrelia, would have spoken of this horrible custom if it had existed; and his affirming it would not have been sufficient to give it credit. Twenty travelers of different nations and religions should agree to confirm such a strange custom, in order to obtain an historical certainty of it.

It is the same with the women of the Antilles Islands, who raised their children to eat them. This is not the nature of a mother. The human heart is not thus framed.

Amongst the wealthy and the great, who were perverted by the excesses of luxury and jealousy, the refinement was practiced of having eunuchs to wait upon and guard their

wives and concubines. Eunuchs were also in demand in Italy, and were employed at the Pope's Chapel, in order to have voices finer than those of women.

Locke's assertions regarding the saints of the Mahometan religion and their useful quadrupeds, should be placed with prince Maurice's story of the parrot, who kept up such a fine conversation in the Brazilian language, which Locke is simple enough to relate, without considering that the prince's interpreter may have related a joke to him.

In this manner the author of the *Spirit of Laws* amuses himself in quoting the imaginary laws of Tonquin, Bantam, Borneo, and Formosa, upon the report of some travelers, or romancers, or persons misinformed.

Locke and Montesquieu are two great men, in whom such simplicity appears to me inexcusable.

XXXVI. NATURE EVERYWHERE THE SAME.

In giving up Locke at this point, I say with the great Newton, *Natura est semper sibi consona*, Nature everywhere resembles herself. The law of gravitation, which acts upon a star, acts upon all stars, upon all matter. Thus the fundamental law of morality equally acts upon all civilized nations. There are a thousand differences in the interpretation of this law in a thousand circumstances; but the basis ever remains the same, and this basis is the

idea of justice and injustice. Innumerable acts of injustice are committed in the fury of passion, as reason is lost in drunkenness; but when the intoxication is over, reason returns; and this, in my opinion, is the only cause of human society subsisting,—a cause subordinate to the wants of each other's assistance.

How then have we acquired the idea of justice? As we acquired that of prudence, of truth, of conveniences, by sentiment and reason. It is impossible for us to avoid thinking it a very imprudent action for a man to throw himself into the fire, in order to be admired, and who should hope afterwards to escape injury. It is impossible for us to avoid thinking a man very unjust for killing another in his passion. Society is founded entirely upon these notions, which can never be torn from the heart, and it is for this reason that all society subsists, whatever extravagant and horrible superstition it may be subject to.

At what age are we acquainted with what is just and unjust? At the age when we know that two and two make four.

XXXVII. OF HOBBS.

Thou profound and extravagant philosopher, thou good citizen, thou enemy of Descartes, who deceivedst thyself like him, thou whose physical errors are great but pardonable, because thou camest before Newton, thou who hadst told truths that do not obliterate thy mistakes, thou who didst first display the chim

eras of innate ideas, thou who wert the fore-runner of Locke in many things, as well as of Spinoza, in vain dost thou astonish thy readers by almost succeeding to prove to them that there are no laws in the world but the laws of conventions; that there is no justice or injustice but what has been agreed upon as such in a country.

If thou hadst been alone with Cromwell in a desert island, and Cromwell would have killed thee for having been a partisan of thy king in the island of England, would not such an attempt appear to thee as unjust in thy new island as in thine own country?

Thou sayest in thy Law of Nature, "That every one having a right to all things, each has a right over the life of his own likenesses."

Dost thou not confound power with right?

Dost thou think that, in fact, power conveys right? and that a robust son has nothing to reproach himself with for having assassinated his old and decrepid father?

Whoever studies morality should begin by refuting thy book in his heart; but thine own heart refuted it still more; for thou wert virtuous as well as Spinoza,—and thou wert only wanting, like him, in teaching the principles of virtue, which thou didst practice and commend to others.

XXXVIII. UNIVERSAL MORALITY.

Morality appears to me so universal, so calculated by the universal Being that formed

us, so destined to serve as a counterpoise to our fatal passions, and to solace the inevitable troubles of this short life, that from Zoroaster down to Lord Shaftsbury, I find all philosophers teaching the same morality, though they have all different ideas upon the principles of things.

We find that Hobbes, Spinoza, and Bayle himself, who either denied the first principles, or at least doubted of them, have, nevertheless, strongly recommended justice, and all the virtues.

Every nation had peculiar religious rights, and very often absurd and revolting opinions in metaphysics and theology. But the point in question is to know whether we should be just. In this the whole universe agrees, as we said in No. XXXVI., and this statement cannot be too often repeated.

XXXIX. ZOROASTER.

I shall not examine at what time Zoroaster lived, whom the Persians allowed to have existed nine thousand years before them, as well as Plato and the ancient Athenians.

I find that his moral precepts, which were translated from the ancient language of the Magi into the vulgar language of the Guebrians, have been preserved till the present time; and it evidently appears, from the puerile allegories, the ridiculous observations, the fantastic ideas with which this collection is

filled, that the religion of Zoroaster is of the highest antiquity.

The word Garden is there used to express the recompence of the just; we there meet with the evil principle under the word Satan, which the Jews also adopted. We there find the world formed in six times or seasons. It is there commanded to recite an *abunavar* and an *ashim vuhu*, for those who sneeze.

But, in fine, in this collection of a hundred subjects or precepts taken from the book of *Zend*, and which the very words of the ancient Zoroaster are repeated, what moral duties are prescribed?

That of loving and succoring one's father and mother, that of giving alms to the poor, that of never breaking one's word, that of abstaining when doubtful whether the action to be performed is just or not. (Subject XXX)

I shall confine myself to this precept, because no legislator could ever go beyond it; and I am confirmed in the opinion that though Zoroaster established ridiculous superstitions in matters of doctrine, the purity of his morals proves that he was not corrupt, and that the more he gave way to errors in his dogmas, the more impossible was it for him to err in teaching virtue.

SANSKRIT PROVERBS.

The blackness cannot be removed
from charcoal by a hundred washings.

The stone is worn away at last.

Is a lamp pleasing to the blind, a song
to the deaf, or science to the fool?

With fire, fire is kindled.

Excess is to be avoided in all things.
Excessive friendship (causes) doubt
of sin.

Too great exaltation is the cause of a
downfall.

In the country where no tree is seen,
even the castor oil plant is called a tree.

Servitude is the lowest occupation.

More is the fruit of much.

By performing the obsequies of an unclaimed corpse, the reward of ten million sacrifices will be obtained.

The destitute has God for his protector.

Of all the senses, sight is the chief.

Whether he have talent or be without it, a companion is an additional strength; if deprived of husk the rice will not sprout.

After happiness, sorrow; after sorrow, happiness; happiness and sorrow revolve like a disc.

In a strong position, even a coward is a lion.

Where there is friendship, the friend is never far off.

Hard working men in their own business, but rogues in their master's business.

A wise man gains his object; in failure is foolishness.

A fool is honored in his own house; a proprietor is honored in his own village; a king is honored in his own country; a learned man is honored everywhere.

Having crossed yourself, get others across.

What is an excessive burden for the powerful? What is distant for the enterprising? What is foreign to the educated? Who is a stranger to those who speak kindly?

Dismay, the obstacle to all enterprises, is by all means to be eschewed; therefore, having discarded dismay, success in what is to be accomplished is attained.

An unguarded object remains safe, if protected by destiny; stricken by destiny it perishes though well guarded. One lives, though abandoned in a wood without a protector; one lives not in a house, though precaution be taken.

As much as independence extends so far is birth profitable; if those who are in subjection to others live, who are dead?

He stoops for the sake of rising; for the sake of living he resigns his breath; he becomes miserable for the sake of pleasure. Who is a greater fool than a servant?

A man by his own acts goes down and down, or moves upwards, as the digger of a well, or the builder of a wall.

Is there anything naturally beautiful or not beautiful? Whatever is pleasing to anyone, that is beautiful for him.

Inactivity, from fear of committing a fault, is the mark of a coward. O brother, by whom is food renounced for fear of indigestion?

A thing, though made for one purpose, may also serve for another.

Gourds sink in water, but stones float!

A wet garment collects the dust brought to it from every side by the wind.

The thing wished for is of more importance than the wish.

On seeing one thing we are reminded of others connected with it.

Action may vary, but substance cannot.

It is not likely that a man who could flee on his feet would crawl on his knees.

Not even a hundred injunctions could move a man to action as readily as the desire for gain.

It is not the fault of the post that a blind man cannot see it.

A fool's refuge is a fool.

One lump of clay (is moulded) into vessels of many forms, one lump of gold (is made) into ornaments of many shapes; (all) cow-milk is one though yielded by many cows; so the one Supreme soul resides in many bodies.

Silence is half consent.

Through silence there is no quarrel, through vigilance there is no fear.

Where smoke, there fire.

As the seed, so the sprout.

If a man's heart be impure, all things will appear hostile to him.

What will the *Shastra* do for him who has no sense of his own? What will a mirror do for him who has lost his eyes?

He (truly) lives by whom many live.

In every country, that custom prevails which has come down from generation to generation.

As is the perception, so is the fulfilment.

He who flees from an ill-governed town will live.

Even the favor of a man of ill-regulated mind is to be dreaded.

A discontented Brahman is lost (to the world) like a contented king.

If bad men become charitable, it will be a cause of grief to the good.

An evil word from a cousin is insufferable.

Non-injury is the highest religion.

The form is small, the qualities are great.

The observance of ordinances is the first duty.

When the goddess of wealth came, it was like the water in a coconut; when she departed it was like the wood-apple eaten by an elephant.

They know not their own defects who search for the defects of others.

He who looks upon all living beings as upon himself, sees.

The heart of the wise is soft as a lotus flower in prosperity, but in adversity it is as firm as a mountain rock.

Trees loaded with fruit are bent down; the clouds when charged with fresh rain hang down near the earth: even so good men are not uplifted through prosperity. Such is the natural character of the liberal.

A ball, though it fall to the ground, flies up again by the strokes of the hand. Even so the misfortunes of good men are not often lasting.

The tree that is cut down grows again; the moon that wanes after a time waxes again. Thus do wise men reflect and, though distressed, are not overwhelmed.

It is not the fault of the spring that the leafless tree does not produce leaves; it is not the fault of the sun that the owl cannot see by day; it is not the fault of the raincloud that the drops do not fall into the cuckoo's mouth. Who shall reverse that which fate has written on the forehead of each?

The constant man loses not his virtue in misfortune. A torch may point towards the ground, but its flame will still point upwards.

The wise must be respected, even when the advice they give us is not suitable.

Want of practice (makes) science poison, indigestion (makes) food poison.

Those without a leader perish; those with a youthful leader perish; those with a female leader perish; those with many leaders perish.

When the mind is grieved and unconsoled, all is disgust.

Bodies are transitory, riches are not lasting; death is always at hand; (therefore) virtue should be practiced.

The strength of men is rooted in food.

The body, form and sense depend upon the food.

A plan considered (by man) in one way is considered by God in another.

Although unasked, you should speak auspiciously.

Learning depends on practice, intellect on former deeds; wealth follows exertion, and success, good fortune.

This pomp is for the protection of the clout.

A stick has ten uses.

Where frogs are the croakers, there
silence is becoming.

Liberality, sweetness of speech, cour-
age, judgment, these four natural quali-
ties are not attained by practice.

The defect of poverty is the destroyer
of a host of virtues.

Complaisance empties the purse.

Though he be adorned with learning,
a bad man is to be shunned; is a snake
adorned with a gem not to be feared?
(A jewel is said to be found in the head
of a snake.)

The king is the strength of the weak,
crying is the strength of children.

A wicked wife, a false friend, a serv-
ant with pride and living in a house
with a snake are (causes of) death,
without doubt.

Mountains-are beautiful at a distance,
rugged when near.

A foul-mouthed man, a man without
employment, a low fellow, a revengeful
man—these four are base from their
evil deeds; the base-born are better.

The foot should be placed (on a spot)
seen to be clean, water should be drunk
after having been strained through a
cloth; a word should be spoken with
truth, (a business) should be done with
consideration.

The way of justice is mysterious.

Courage is in all things a means (of
success).

It is not a house they call the house,
but the housewife.

No relative is equal to learning; no
enemy is equal to disease; no affection
is equal to that for a child; there is no
power greater than that of Fate.

Better is the edge of a sword, or to live under a tree—better is it to beg, to starve, or even to fall into the dreadful hell, than to depend on a purse-proud relation.

Even if the sun should rise in the west, even if the lotus should bloom on the peaks of the mountains, even if Meru should shake, even if fire should feel cold—the words of the good will surely never fail.

The ocean is the course of rivers.

A greater gift than that of food, has not been and will not be; by food this whole world, animate and inanimate, is sustained.

To quarrel with a man of good speech is better than to converse with a man of rude address.

Man is the slave of money.

Wealth stops at the house, friends and relatives at the grave; good deeds and evil deeds follow the dying man.

Those eager to amass wealth regard neither priests nor relations; those eager to indulge lust feel neither fear nor shame; those eager in the pursuit of knowledge care not for comfort or sleep; those eager to satisfy hunger regard neither the flavor nor the cookery.

There is pain in acquiring wealth, pain in preserving what has been acquired, pain in its loss, and pain in expenditure—why have such a receptacle of sorrow?

Little learning, much pride.

A small beginning is good.

(The reward) of deeds done, be they good or evil, will assuredly be received.

There is no doing of a thing done; there is no death for a dead man; there is no (advantage in) grief for that which is passed—this is the opinion of the learned in Vedas.

The voice is the beauty of cuckoos; chastity is the beauty of women; learning is the beauty of the deformed; patience is the beauty of ascetics.

Anger is a cause of sin.

Success in an undertaking rests in the strength of the great man, not in the means.

The serpent is cruel; a wicked man is cruel; a wicked man is more cruel:—a serpent yields to spells and medicines, but by what can a wicked man be checked?

For the wicked and the evil, the remedy is of two kinds:—either to disgrace them by strategy, or to leave them at a distance.

Repairing the tank-bung after the water has escaped!

An appreciator of good qualities is pleased with a good man, but no pleasure (is experienced) by the bad man; the bee goes from the forest to the lotus, but not so the frog, though he lives with it.

Loss of intelligence is not to be apprehended in one of resolute habits, although ill-treated. A flame of fire though reversed never goes downward.

If a jewel worth placing in a golden ornament is set in lead, it neither tinkles nor shines.

By wise people an appropriate observation is accepted even from a child. On the invisibility of the sun, is not the light of a lamp availed of?

The tempest does not uproot tender grasses, which bend quite low. It throws down, indeed, lofty trees. The great expend valor only on the great.

A king should not tolerate even his children breaking his commands; else what difference is there between a king and the picture of a king.

From thieves, from officials, from enemies, from the king's favorite, and from his own avarice, a king should protect his subjects, like a father.

The dexterous make even untruths appear truths; as people skilled in painting can make hollows and eminences on a level surface.

In case of misfortune, in going on a wrong course, and on the opportunities for efficacious action passing away; a friendly man, even unasked, should utter useful advice.

A man should not enter into alliance with his enemy, even with the tightest bonds of union. Water made ever so hot, will still quench fire.

Birds and beasts unite from motives of convenience; fools from fear and stupidity; and just men at sight.

Although friendship between good men be interrupted, still their principles remain unaltered. The stalk of the lotus may be broken, and the fibres remain connected.

A man should abandon that country, wherein there is neither respect, nor employment, nor connections, nor the advancement of science.

Whether a child, or an old man, or a youth, come to thy house, he is to be treated with respect; for of all men, thy guest is the superior.

A pleasant countenance, and a mien without pride; great attention to what is said, and sweetness of speech; a great degree of kindness, and the appearance of awe; are always tokens of a man's attachment.

A man of nice feelings willingly encountereth death, rather than submit to poverty. A fire meeteth extinction, before it will yield to be cold.

Thou seest the fire burning on the mountain, but not that which is under thy very feet!

Poisoned wounds will not heal without the use of the lancet.

Not even by the most thorough examination, could one distinguish between black and white, in intense darkness.

He who performs an action will himself reap the fruit thereof.

When brothers divide wealth they themselves become divided.

The meaning of an ambiguous expression is to be determined from the context.

If a man with eyes is led by somebody else, it is clear that he does not see with his eyes!

Here is another boil on the top of a previous one!

On one side a tiger, on the other a precipice!

Like salt on a wound.

The very same face which looks large in a large mirror, appears small in the pupil of the eye.

The virtuous man appreciates virtue, the bad man appreciates it not; the strong man, and not the feeble, understands strength; the cuckoo, and not the crow, feels the influence of the spring; the elephant, and not the mouse, justly values the strength of the lion.

You should practice virtue as if death had seized you by the hair.

Sorrow is the fever of men.

By slitting the ears and cutting the tail, a dog is but a dog—not a horse, not an ass.

One should act according to the people's voice.

To him who is born, death is certain.

A son-in-law is the tenth planet. (A troublesome fellow.)

You may kill him who wishes to kill you.

You may kill a man on the field of battle who attempts to kill you though he be learned in the Vedanta; you will not by that become a Brahman-slayer.

The commentary requires a commentary.

He is wise whose wrath is limited by his power.

Life goes day by day.

By delay (in using it) nectar becomes poison.

Desire upon desire (causes) the greatest sorrow; contentment, the greatest happiness.

In eating and in business he who discards modesty will be best off.

Food is provided with the birth of men.

The Lord's creation is His mere will.

In a good man, wrath (lasts) for a moment; in a middling man, for two hours; in a base man, for a day and night; in a great sinner, until death.

After the stream has been crossed
what is the use of the boat on the other
side?

The forsaking of one who has gone
out of the right way is enjoined.

The desires of the poor spring up and
perish.

Perseverance, daring, courage, wis-
dom, strength and valor—where these
six are, there is God.

Superiority is not in seniority; su-
periority is attributed to virtue.

After a fever, a purge.

Wives can be procured in all coun-
tries, and relatives as well, but I see not
a country where there is a brother born
of the same womb.

Death is the punishment of a robber; the punishment of a harlot is shaving the head; the punishment of a friend is not speaking to him.

A fool looks well at a distance with his flowing garments; a fool shines so long as he says nothing.

Cotton is lighter than grass and a beggar is lighter (more insignificant) than cotton—why is he not carried away by the wind? “Lest he should beg of me” (fears the wind).

Who has reached the limit of desire.

You should forsake a man for the sake of your family; you should forsake your family for the sake of your village; you should forsake your village for the sake of your country; you should forsake the earth for the sake of yourself.

It is better to wander in a mountain-pass with the wild beasts than to live in the palace of the gods with a fool.

Perceiving the transitory world to be like a mirage, one should associate with the good for the sake of virtue, and for the sake of happiness.

The man who is entirely ignorant is easily guided: the wise man is still more easily led: but even the Supreme Being himself cannot influence the smatterer.

There are two uses both for a garland of flowers and also for a wise man—they may be exalted on the head or wither in the forest.

The lion, though young, attacks the elephant infuriated with passion. The energy of the noble-minded man proceeds from his natural disposition, not from his youth.

Giving, consuming, and loss, are the three ways by which wealth is diminished. The man who neither gives nor spends has yet the third way open to him.

A king full of wrath hath no friend.
The sacred fire burns even the priest
who offers the sacrifice if he touches it.

Deer, fish and virtuous men, who only
require grass, water and peace in the
world, and wantonly pursued by hunts-
men, fishermen and envious people.

The king who makes prosperity de-
pendent on a minister, on the happen-
ing of calamity sinks, like the blind
without guides.

Although committing faults, he who
is beloved is indeed beloved; to whom is
the body not dear, although defiled by
endless imperfections?

A bad person reverts to his natural
character even while being assiduously
well treated: as a dog's tail, with all
expedients of warming and anointing,
remains bent.

How can the promotion and honour of the vile conduce to conciliation? Poison-trees, though watered with nectar, do not bear wholesome fruits.

Any bad person acquires lustre from the beauty of his patron; like smutty collyrium applied to the eye of a lovely woman.

In sandal trees there are serpents. In the waters with lotuses there are also alligators. There are no unobstructed pleasures.

When in peace he should perceive nothing beneficial to himself; then the wise man dies combating with the enemy.

Knowledge is the most precious treasure of all things, because it can never be given away, nor stolen, nor consumed.

A good man may fall, but he falls as a ball; an ignoble man falls like a lump of clay.

Learning to the inexperienced is a poison; eating upon a full stomach is a poison; the society of the vulgar is a poison.

A fool too may shine in the assembly, dressed in fine garments; he shineth no longer, however, than he holdeth his tongue.

If, by the decree of fate, the world were ever to become deprived of lotuses, would the swan scratch at the dust-heap like the cock?

A thing done at a wrong time would be regarded as not done.

The tip of a finger cannot be touched by itself.

From seeing smoke rising from one house we do not infer that there is a fire in another house.

Fruitful trees bend down, men of wisdom stoop;—a dry stick and a fool can be broken but not bent.

No pleasure is obtained without pain.

There is no greater sin than a lie.

A husband is the ornament of women.

There is no village—how can there be a boundary?

There is no learning—how can there be fame?

There is no wisdom—how can there be salvation?

There is no faith—how can there be understanding?

What is the use of oil to an extinguished lamp? What is the use of care after the thief has gone?

A mean fellow promises and does not; a good man promises not, but does.

Wood is beautified by chiseling; copper is polished by tamarind; the road is cleansed by the wind!

The rivers themselves drink not (their) water, nor do the trees eat (their own) sweet fruit; the clouds eat not the crops—the riches of the good are (employed) for the benefit of others.

Proficiency in advising others is easy to all men; few are the great men who themselves practice virtue.

One interested in our welfare is a relative, though a stranger; one injurious is a stranger, though a relative; disease is hurtful, though born in our body; medicine is beneficial though produced in a forest.

Sorrow for (the loss of) a father (lasts) six months; sorrow for a mother, a year; sorrow for a wife until a second wife (comes); sorrow for a son, for ever.

A man of evil repute is, though living, as one dead.

In the absence of men, all women are chaste.

Learning, in the book, is not learning, and money in the hand of another is not money when the time (of need) arises.

Knowledge of the possibility of the act is an inseparable motive to perseverance.

Keeping away from the mire is better than washing it off.

Even at the cost of his life, one should preserve his honor; life is transient, honor is as lasting as the moon and stars.

Union, indeed, proves the possibility of separation; just as birth does the approach of inevitable death.

As one piece of wood and another piece of wood may meet together in the ocean; and, having met, may part again,—such-like is the meeting of human beings.

As the streams of rivers flow on, and return not; so also day and night forever proceed, taking with them the life of mortals.

The soul is a river, whose holy confluence is self-restraint, whose water is truth, whose bank is morality, whose waves are compassion. Here perform ablutions, O son of Pandu! The inward soul is not purified by water.

A king should not make war upon many opponents at once. Even a fierce serpent is infallibly destroyed by swarming insects.

A wicked person is like an earthen pot, easy to break and hard to join together again; but a good person, like a vessel of gold, is hard to sever, but quickly to be united.

For a mind spoiled by the wicked there is no confidence even in the good. Does not a child scalded by porridge eat even curds after they have been blown upon.

The covetous should be won over with money; the haughty, by joining the hands; a fool, by humoring his inclination; a wise man, with truth.

A crane's meditation! (Cranes appear to be meditating when they are ready to pounce on the fish.)

A drop is as the ocean (to the good) . the ocean is as a single drop (to the base).

O friend! the serpent only knows the serpent's feet.

The cuckoo feels no pride in the possession of a delicious mango; a frog is set a croaking by a gulp of muddy water.

A king perceives by his ears, the learned by their intellect; a beast perceives by scent, and fools by the past.

Even a single lion tears to pieces a herd of mad elephants.

The mind of men is the cause of bondage and release.

Enmities end with death.

Flesh is increased by flesh.

It is possible to stop fire with water, rain and heat with an umbrella, an elephant with a sharp hook, a bull or ass with a stick, a disease with medicines, and venom by the use of various spells; for everything there is a remedy provided in the *Shatres*—but there is no cure for the headstrong.

A reasonable word should be received even from a child or a parrot.

The peacock is in the mountain and the clouds in the sky; at the distance of a hundred thousand *vojanas* is the sun, and the lotus is in the water; two hundred thousand *vojanas* away is the moon from its friend, the lily—what is dear to one's heart is not far off.

A son should be treated as a prince for five years, as a servant for ten years and, from his sixteenth year on, as a friend.

The king must answer for his country's sin; the priest for the king's sin; the husband for the wife's sin, and the *Guru* for the disciple's sin.

Fasting is the best medicine.

Modesty is the ornament of women.

The spring is the youth of trees, wealth is the youth of men, beauty is the youth of women, intelligence is the youth of the young.

Better that a man's learning should die with him than that it should be thrown away on the foolish.

The gem of learning is great wealth, it cannot be shared by cousins, nor lost by robbery, nor exhausted by liberality.

A sick man is the best subject for a physician, and an active emissary for the officers of government; fools are the support of the learned, and a man of secrecy suits a king.

A wise man may strive to conquer, but he should never fight; because victory, it is observed, cannot be constant to both the combatants.

One who is master of ever so little art may be able, on a great occasion, to root up trees with as much ease as the current of a river the reeds and grass.

A store of grain, O king! is the best of stores. A gem cast into the mouth will not support life.

A patient will never recover his health merely from the description of a medicine.

An enemy's army which has been harassed for a long time, may be easily defeated.

The alligator, matchless as he is, when he quitteth the water is without power. Were even the lion to forsake the forests, he would doubtless be upon a level with the jackal.

An alliance may be formed with an assisting enemy, but not with an injuring friend. Helping and injuring is alone worthy to be regarded as the distinguishing characteristics of these two.

How can there be the displacing of one who is already invested with authority? Favor conferred on the low, O king! is like an impression on the sands

Forbearance towards both an enemy and a friend is, of a truth, the ornament of ascetics; but towards offending beings it is, verily, for kings, a defect.

As long as a danger is not arrived, so long there should be apprehension about it; perceiving the danger arrived, one should attack it fearlessly.

One not in his own place is destroyed by even an insignificant enemy; an alligator, though very small in water, drags in even an elephant.

Neither gift of land, nor gift of gold, nor gift of cattle, nor gift of food, is as the gift of security from danger.

Day by day Death approaches nearer the vicinity of a living creature; just as slaughter to a victim being led along step by step.

What benefit is there in a son who is neither learned nor virtuous? Of what use is a sightless eye?

One child of genius is a blessing; not so even a hundred fools. A single moon dispelleth darkness better than a host of stars.

Fortune attendeth that lion amongst men who exerteth himself. They are weak men who declare fate the sole cause.

As the chariot will not move upon a single wheel, even so fate succeedeth not without human exertion.

As the potter formeth the lump of clay into whatever shape he liketh, even so may a man regulate his own actions.

As a piece of glass, from the vicinity of gold, acquireth the color of a topaz; so a fool may derive some consequence from the presence of a wise man.

In a noble race, levity without virtue is seldom found. In a mine of rubies, when shall we find pieces of glass?

No man beholdeth prosperity who doth not encounter danger; but having encountered danger, if he surviveth, he beholdeth it.

Learning is honored by kings, not wealth; one void of learning is a beast.

The learned only know the labor of the learned, the barren woman knows not the great pains of childbirth.

In the time of calamity, the sense is perverted.

Fortitude in misfortune, forbearance in prosperity, eloquence in the assembly, valor in battle, eagerness in (seeking) fame, attention in the *Vedas*—these are natural to a great man.

Silence is the ornament of the ignorant.

It is not right for one to cut down even a poisonous tree which he himself has reared.

Poison is the remedy for poison.

Nectar should be taken out of poison ;
a well-spoken word should be received
even from a youth ; rectitude should be
acknowledged even in an enemy ; and
gold should be taken even out of filth.

Proclaiming the name of a son before
he is born. (Counting your chickens
before they are hatched.)

Better a doubtful condition of things
than a crushing defeat.

One who leans on a blind man will
fall with him at every step.

Crying in wilderness. (Wasted ef-
fort.)

Failing to obtain a lovely woman, af-
fection is shown towards animals.

He who has the want, the power and
the wit, has the right.

That which at the beginning and at the end has no (real) existence has none either during the intervening period.

It is unwise to quarrel with that on which one's livelihood depends.

Bare assertion is no proof of the matter asserted.

Whilst avoiding one kind of fallacy, another kind appears.

Behold the difference between the one who eateth flesh, and he to whom it belonged! The first hath a momentary enjoyment, whilst the latter is deprived of existence!

There is no one the friend of another; there is no one the enemy of another: friends, as well as enemies, are created through our transactions.

A friend may be known in adversity, a hero in battle, an honest man in a loan, a wife when riches are spent, and a relation in trouble.

A man should forsake such a friend as speaketh kindly to his face, and behind his back defeateth his designs. He is like a pot of poison with a surface of milk.

A man should not form any acquaintance, nor enter into any amusements, with one of an evil character. A piece of charcoal, if it be hot, burneth; and if cold, it blackeneth the hand.

Even amongst brutes, confidence is perceived in those in whose every action there is innocence. The innate disposition of the good doth not vary from the principles of integrity.

The mind of a good man doth not alter, even when he is in distress.

The poison of a scorpion is in his tail; the poison of a fly is in his head; the poison of a serpent is in his fang; the poison of a bad man is in his whole body.

Useless is rain to the sea, and useless is food to one satisfied; useless is a gift to a rich man, useless is youth to a poor man.

In a fight between bulls, the calf's leg is broken.

Leave off a hundred (works) and eat. In a hundred, one hero is found; in a thousand, one *Pandit*.

The body is the abode of diseases.

Moral rectitude is everywhere an ornament.

Do today what must be done tomorrow.

Of the six flavors, salt is the chief.

Good men are energetic in seeking the good of others.

Food should be eaten with affection.

Vice and virtue spring from association.

In the world's ocean is grief.

The good are always ready to be the upholders of the good in their misfortunes. Elephants even are wont to bear the burthens of elephants who have sunk in the mire.

As often as thou shalt be deprived of the society of the good, so often shalt thou fall into the company of knaves.

A friend, who is so by nature, is the gift of Providence. Such unfeigned friendship is not extinguished, even in misfortunes.

A man who, having well compared his own strength or weakness with that of others and after all doth not know the difference, is easily overcome by his enemies.

Friends, tainted with the lust of gain, are everywhere to be found in times of prosperity; and adversity is their touchstone.

He who forsakes a certainty, and depends on an uncertainty loses both the certainty and the uncertainty together.

Those who are aware of it can interpret the mind from the changes of the eyes and other members; and even by the report of shape and complexion.

The moon is the light of the night, the sun is the light of the day; virtue is the light of the three worlds; a good son is the light of the family.

Say, what does not good association do for men? It removes the dullness of their intellects; it sprinkles truth in their speech; it gains the highest honors for them; expels sin from them; it purifies their mind, and spreads their fame towards all quarters.

Speak the truth, and speak to please;
 speak not the truth, to displease; speak
 not untruth, to please; this is eternal
 virtue.

A friend can be gained by transparency (of conduct); an enemy, by prudence and power; a miser, by money; a master, by service; a Brahman, by kindness; a young wife, by tenderness; relatives, by patience; a passionate man, by praise; a priest, by reverence; a fool, by stories; a wise man, by learning; a man with a taste, by humoring him; and all, by good conduct.

The effect of music is but immediate.

If there be great learning, what of money? If there be an ill name, what of death?

A thief's offer of his limbs for examination when the gold has been found under his armpit!

A hyena does not find a suitable opponent in a young fawn.

Who befriends, he is a relation; who supports, he is a father; he is a friend, in whom there is confidence; she is a wife, in whom there is pleasure.

A lamp will not throw light on an object before it is (lighted and) brought in.

Anything that has been made is not eternal.

He who causes a thing to be done is the real doer of it.

Running away through fear of a scorpion, he falls into the jaws of a poisonous snake! (From the frying pan into the fire.)

The snake stupified by its own poison bites its own body.

When the loss of all is impending, a wise man will give up half.

All hath been read, all hath been heard, and all hath been followed by him, who having put his hope behind him, dependeth not upon expectation.

Giving with kind words, knowledge without pride, heroism accompanied by clemency, and wealth with liberality, are four excellences hard to be found.

Men of philosophic minds do not long for what is not attainable, and are not willing to lament what is lost; neither are they wont to be embarrassed in times of calamity.

As frogs to the pool, as birds to a lake full of water; so doth every species of wealth necessarily flow to the hands of him who exerteth himself.

For the belly's sake many disguises are assumed.

Men who are acquainted with their own nature pass their days, until the period of death, in gladness.

Man should not be over anxious for a subsistence, for it is provided by the Creator. The infant no sooner droppeth from the womb, than the breasts of the mother begin to stream.

He, by whom the geese were formed white, parrots were stained green, and peacocks painted of various hues—even He will provide for their support.

Endeavor makes the man.

Fortune favors the persevering and stout-hearted.

By doing good to base men, evil results; the drinking of milk is to snakes only an increasing of poison.

That which is possible by stratagem is not possible by valor.

In hot weather, (people say) "Let there be cold"; in cold weather, "Let there be great heat."

Debt, a sore and a stain will be effaced in time.

One commits sin, many persons suffer the consequences.

A chariot will not go on one wheel.

The flowers of the fig tree, a white colored crow, a fish's foot in the water, one may see—but not what is in a woman's mind.

Whom on earth will a handsome woman not subdue?

Concealment itself reveals the wishes.

Barren as a plantain, barren as a crow.

The crow is black, the cuckoo is black; there is no difference between the cuckoo and the crow: but as spring nights appear, the crow is a crow, the cuckoo a cuckoo.

Day and night, evening and morning, winter and spring, come again and again; time sports, life goes, but nevertheless the chain of desire loosens not.

The ways of time are capricious.

He (truly) lives, who has acquired fame.

As a family (is ruined) by a bad son.

The production of a flower in a flower, has never been heard of, nor seen.

A miser's wealth goes by fire, robbers, and kings.

To those who are fallen into misfortunes, what was a blessing becometh an evil: to a child in confinement, its mother's knee is a binding post.

Fortitude in adversity, and moderation in prosperity; eloquence in the senate, and courage in the field; great glory in renown, and labor in study; are the natural perfections of great minds.

A combination even of small things serveth an occasion. A mad elephant may be bound with a few straws, when formed into a rope.

Men are the same as other animals, in eating, sleeping, fearing and propagation. Reason, alone, is man's superior distinction. Deprived of reason, he is upon an equality with the brutes.

Like milk and water. (Close friendship.)

Hospitality is commanded to be exercised, even towards an enemy, when he cometh to thine house. The tree does not withdraw its shade, even from the wood-cutter.

Fire burns forests and wind is a friend (assists); but that very wind proves destructive to the lamp. Who is honored when reduced (in circumstances).

Other Titles in Pocket Series

Drama

- 295 Master Builder. Ibsen.
 90 Mikado. Gilbert.
 31 Pelleas and Melisande
 Maeterlinck.
 316 Prometheus. Aeschylus.

LIFE AND LETTERS

LIFE AND LETTERS is a monthly magazine, edited by E. Haldeman-Julius. LIFE AND LETTERS presents creative thought to you in a simple, compact, inexpensive form. It takes one great personality each month—such as Plato, Goethe, Shakespeare, Nietzsche, Thoreau, Darwin—and gives a comprehensive report of the man's life and achievements. The dominating essay is usually about 15,000 words long. One year—twelve issues—only \$1 in U. S., \$1.50 in Canada and Foreign. LIFE AND LETTERS, GIRARD, KANSAS.

HALDEMAN-JULIUS WEEKLY

HALDEMAN-JULIUS WEEKLY, edited by E. Haldeman-Julius, aims to bring before its readers concise reports of the world's achievements in science, literature, art, drama, politics and every other field of human endeavor. The HALDEMAN-JULIUS WEEKLY brings to its readers the best works of the world's greatest minds. Fifty-two issues—one year—only \$1 in U. S.; \$1.50 in Canada and Foreign. HALDEMAN-JULIUS WEEKLY, GIRARD, KANSAS.

KNOW THYSELF

KNOW THYSELF is a monthly magazine edited by William J. Fielding and E. Haldeman-Julius. KNOW THYSELF'S policy is to supply information along the lines of psychoanalysis, sex, science, etc. It is a valuable source of information. One year—twelve issues—\$1.50 in U. S.; \$2 in Canada and Foreign. KNOW THYSELF, Girard, Kansas.

INTRODUCTION

Henry Edward Manning (1808-1892) was born in Hertfordshire (England) on July 15, 1808. His father was a merchant, banker, and member of Parliament. He was educated at Harrow (1822-1827); and at Balliol College, Oxford, from which he graduated with honors in 1830. Two years as a clerk in a colonial office found him looking to a religious career, so he returned to Oxford, was elected a fellow of Merton College, was ordained. In 1833 he received a rectory, and on November 7, 1833, he married Caroline Sargent. His young wife was consumptive, and died childless on July 24, 1837.

Saddened by his bereavement, Manning turned seriously to the teachings of the Oxford Tracts (the so-called "Oxford movement," attempting to prove the Catholicity of the Church of England; resulting in the restoration of ceremonial observances and intensifying the symbolism of ritual; strengthened the claim of the Anglican Church to be considered a branch of the Church Catholic). In 1838, Manning first went to Rome, where, in company with W. E. Gladstone (1809-1898; four times Prime Minister of England), he visited Dr. Wiseman (1802-1865; English cardinal). In 1841, Manning was appointed archdeacon. In 1842 he published a treatise entitled *The Unity of the Church*, which confirmed his reputation as an eloquent and sincere preacher, and led to his being called upon occasionally to fill

the pulpit that John Henry Newman (1801-1890; cardinal and author, leader of the Tractarian movement; became a Catholic in 1845) was beginning to give up. Between 1842 and 1850 four volumes of Manning's sermons were published, which ran into several editions. Manning was still loyal to Protestantism, and Newman's desertion in 1845 left Manning in a responsible position among the High Church leaders.

Due to an illness in 1847, Manning went abroad, and was again in Rome. He had private audiences with the pope in 1848, and was already beginning to find attraction in Roman Catholicism. A crisis came in the affairs of the Church of England, due to the appointment to a benefice of a man who disbelieved a standard doctrine, and in 1850 came the popular agitation against "Papal aggression." Manning could not sympathize with this movement, and resigned his benefice and archdeaconry. On April 6, 1851, he was received into the Roman Catholic Church; on the following Sunday he was confirmed and received to communion; and within ten weeks Cardinal Wiseman ordained him priest.

Manning's religious devotion increased, and his growing influence and rise in power were rapid. In 1854 the pope conferred on him the degree of D. D. The pope appointed him provost of Westminster in 1857. Manning became the staunch supporter and assistant of Wiseman. Manning's increasing fervor in promoting in England all that was Roman and papal was very offensive to Catholics of the "old

school," who leaned more toward Gallicanism (independence of the Church from Rome). After delivering lectures in 1860 on the pope's temporal power (shortly to be terminated by the occupation of Rome and the pope's "imprisonment" in the Vatican), Manning was appointed papal domestic prelate ("Right Reverend"). This placed him definitely at the head of Ultramontanism (the movement desiring to see all the power of the Church concentrated in Rome; its principles were made tenets of Roman Catholicism by the Vatican Council of 1869-1870).

Cardinal Wiseman died on February 15, 1865, and Manning's succession to his archbishopric became probable. Considerable effort was made to prevent his appointment, but Pius IX ignored this opposition and Manning was appointed. He was consecrated on June 8, 1865, and was enthroned on November 6th. He became very active in religious education, and sought, in vain, to establish a Catholic university.

At the Vatican Council of 1869-1870, Manning was instrumental in furthering the promulgation of the doctrine of papal infallibility (asserting that the pope, when speaking *ex cathedra*—"from the chair," or throne—on matters of faith or morals, is divinely inspired and is divinely prevented from error). And, on March 15, 1875, Manning was made Cardinal. Present at the death of Pius IX (February 7, 1878), Manning had a fair chance of succeeding him as pope; but he himself supported the nomination of Cardinal Pecci, who became Leo

XIII. Manning now turned his attention to social questions, and, because of his activity along these lines, he has been accused of Socialistic sympathies. Although he did endorse some of the dogmas of Socialism, he was not in any sense a Socialist. His continued efforts on behalf of labor and laborers earned for him a wide popularity; his death, on January 14, 1892, was popularly mourned. The Roman Catholic Cathedral at Westminster is a joint memorial to him and to his predecessor, Cardinal Wiseman.

Critics are agreed that Manning's high devotion and exemplary zeal did much to increase the influence of and respect for Roman Catholicism. His sermons, however, appeal more to the heart than to the mind; he combined the qualities of orator, statesman, diplomat, and even of the business man; but "he was neither a philosopher nor a literary genius."

Robert Green Ingersoll (1833-1899) was born in Dresden, New York, on August 11, 1833. His father was a Congregational minister, transferring to Wisconsin, and from there to Illinois. Ingersoll became a lawyer, was admitted to the bar in 1854, and practiced successfully in Illinois. During the Civil War he led a cavalry regiment, with the rank of colonel; was captured in Tennessee on December 18, 1862. From 1867 to 1869 he was attorney-general of Illinois. His reputation as an orator was established when, at the Republican National Convention of 1876, he spoke for the nomination of James G. Blaine for the presidency.

Ingersoll's fame rests on his numerous lec-

tures (his complete works in twelve volumes were published in 1901), violently attacking established religion and the Bible. His iconoclastic activities destroyed his political chances. He died at Dobbs Ferry, New York, on July 21, 1899.

Ingersoll is represented, in addition to the present volume, in the following Little Blue Books: *Wisdom of Ingersoll* (No. 56); *Vindication of Thomas Paine* (No. 88); *Controversy on Christianity* (with W. E. Gladstone, No. 130); *Lecture on Shakespeare* (No. 160); *Lecture on Lincoln* (No. 213).

The present discussion between Ingersoll and Manning was one conducted by the *North American Review* in 1887 and 1888. In editing the texts of each man I have made every endeavor to be impartial; the fact that Ingersoll is given nearly twice the space that is allotted to Manning is in keeping with the original texts, whose lengths were in about this same proportion.

LLOYD E. SMITH.

ROME OR REASON

THE CHURCH ITS OWN WITNESS

Cardinal Manning

The Vatican Council,¹ in its Decree on Faith, has these words: "The Church itself, by its marvelous propagation, its eminent sanctity, its inexhaustible fruitfulness in all good things, its catholic unity and invincible stability, is a vast and perpetual motive of credibility, and an irrefragable witness of its own Divine legation." Its Divine Founder said: "I am the light of the world"; and, to His Apostles, He said also, "Ye are the light of the world," and of His Church He added, "A city seated on a hill cannot be hid." The Vatican Council says, "The Church is its own witness." My purpose is to draw out this assertion more fully.

These words affirm that the Church is self-evident, as light is to the eye, and through sense, to the intellect. Next to the sun at noonday, there is nothing in the world more manifest than the one visible Universal Church. Both the faith and the infidelity of the world bear witness to it. It is loved and hated, trusted and feared, served and assaulted, honored and blasphemed: it is Christ or Antichrist,

¹Convened in 1869 by Pius IX; the first since the Council of Trent, three hundred years earlier; made famous by its ratification of "papal infallibility."

the Kingdom of God or the imposture of Satan. It pervades the civilized world. No man and no nation can ignore it, none can be indifferent to it. Why is all this? How is its existence to be accounted for?

Let me suppose that I am an unbeliever in Christianity, and that some *friend* should make me promise to examine the evidence to show that Christianity is a Divine revelation; I should then sift and test the evidence as strictly as if it were in a court of law, and in a cause of life and death; my will would be in suspense; it would in no way control the process of my intellect. If it had any inclination from the equilibrium, it would be toward mercy and hope; but this would not add a feather's weight to the evidence, nor sway the intellect a hair's breadth.

After the examination has been completed, and my intellect convinced, the evidence being sufficient to prove that Christianity is a divine revelation, nevertheless, I am not yet a Christian. All this sifting brings me to the conclusion of a chain of reasoning; but I am not yet a believer. The last act of reason has brought me to the brink of the first act of faith. They are generically distinct and separable. The acts of reason are intellectual, and jealous of the interference of the will. The act of faith is an imperative act of the will, founded on and justified by the process and conviction of the intellect. Hitherto I have been a critic: henceforward, if I will, I become a disciple.

It may here be objected that no man can so far suspend the inclination of the will when

the question is, has God indeed spoken to man or no? is the revealed law of purity, generosity, perfection, divine, or only the poetry of imagination? Can a man be indifferent between two such sides of the problem? Will he not desire the higher and better side to be true? and if he desire, will he not incline to the side that he desires to find true? Can a moral being be absolutely indifferent between two such issues? and can two such issues be equally attractive to a moral agent? Can it be indifferent and all the same to us whether God has made Himself and His will known to us or not? Is there no attraction in light, no repulsion in darkness? Does not the intrinsic and eternal distinction of good and evil make itself felt in spite of the will? Are we not responsible to "receive the truth in the love of it?" Nevertheless, evidence has its own limits and quantities, and cannot be made more or less by any act of the will. And yet, what is good or bad, high or mean, lovely or hateful, ennobling or degrading, must attract or repel men as they are better or worse in their moral sense; for an equilibrium between good and evil, to God or to man, is impossible.

The last act of my reason, then, is distinct from my first act of faith precisely in this: so long as I was uncertain I suspended the inclination of my will, as an act of fidelity to conscience and of loyalty to truth; but the process once complete, and the conviction once attained, my will imperatively constrains me to believe, and I become a disciple of a Divine revelation.

My friend next tells me that there are Christian Scriptures, and I go through precisely the same process of critical examination and final conviction, the last act of reasoning preceding, as before, the first act of faith.

He then tells me that there is a Church claiming to be divinely founded, divinely guarded, and divinely guided in its custody of Christianity and of the Christian Scriptures.

Once more I have the same twofold process of reasoning and of believing to go through.

There is, however, this difference in the subject-matter: Christianity is an order of super-natural truth appealing intellectually to my reason; the Christian Scriptures are voiceless, and need a witness. They cannot prove their own mission, much less their own authenticity or inspiration. But the Church is visible to the eye, audible to the ear, self-manifesting and self-asserting: I cannot escape from it. If I go to the east, it is there; if I go to the west, it is there also. If I stay at home, it is before me, seated on the hill; if I turn away from it, I am surrounded by its light. It pursues me and calls to me. I cannot deny its existence; I cannot be indifferent to it; I must either listen to it or wilfully stop my ears; I must heed it or defy it, love it or hate it. But my first attitude toward it is to try it with forensic strictness, neither pronouncing it to be Christ nor Antichrist till I have tested its origin, claim, and character. Let us take down the case in shorthand.

1. It says that it interpenetrates all the nations of the civilized world. In some it holds

the whole nation in its unity, in others it holds fewer; but in all it is present, visible, audible, naturalized, and known as the one Catholic Church, a name that none can appropriate. Though often claimed and controversially assumed, none can retain it; it falls off. The world knows only one Catholic Church, and always restores the name to the right owner.

2. It is not only a national body, but extra-national, accused of its foreign relations and foreign dependence. It is international, and independent in a supernational unity.

3. In faith, divine worship, sacred ceremonial, discipline, government, from the highest to the lowest, it is the same in every place.

4. It speaks all languages in the civilized world.

5. It is obedient to one Head, outside of all nations, except one only; and in that nation, his headship is not national but world-wide.

6. The world-wide sympathy of the Church in all lands with its Head has been manifested in our days, and before our eyes, by a series of public assemblages in Rome,² of which nothing like or second to it can be found. . . . To this, again, must be added the world-wide outcry and protest of all the Catholic unity against

²The Cardinal's figures, summarized, are: 1854, 350 bishops in Rome, definition of Immaculate Conception; 1862, 400 bishops, canonization of Japanese martyrs; 1867, 500 bishops, 18th centenary of St. Peter's martyrdom; 1870, 700 bishops, Vatican Council—during which, on the Feast of the Epiphany, bishops of 30 nations knelt for two hours before the pope.

the seizure and sacrilege of September, 1870, when Rome was taken by the Italian Revolution.³

7. All this came to pass not only by reason of the great love of the Catholic world for Pius IX, but because they revered him as the successor of St. Peter and the Vicar of Jesus Christ. For that undying reason the same events have been reproduced in the time of Leo XIII. In the early months of this year⁴ Rome was once more filled with pilgrims of all nations, coming in thousands as representatives of millions in all nations, to celebrate the sacerdotal jubilee of the Sovereign Pontiff. The courts of the Vatican could not find room for the multitude of gifts and offerings of every kind which were sent from all quarters of the world.

8. These things are here said, not because of any other importance, but because they set forth in the most visible and self-evident way the living unity and the luminous universality of the One Catholic and Roman Church.

9. What has thus far been said is before our eyes at this hour. It is no appeal to history, but to a visible and palpable fact. Men may explain it as they will; deny it, they cannot. They see the Head of the Church year by year speaking to the nations of the world; treating with Empires, Republics and Governments. There is no other man on earth that

³Marking the end of the temporal power of the pope; ever since, the pope has considered himself a prisoner in the Vatican.

⁴1887.

can so bear himself. Neither from Canterbury nor from Constantinople can such a voice go forth to which rulers and people listen.

This is the century of revolutions.⁵ Rome has in our time been besieged three times; three Popes have been driven out of it, two have been shut up in the Vatican.⁶ The city is now full of the Revolution. The whole Church has been tormented by Falk laws,⁷ Mancini laws,⁸ and Crispi laws.⁹ An unbeliever in Germany said some years ago, "The net is now drawn so tight about the Church, that if it escapes this time I will believe in it." Whether he believes, or is even alive now to believe, I cannot say.

Nothing thus far has been said as proof. The visible, palpable facts, which are at this moment before the eyes of all men, speak for themselves. There is one, and only one, world-wide unity of which these things can be said.

⁵As witness: Mexico, 1821, independence from Spain; 1821-29, Greek War for Independence; 1822, in Portugal; 1830, in France; 1848, throughout Europe; 1857, mutiny in India; 1861-65, American Civil War.

⁶Pius IX and Leo XIII, "prisoners" by their own choice, under their oath never to submit to the Italian Government's domination of Rome.

⁷Paul Ludwig Falk (1827-1900), German statesman, caused enactment of "Falk laws" for repression of Roman Catholic clergy.

⁸Pasquale Stanislao Mancini (1817-1888), Italian jurist and statesman, active against religious interests.

⁹Francesco Crispi (1819-1901), Italian military dictator.

It is a fact and a phenomenon for which an intelligible account must be rendered. If it be only a human system built up by the intellect, will and energy of men, let the adversaries prove it. The burden is upon them; and they will have more to do as we go on.

Thus far we have rested upon the evidence of sense and fact. We must now go on to history and reason.

Every religion and every religious body known to history has varied from itself and broken up. Brahminism has given birth to Buddhism¹⁰; Mahometanism¹¹ is parted into the Arabian and European Khalifates; the Greek schism into the Russian, Constantinopolitan, and Bulgarian antocephalous fragment; Protestantism into its multitudinous diversities. All have departed from their original type, and all are continually developing new and irreconcilable, intellectual and ritualistic, diversities and repulsions. How is it that, with all diversities of languages, civilization, race, interest, and conditions, social and political, including persecution and warfare, the Catholic nations are at this day, even when in warfare, in unchanged unity of faith, communion, worship and spiritual sympathy with each other and with their Head? This needs a rational explanation.

It may be said in answer, endless divisions

¹⁰Essence of Buddhism, Little Blue Book No. 325.

¹¹Essence of the Koran, Little Blue Book No. 428.

have come out of the Church, from Arius¹² to Photius,¹³ and from Photius to Luther.¹⁴

Yes, but they all came out. There is the difference. They did not remain in the Church, corrupting the faith. They came out, and ceased to belong to the Catholic unity, as a branch broken from a tree ceases to belong to the tree. But the identity of the tree remains the same. A branch is not a tree, nor a tree a branch. A tree may lose its branches, but it rests upon its root, and renews its loss. Not so the religions, so to call them, that have broken away from unity. Not one has retained its members or its doctrines. Once separated from the sustaining unity of the Church, all separations lose their spiritual cohesion, and then their intellectual identity. *Ramus proecisus arescit.*¹⁵

For the present it is enough to say that no human legislation, authority or constraint can ever create internal unity of intellect and will; and that the diversities and contradictions generated by all human systems prove the absence of Divine authority. Variations or contradictions are proof of the absence of a Divine mission to mankind. All natural causes run to disintegration. Therefore, they can

¹²An Alexandrian presbyter of the 4th century, denied the Trinity.

¹⁴Martin Luther, German reformer, 16th century: justification by faith, supremacy of Bible, and right of private judgment.

¹⁵"The fallen (or broken-off) branch becomes dry

render no account of the world-wide unity of the One Universal Church.

Such, then, are the facts before our eyes at this day. We will seek out the origin of the body or system called the Catholic Church, and pass at once to its outset eighteen hundred years ago.

I affirm, then, three things: (1) First, that no adequate account can be given of this undeniable fact from natural causes; (2) that the history of the Catholic Church demands causes above nature; and (3) that it has always claimed for itself a Divine origin and Divine authority.

I. And, first, before we examine what it was and what it has done, we will recall to mind what was the world in the midst of which it arose.

The most comprehensive and complete description of the old world, before Christianity came in upon it, is given in the first chapter of the Epistle to the Romans. Mankind had once the knowledge of God: that knowledge was obscured by the passions of sense; in the darkness of the human intellect, with the light of nature still before them, the nations worshipped the creature—that is, by pantheism, polytheism, idolatry; and, having lost the knowledge of God and of His perfections, they lost the knowledge of their own nature and of its laws, even of the natural and rational laws, which thenceforward ceased to guide, restrain, or govern them. They became perverted and inverted with every possible abuse, defeating the end and destroying the powers

of creation. The lights of nature were put out, and the world rushed headlong into confusions, of which the beasts that perish were innocent. This is analytically the history of all nations but one. A line of light still shone from Adam to Enoch, from Enoch to Abraham, to whom the command was given, "Walk before Me and be perfect." And it ran on from Abraham to Caiaphas, who crucified the founder of Christianity. Through all anthropomorphisms of thought and language this line of light still passed inviolate and inviolable. But in the world, on either side of that radiant stream, the whole earth was dark. The intellectual and moral state of the Greek world may be measured in its highest excellence in Athens; and of the Roman world in Rome. The state of Athens—its private, domestic, and public morality—may be seen in Aristophanes.¹⁶

Christianity came in "the fullness of time." What that fullness may mean, is one of the mysteries of times and seasons which it is not for us to know. But one motive for the long delay of four thousand years is not far to seek. It gave time, full and ample, for the utmost development and consolidation of all the falsehood and evil of which the intellect and will of man are capable. The four great empires were each of them the concentration of a supreme effort of human power. The sec-

¹⁶A Greek dramatist of the 4th and 5th centuries before Christ: *The Clouds* (Little Blue Book No. 647); *The Frogs* (No. 758); *The Birds* (No. 759); *Acharnians* (No. 817).

ond inherited from the first, the third from both, the fourth from all three. It was, as it was foretold or described, as a beast, "exceeding terrible; his teeth and claws were of iron; he devoured and broke in pieces; and the rest he stamped upon with his feet." The empire of man over man was never so widespread, so absolute, so hardened into one organized mass, as in Imperial Rome. The world had never seen a military power so disciplined, irresistible, invincible; a legislation so just, so equitable, so strong in its execution; a government so universal, so local, so minute. It seemed to be imperishable. Rome was called the eternal. The religions of all nations were enshrined in Dea Roma; adopted, practiced openly, and taught. They were all *religiones licitae*, known to the law; not tolerated only, but recognized. The theologies of Egypt, Greece, and of the Latin world, met in an empyreum, consecrated and guarded by the Imperial law, and administered by the Pontifex Maximus.¹⁷ No fanaticism ever surpassed the religious cruelties of Rome. Add to all this the colluvies of false philosophies of every land, and of every date. They both blinded and hardened the intellect of public opinion and of private men against the invasion of anything except contempt, and hatred of both the philosophy of sophists and of the religion of the people. Add to all this the sensuality of the most refined and of the

¹⁷The official title of the pope, as head of the priestly college of Rome; earlier, Roman head of religious worship.

a moral confusion and corruption which violated every law of nature.

The god of this world had built his city. From foundation to parapet, everything that the skill and power of man could do had been done without stint of means or limit of will. The Divine hand was stayed, or rather, as St. Augustine¹⁸ says, an unsurpassed natural greatness was the reward of certain natural virtues, degraded as they were in unnatural abominations. Rome was the climax of the power of man without God, the apotheosis of the human will, the direct and supreme antagonist of God in His own world. In this the fullness of time was come. Man built all this for himself. Certainly, man could not also build the City of God. They are not the work of one and the same architect, who capriciously chose to build first the city of confusion, suspending for a time his skill and power to build some day the City of God. Such a hypothesis is folly. Of two things, one. Disputers must choose one or the other. Both cannot be asserted, and the assertion needs no answer—it refutes itself. So much for the first point.

II. In the reign of Augustus, and in a remote and powerless Oriental race, a Child was born in a stable of a poor Mother. For thirty years He lived a hidden life; for three years He preached the Kingdom of God, and gave laws hitherto unknown to men. He died in

¹⁸One of the Latin Church fathers, 4th century: Confessions of St. Augustine (Little Blue Book No. 735).

grossest luxury the world has ever seen, and ignominy upon the Cross; on the third day He rose again; and after forty days He was seen no more. This unknown Man created the world-wide unity of intellect and will which is visible to the eye, and audible, in all languages, to the ear. It is in harmony with the reason and moral nature of all nations, in all ages, to this day. What proportion is there between the cause and the effect? What power was there in this isolated Man? What unseen virtues went out of Him to change the world? For change the world He did; and that not in the line or on the level of nature as men had corrupted it, but in direct contradiction to all that was then supreme in the world. He taught the dependence of the intellect against its self-trust, the submission of the will against its license, the subjugation of the passions by temperate control or by absolute subjection against their wilfull indulgence. This was to reverse what men believed to be the laws of nature: to make water climb upward and fire to point downward. He taught mortification of the lusts of the flesh, contempt of the lusts of the eyes, and hatred of the pride of life. What hope was there that such a teacher should convert imperial Rome? that such a doctrine should exorcise the fullness of human pride and lust? Yet so it has come to pass; and how? Twelve men more obscure than Himself, absolutely without authority or influence of this world, preached throughout the empire and beyond it. They asserted two facts: the one, that God had been

made man; the other, that He died and rose again. What could be more incredible? To the Jews the unity and spirituality of God were axioms of reason and faith; to the Gentiles, however cultured, the resurrection of the flesh was impossible. The Divine Person who had died and risen could not be called in evidence as the chief witness. He could not be produced in court. Could anything be more suspicious if credible, or less credible even if He were there to say so? All that they could do was to say, "We knew Him for three years, both before His death and after He rose from the dead. If you will believe us, you will believe what we say. If you will not believe us, we can say no more. He is not here, but in heaven. We cannot call him down." It is true, as we read, that Peter cured a lame man at the gate of the Temple. The Pharisees could not deny it, but they would not believe what Peter said; they only told him to hold his tongue. And yet thousands in one day in Jerusalem believed in the Incarnation and the Resurrection; and when the Apostles were scattered by persecution, wherever they went men believed their word. The most intense persecution was from the Jews, the people of faith and of Divine traditions. In the name of God and of religion they stoned Stephen, and sent Saul to persecute at Damascus. More than this, they stirred up the Romans in every place. As they had forced Pilate to crucify Jesus of Nazareth, so they swore to slay Paul. And yet, in spite of all, the faith spread.

It is true, indeed, that the Empire of Alex-

ander, the spread of the Hellenistic Greek, the prevalence of Greek in Rome itself, the Roman roads which made the Empire traversible, the Roman peace which sheltered the preachers of the faith in the outset of their work, gave them facilities to travel and to be understood. But these were only external facilities, which in no way rendered more credible or more acceptable the voice of penance and mortification, or the mysteries of the faith, which was immutably "to the Jews a stumbling-block and to the Greeks foolishness." It was in changeless opposition to nature as man had marred it; but it was in absolute harmony with nature as God had made it to His own likeness. Its power was its persuasiveness; and its persuasiveness was in its conformity to the highest and noblest aspirations and aims of the soul of man. The master-key so long lost was found at last; and its conformity to the wards of the lock was its irrefragable witness to its own mission and message.

But if it is beyond belief that Christianity in its outset made good its foothold by merely human causes and powers, how much more does this become incredible in every age as we come down from the first century to the nineteenth, and from the Apostolic mission to the world-wide Church, Catholic and Roman, at this day.

Not only did the world in the fullness of its power give to the Christian faith no help to root or to spread itself, but it wreaked all the fullness of its power upon it to uproot and to destroy it. Of the first thirty Pontiffs in

Rome, twenty-nine were martyred. Ten successive persecutions, or rather one universal and continuous persecution of two hundred years, with ten more bitter excesses of enmity in every province of the Empire, did all that man can do to extinguish the Christian name. The Christian name may be blotted out here and there in blood, but the Christian faith can nowhere be slain. It is inscrutable, and beyond the reach of man. In nothing is the blood of martyrs more surely the seed of faith. Every martyrdom was a witness to the faith, and ten persecutions were the sealing of the work of the twelve Apostles. The destroyer defeated himself. Christ crucified was visibly set forth before all the nations, the world was a Calvary, and the blood of the martyrs preached in every tongue the Passion of Jesus Christ. The world did its worst, and ceased only for weariness and conscious defeat.

Then came the peace, and with peace the peril of the Church. The world outside had failed; the world inside began to work. It no longer destroyed life; it perverted the intellect, and, through intellectual perversion, assailed the faith at its center. . . . Throughout the centuries every article has been in succession perverted by heresy and defined by the Church. If the human intellect could fasten its perversions on the Christian faith, it would have done so long ago; and if the Christian faith had been guarded by no more than human intellect, it would long ago have been disintegrated, as we see in every religion outside the unity of the one Catholic Church.

There is no example in which fragmentary Christianities have not departed from their original type. No human system is immutable; no thing human is changeless. The human intellect, therefore, can give no sufficient account of the identity of the Catholic faith in all places and in all ages by any of its own natural processes or powers. The force of this argument is immensely increased when we trace the traditions of the faith through the nineteen Ecumenical Councils which, with one continuous intelligence, have guarded and unfolded the deposit of faith, defining every truth as it has been successively assailed, in absolute harmony and unity of progression. . . .

(Cardinal Manning now traces these traditions, pointing out that these Councils are the Senate and Parliament of the Church—but Senates and Parliaments, due to the changeableness of purely human things, meet year by year, and these Councils, proving the unchangeableness of the Divine Church, meet scarcely once a century. Church law even corrected and elevated Imperial law; for a record of which, Manning recommends the *Gesta Christi* of Charles Loring Brace. Summarizing, Manning says: "Starting from St. Peter to Leo XIII, there have been some 258 Pontiffs claiming to be, and recognized by the whole Catholic unity as, successors of St. Peter and Vicars of Jesus Christ. To them has been rendered in every age, not only the external obedience of outward submission, but the internal obedience of faith." "Every art of destruction had been tried: martyrdom, heresy, secularity,

schism; at last, two, and three, and four claimants, or, as the world says, rival Popes, were set up, that men might believe that St. Peter had no longer a successor, and our Lord no Vicar, upon earth; for, though all might be illegitimate, only one could be the lawful and true Head of the Church. Was it only by the human power of man that the unity, external and internal, which for fourteen hundred years had been supreme, was once more restored in the Council of Constance,¹⁹ never to be broken again?")

But the inadequacy of human causes to account for the universality, unity, and immutability of the Catholic Church, will stand out more visibly if we look at the intellectual and moral revolution which Christianity has wrought in the world and upon mankind. . . .

(Christianity superseded "all theogonies and theologies of the first 4000 years.." "The monotheism of the world comes down from a primeval and Divine source. Polytheism is the corruption of men and of nations. Yet in the multiplicity of all polytheisms, one supreme Deity was always recognized. The Divine unity was imperishable." Christianity improved domestic life, instituting a strict observance of marriage. "Christianity republished the primitive law by which marriage unites only one man and one woman indissolubly in a perpetual contract." "The passions and practices of 4000 years were against the change; yet it was accomplished, and it reigns inviolate to this day, though the relaxations of schism in the East

¹⁹Held 1414-1418.

and the laxities of the West have revived the abuse of divorces, and have partially abolished the wise and salutary prohibitions which guard the homes of the faithful. These relaxations prove that all natural forces have been, and are, hostile to the indissoluble law of Christian marriage. Certainly, then, it was not by natural forces that the Sacrament of Matrimony and the legislation springing from it were enacted." "It was this that redeemed woman from the traditional degradation in which the world had held her." "The marriage state in the Christian world, though holy and good, is not the highest state. The state of virginity unto death is the highest condition of man and woman. But this is above the law of nature. It belongs to a higher order. And this life of virginity, in repression of natural passion and lawful instinct, is both above and against the tendencies of human nature. It begins in a mortification, and ends in a mastery over the movements and ordinary laws of human nature. Who will ascribe this to natural causes? and, if so, why did it not appear in the first 4000 years? And when has it ever appeared except in a handful of vestal virgins,²⁰ or in Oriental recluses, with what reality history shows? An exception proves a rule." Further, "the authority of parents, the obedience of children, the love of brotherhood, are the three active powers which have raised the society of man above the level of the old world," and Christianity is responsible for these. "The Christian law has

²⁰Priestesses of Vesta (goddess of the hearth), under vows of chastity.

taught that man can lawfully sell his labor, but that he cannot lawfully be sold, or sell himself." Manning recommends that Dr. Döllinger's *Gentile and Jew* be added to Brace's *Gesta Christi*, for confirmation of his statements. "The highest excellence of men and of nations is the civilization of Christianity. The human race has ascended into what we call Christendom, that is, into the new creation of charity and justice among men. Christendom was created by the world-wide Church as we see it before our eyes at this day. Philosophers and statesmen believe it to be the work of their own hands: they did not make it; but they have for 300 years been unmaking it by reforms and revolutions. These are destructive forces. They build up nothing." Manning cites the testimony of an English professor, who, from independent examination, decided that Christ's achievement was "like no other achievement which history records.")

III. We come now to our third point, that Christianity has always claimed a Divine origin and a Divine presence as the source of its authority and powers.

To prove this by texts from the New Testament would be to transcribe the volume; and if the evidence of the whole New Testament were put in, not only might some men deny its weight as evidence, but we should place our whole argument upon a false foundation. Christianity was anterior to the New Testament and is independent of it. The Christian Scriptures presuppose both the faith and the Church as already existing, known, and be-

lieved. (Manning gives facts to prove this last statement.) We must, therefore, seek to know what was and is Christianity before and outside of the written books; and we have the same evidence for the oral tradition of the faith as we have for the New Testament itself. Both alike were in the custody of the Church; both are delivered to us by the same witness and on the same evidence. To reject either, is logically to reject both. Happily men are not saved by logic, but by faith. The millions of men in all ages have believed by inheritance of truth divinely guarded and delivered to them. They have no need of logical analysis. They have believed from their childhood. It is the penance of the doubter and the unbeliever to regain by toil his lost inheritance. . . .

(Manning cites St. Irenæus, who was the disciple of St. Polycarp, who was the disciple of St. John:)

I have quoted these passages at length, not so much as proofs of the Catholic Faith as to show the identity of the Church at its outset with the Church before our eyes at this hour, proving that the acorn has grown up into its oak, or, if you will, the identity of the Church at this hour with the Church of the Apostolic mission. These passages show the Episcopate, its central principality, its succession, its custody of the faith, its subsequent reception and guardianship of the Scriptures, its Divine tradition and the *charisma* or Divine assistance by which its perpetuity is secured in the succession of the Apostles. This is almost verbally, after 1800 years, the decree of the Vatican Coun-

cil: *Veritatis et fidei nunquam deficientis charisma.*²¹

(He quotes further from St. Irenæus, showing the nature of the Church in his day, and proving it to be no different from what it is to-day. He asserts the possibility of proving this identity all the way down the line, by quoting various authors and writers of each century.)

The world-wide testimony of the Catholic Church is a sufficient witness to prove the coming of the Incarnate Son to redeem mankind, and to return to His Father; it is also sufficient to prove the advent of the Holy Ghost to abide with us forever. The work of the Son in this world was accomplished by the Divine acts and facts of His three-and-thirty years of life, death, Resurrection, and Ascension. The office of the Holy Ghost is perpetual, not only as the Illuminator and Sanctifier of all who believe, but also as the Life and Guide of the Church. . . .

(Manning again states that the Church claims Divine guidance, that it has kept this guidance to the present hour. To refute those who point to intervals of worldliness and corruption in the Church, he asserts that this is its human element, and the human element is always corruptible. But, however corrupt this human element may become, it can never influence or change the Divine element. "The fall of Lucifer left no stain behind him." "The Church is not on probation. It is the instru-

²¹Freely: "Divine guidance is never lacking in truth and faith."

ment of probation to the world. As the light of the world, it is changeless as the firmament." "Who can be a disciple of Jesus Christ who does not believe the words, 'On this rock I will build My Church, and the gates of hell shall not prevail against it'?"')

It is more than time that I should make an end; and to do so it will be well to sum up the heads of our argument. The Vatican Council declares that the world-wide Church is the irrefragable witness of its own legation or mission to mankind.

In proof of this I have affirmed:

1. That the imperishable existence of Christianity, and the vast and undeniable revolution that it has wrought in men and in nations, in the moral elevation of manhood and of womanhood, and in the domestic, social and political life of the Christian world, cannot be accounted for by any natural causes, or by any forces that are, as philosophers say, *intra possibilitatem naturae*, within the limits of what is possible to man.

2. That this world-wide and permanent elevation of the Christian world, in comparison with both the old world and the modern world outside of Christianity, demands a cause higher than the possibility of nature.

3. That the Church has always claimed a Divine origin, and a Divine office and authority in virtue of a perpetual Divine assistance. To this even the Christian world, in all its fragments external to the Catholic unity, bears witness. It is turned to our reproach. They rebuke us for holding the teaching of the Church

to be infallible. We take the rebuke as a testimony of our changeless faith. It is not enough for men to say that they refuse to believe this account of the visible and palpable fact of the imperishable Christianity of the Catholic and Roman Church. They must find a more reasonable, credible, and adequate account for it. This no man has yet done. The denials are many and the solutions are many; but they do not agree together. Their multiplicity is proof of their human origin. The claim of the Catholic Church to a Divine authority and to a Divine assistance is one and the same in every age, and is identical in every place. Error is not the principle of unity, nor truth of variations.

The Church has guarded the doctrine of the Apostles, by Divine assistance, with unerring fidelity. The articles of faith are today the same in number as in the beginning. The explicit definition of their implicit meaning has expanded from age to age, as the everchanging denials and perversions of the world have demanded new definitions of the ancient truth. The world is against all dogma, because it is impatient of definiteness and certainty in faith. It loves open questions and the liberty of error. Every truth defined adds to its treasure. It narrows the field of error and enlarges the inheritance of truth. The world and the Church are ever moving in opposite directions. As the world becomes more vague and uncertain, the Church becomes more definite. It moves against wind and tide, against the stress and storm of the world. There was never a more luminous evi-

dence of this supernatural fact than in the Vatican Council. For eight months all that the world could say and do, like the four months of heaven, was directed upon it. Governments, statesmen, diplomatists, philosophers, intriguers, mockers, and traitors did their utmost and their worst against it. They were in dread lest the Church should declare that by Divine assistance its Head in faith and morals cannot err;²² for if this be true, man did not found it, man cannot reform it, man cannot teach it to interpret its history or its acts. It knows its own history, and is the supreme witness of its own legation.

I am well aware that I have been writing truisms, and repeating trite and trivial arguments. They are trite because the feet of the faithful for nearly 1900 years have worn them in their daily life; they are trivial because they point to the one path in which the wayfarer, though a fool, shall not err.

HENRY EDWARD, CARDINAL MANNING,
(Cardinal Archbishop of Westminster.)

²² "Papal infallibility"—see Introduction.

A REPLY TO CARDINAL MANNING

Superstition "has ears more deaf than adders to the voice of any true decision."

PART I

Cardinal Manning has stated the claims of the Roman Catholic Church with great clearness, and apparently without reserve. The age, position and learning of this man give a certain weight to his words, apart from their worth. He represents the oldest of the Christian churches. The questions involved are among the most important that can engage the human mind. No one having the slightest regard for that superb thing known as intellectual honesty, will avoid the issues tendered, or seek in any way to gain a victory over truth.

Without candor, discussion, in the highest sense, is impossible. All have the same interest, whether they know it or not, in the establishment of facts. All have the same to gain, the same to lose. He loads the dice against himself who scores a point against the right.

Absolute honesty is to the intellectual perception what light is to the eyes. Prejudice and passion cloud the mind. In each disputant should be blended the advocate and judge.

In this spirit, having in view only the ascertainment of the truth, let us examine the arguments, or rather the statements and conclusions, of Cardinal Manning.

The proposition is that "The Church itself, by its marvelous propagation, its eminent sanctity, its inexhaustible fruitfulness in all good things, its catholic unity and invincible stability, is a vast and perpetual motive of credibility, and an irrefragable witness of its own divine legation." . . .

No one will dispute that the Catholic Church is the best witness of its own existence. The same is true of everything that exists—of every church, great and small, of every man, and of every insect.

But it is contended that the marvelous growth of propagation of the church is evidence of its divine origin. Can it be said that success is supernatural? All success in this world is relative. Majorities are not necessarily right. If anything is known—if anything can be known—we are sure that very large bodies of men have frequently been wrong. We believe in what is called the progress of mankind. Progress, for the most part, consists in finding new truths and getting rid of old errors—that is to say, getting nearer and nearer in harmony with the facts of nature, seeing with greater clearness the conditions of well-being.

There is no nation in which a majority leads the way. In the progress of mankind, the few have been the nearest right. There have been centuries in which the light seemed to emanate only from a handful of men while the rest of the world was enveloped in darkness. Some great man leads the way—he becomes the morning star, the prophet of a coming day. Afterwards, many millions accept his views. But

there are still heights above and beyond; there are other pioneers, and the old day, in comparison with the new, becomes a night. So we cannot say that success demonstrates either divine origin or supernatural aid.

We know, if we know anything, that wisdom has often been trampled beneath the feet of the multitude. We know that the torch of science has been blown out by the breath of the hydra-headed. We know that the whole intellectual heaven has been darkened again and again. The truth or falsity of a proposition cannot be determined by ascertaining the number of those who assert, or of those who deny.

If the marvelous propagation of the Catholic Church proves its divine origin, what shall we say of the marvelous propagation of Mohammedanism?

Nothing can be clearer than that Christianity arose out of the ruins of the Roman Empire—that is to say, the ruins of Paganism. And it is equally clear that Mohammedanism arose out of the wreck and ruin of Catholicism.

After Mohammed came upon the stage, "Christianity was forever expelled from its most glorious seats—from Palestine, the scene of its most sacred recollections; from Asia Minor, that of its first churches; from Egypt, whence issued the great doctrine of Trinitarian Orthodoxy, and from Carthage, who imposed her belief on Europe." Before that time "the ecclesiastical chiefs of Rome, Constantinople, and of Alexandria were engaged in a desperate struggle for supremacy, carrying out their purposes

by weapons and in ways revolting to the conscience of man. Bishops were concerned in assassinations, poisonings, adulteries, blindings, riots, treasons, civil war. Patriarchs and primates were excommunicating and anathematizing one another in their rivalries for earthly power—bribing eunuchs with gold and courtesans and royal females with concessions of episcopal love. Among legions of monks who carried terror into the imperial armies and riot into the great cities arose hideous clamors for theological dogmas, but never a voice for intellectual liberty or the outraged rights of man.

“Under these circumstances, amid these atrocities and crimes, Mohammed arose, and raised his own nation from Fetichism, the adoration of the meteoric stone, and from the basest idol worship, and irrevocably wrenched from Christianity more than half—and that by far the best half—of her possessions, since it included the Holy Land, the Birthplace of the Christian faith, and Africa, which had imparted to it its Latin form; and now, after a lapse of more than a thousand years, that continent, and a very large part of Asia, remain permanently attached to the Arabian doctrine.”

It may be interesting in this connection to say that the Mohammedan now proves the divine mission of his apostle by appealing to the marvelous propagation of the faith. If the argument is good in the mouth of a Catholic, is it not good in the mouth of a Moslem? Let us see if it is not better.

According to Cardinal Manning, the Cath-

olic Church triumphed only over the institutions of men—triumphed only over religions that had been established by men—by wicked and ignorant men. But Mohammed triumphed not only over the religions of men, but over the religion of God. This ignorant driver of camels, this poor, unknown, unlettered boy, unassisted by God, unenlightened by supernatural means, drove the armies of the true cross before him as the winter's storm drives withered leaves. At his name, priests, bishops, and cardinals fled with white faces—popes trembled, and the armies of God, fighting for the true faith, were conquered on a thousand fields.

If the success of a church proves its divinity, and after that another church arises and defeats the first, what does that prove?

Let us put this question in a milder form: Suppose the second church lives and flourishes in spite of the first, what does that prove?

As a matter of fact, however, no church rises with everything against it. Something is favorable to it, or it could not exist. If it succeeds and grows, it is absolutely certain that the conditions are favorable. If it spreads rapidly, it simply shows that the conditions are exceedingly favorable, and that the forces in opposition are weak and easily overcome . . .

(Ingersoll cites the example of the Mormon Church and its growth in America, of Joseph Smith and his golden plates translated "by the use of miraculous mirrors," of its miracles, and wonders, and absurd dogmas. "If there should be Mormon bishops in all the countries of the world, 1800 years from now, do you think a cardinal of that faith could prove the truth of

the golden plates simply by the fact that the faith had spread and that 700 bishops had knelt before the head of that church?")

It seems to me that a "supernatural" religion—that is to say, a religion that is claimed to have been divinely founded and to be authenticated by miracles, is much easier to establish among an ignorant people than any other—and the more ignorant the people, the easier such a religion could be established. The reason for this is plain. All ignorant tribes, all savage men, believe in the miraculous, in the supernatural. The conception of uniformity, of what may be called the eternal consistency of nature, is an idea far above their comprehension. They are forced to think in accordance with their minds, and as a consequence they account for all phenomena by the acts of superior beings—that is say, by the supernatural. In other words, that religion having most in common with the savage, having most that was satisfactory to his mind, or to his lack of mind, would stand the best chance of success.

It is probably safe to say that at one time, or during one phase of the development of man, everything was miraculous. After a time, the mind slowly developing, certain phenomena, always happening under like conditions, were called "natural," and none suspected any special interference. The domain of the miraculous grew less and less—the domain of the natural larger; that is to say, the common became the natural, but the uncommon was still regarded as the miraculous. The rising and setting of the sun ceased to excite the wonder of mankind—there was no miracle about that; but an eclipse of the sun was miraculous. Men did not then know that eclipses are periodical, that they happen with the same certainty that the sun rises. It took many observations through many generations to arrive at this con-

clusion. Ordinary rains became "natural," floods remained "miraculous."

But it can all be summed up in this: The average man regards the common as natural, the uncommon as supernatural. The educated man—and by that I mean the developed man—is satisfied that all phenomena are natural, and that the supernatural does not and cannot exist.

As a rule, an individual is egotistic in the proportion that he lacks intelligence. The same is true of nations and races. The barbarian is egotistic enough to suppose that an Infinite Being is constantly doing something, or failing to do something, on his account. But as man rises in the scale of civilization, as he becomes really great, he comes to the conclusion that nothing in Nature happens on his account—that he is hardly great enough to disturb motions of the planets.

(Applying all this, Ingersoll asserts that either Mormonism or Catholicism could have spread only among people who were naturally credulous—"by men incapable of reasoning upon such questions. It did not, it has not, it cannot triumph over the intellectual world." And counting its millions of followers proves nothing. "There was a time when the rotation of the earth was not believed by the majority.")

Let us press this idea further. There was a time when Christianity was not in the majority, anywhere. Let us suppose that the first Christian missionary had met a prelate of the Pagan faith, and suppose this prelate had used against the Christian missionary the Cardinal's argument—how could the missionary have answered if the Cardinal's argument is good?

But, after all, is the success of the Catholic Church a marvel? If this church is of divine origin, if it has been under the especial care, protection and guidance of an Infinite Being, is not its failure far more wonderful than its

success? For eighteen centuries it has persecuted and preached, and the salvation of the world is still remote. This is the result, and it may be asked whether it is worthwhile to try to convert the world to Catholicism.

Are Catholics better than Protestants? Are they nearer honest, nearer just, more charitable? Are Catholic nations better than Protestant? Do Catholic nations move in the van of progress? Within their jurisdiction are life, liberty and property safer than anywhere else? Is Spain the first nation of the world?

Let me ask another question. Are Catholics or Protestants better than Freethinkers? Has the Catholic Church produced a greater man than Humboldt? Has the Protestant produced a greater than Darwin? Was not Emerson, so far as purity of life is concerned, the equal of any true believer? Was Pius IX, or any other vicar of Christ, superior to Abraham Lincoln?

(Replying to the repeated argument that the Catholic Church is universal, and that its universality proves its divinity, Ingersoll calls attention to the fact that at the end of the 15th century the Western Hemisphere was still in darkness. "Certainly the Catholic Church was not then universal." And today there are untold millions of China, Japan, India, Africa. "Can it truthfully be said that the Catholic Church is now universal?")

The Cardinal next tries to prove that the Catholic Church is divine, "by its eminent sanctity and its inexhaustible fruitfulness in all good things."

And here let me admit that there are many millions of good Catholics—that is, of good men and women who are Catholics. It is unnecessary to charge universal dishonesty or hypocrisy, for the reason that this would be only a kind of personality. Many thousands of heroes have died in defense of the faith, and millions

of Catholics have killed and been killed for the sake of their religion.

And here it may be well enough to say that martyrdom does not even tend to prove the truth of a religion. The man who dies in flames, standing by what he believes to be true, establishes, not the truth of what he believes, but his sincerity.

Without calling in question the intentions of the Catholic Church, we can ascertain whether it has been "inexhaustibly fruitful in all good things," and whether it has been "eminent for its sanctity."

In the first place, nothing can be better than goodness. Nothing is more sacred, or can be more sacred, than the well-being of man. All things that tend to increase or preserve the happiness of the human race are good—that is to say, they are sacred. All things that tend to the destruction of man's well-being, that tend to his unhappiness, are bad, no matter by whom they are taught or done.

It is perfectly certain that the Catholic Church has taught and still teaches that intellectual liberty is dangerous—that it should not be allowed. It was driven to take this position because it had taken another. It taught, and still teaches, that a certain belief is necessary to salvation. It has always known that investigation and inquiry led, or might lead, to doubt; that doubt leads, or may lead, to heresy, and that heresy leads to hell. In other words, the Catholic Church has something more important than this world, more important than the well-being of man here. It regards this life as an opportunity for joining that church, for accepting that creed, and for the saving of your soul.

If the Catholic Church is right in its premises, it is right in its conclusion. If it is necessary to believe the Catholic creed in order to

obtain eternal joy, then, of course, nothing else in this world is, comparatively speaking, of the slightest importance. Consequently, the Catholic Church has been, and still is, the enemy of intellectual freedom, of investigation, of inquiry—in other words, the enemy of progress in secular things.

The result of this was an effort to compel all men to accept the belief necessary to salvation. This effort naturally divided itself into persuasion and persecution.

It will be admitted that the good man is kind, merciful, charitable, forgiving and just. A church must be judged by the same standard If the church imprisons a man for the expression of an honest opinion, is it not certain, either that the doctrine of the church is wrong, or that the church is bad? Both cannot be good. "Sanctity" without goodness is impossible. Thousands of "saints" have been the most malicious of the human race. If the history of the world proves anything, it proves that the Catholic Church was for many centuries the most merciless institution that ever existed among men. I cannot believe that the instruments of persecution were made and used by the eminently good; neither can I believe that honest people were imprisoned, tortured, and burned at the stake by a church that was "inexhaustibly fruitful in all good things."

And let me say here that I have no Protestant prejudices against Catholicism, and have no Catholic prejudices against Protestantism. I regard all religions either without prejudice or with the same prejudice. They were all, according to my belief, devised by men, and all have for a foundation ignorance of this world and fear of the next. . . . I believe myself to be in a frame of mind to justly and fairly consider the claims of different religions, be-

lieving as I do that all are wrong, and admitting as I do that there is some good in all.

(Ingersoll cites an inventory of horror, selected from the Inquisition, against the Cardinal's characterization of "fruitful in all good things." He calls to witness "millions in the darkness of dungeons—millions who perished by the sword—vast multitudes destroyed in flames—those who were flayed alive—those who were blinded—those whose tongues were cut out—those into whose ears were poured molten lead—those whose eyes were deprived of their lids—those who were tortured and tormented in every way by which pain could be inflicted and human nature overcome." Indeed, not satisfied with this, he asserts that the church "threatened punishment here, imprisonment here, burnings here, and, in the name of their God, eternal imprisonment and eternal burnings hereafter." "We know, too, that the Catholic Church was, during all the years of its power, the enemy of every science." It "opposed every discovery calculated to improve the condition of mankind." "Think of a woman—the mother of a family—taken from her children and burned, on account of her view as to the three natures of Jesus Christ." "Think of this church, 'fruitful in all good things,' launching its course at an honest man—not only cursing him from the crown of his head to the soles of his feet with a fiendish particularity, but having at the same time the impudence to call on God, and the Holy Ghost, and Jesus Christ, and the Virgin Mary, to join in the curse; and to curse him not only here, but forever hereafter—calling upon all the saints and upon all the redeemed to join in a hallelujah of curses, so that earth and heaven would reverberate with countless curses launched at a human being solely for having

expressed an honest thought." This church allowed men to "rot in dungeons, because they were guilty of the crime of having been suspected" of heresy.)

(It is too late, Ingersoll says, to speak of the "invincible stability" of the Catholic Church. It was not invincible in the 7th, 8th, or 9th centuries; it is not invincible today in Scotland, England, Paris, or Berlin, or in "any intellectual center of the world." Against the goodness of the argument that the church "interpenetrates all the nations of the civilized world" and "in some holds the whole nation in its unity," he cites the example of Spain, one of the most Catholic of countries. Spain "imprisoned the honest, burned the noble, and succeeded after many years of devotion to the true faith, in destroying the industry, the intelligence, the usefulness, the genius, the nobility and the wealth of a nation. It became a wreck, a jest of the conquered, and excited the pity of its former victims. In this period of degradation, the Catholic Church held 'the whole nation in its unity'." But Spain changed, and made alliances with infidel powers—Turkey, Tripoli, Algiers, the Barbary States. "Spain has progressed in the arts and sciences, in all that tends to enrich and ennoble a nation, in the precise proportion that she has lost faith in the Catholic Church. . . . Spain is not yet clothed in her right mind. A few years ago the cholera visited Madrid and other cities. Physicians were mobbed. Processions of saints carried the host through the streets for the purpose of staying the plague. The streets were not cleaned; the sewers were filled. Filth and faith, old partners, reigned supreme. The church, 'eminent for its sanctity,' stood in the light and cast its shadow on the ignorant and the prostrate." Ingersoll does not disparage the heroism of some of these religious men in

visiting the sick. But their religion caused what it could not prevent. "Goodness is not enough—intelligence is necessary.")

It is admitted that the Catholic Church exists in many nations; that it is dominated, at least in a great degree, by the Bishop of Rome—that it is international in that sense, and that in that sense it has what may be called a "supernational unity." The same, however, is true of the Masonic fraternity. It exists in many nations, but it is not a national body. It is in the same sense extranational, in the same sense international, and has in the same sense a supernational unity. So the same may be said of other societies. This, however, does not tend to prove that anything supernational is supernatural.

It is also admitted that in faith, worship, ceremonial, discipline, and government, the Catholic Church is substantially the same wherever it exists. This establishes the unity, but not the divinity, of the institution.

The church that does not allow investigation, that teaches that all doubts are wicked, attains unity through tyranny, that is, monotony by repression. Wherever man has had something like freedom, differences have appeared, heresies have taken root, and the divisions have become permanent—new sects have been born and the Catholic Church has been weakened. The boast of unity is the confession of tyranny

(Ingersoll analyzes the Cardinal's statement, or rather his rhetorical question: "Was it only by the human power of man that the unity, external and internal, which for 1,400 years had been supreme, was once more restored in the Council of Constance, never to be broken again?" This is an admission that the unity of the Catholic Church had been broken, with a boast that it will never be broken again—

but this unity has been used as an argument for the divinity of the church. Once, then, this argument failed, for the unity was broken for years.)

Let us state the case in another way. Let us suppose that a man has a sword which he claims was made by God, stating that the reason he knows that God made the sword is that it never had been and never could be broken. Now, if it was afterwards ascertained that it had been broken, and the owner admitted that it had been, what would be thought of him if he then took the ground that it had been welded, and that the welding was the evidence that it was of divine origin?

A prophecy is then indulged in, to the effect that the internal and external unity of the church can never be broken again. It is admitted that it was broken—it is asserted that it was divinely restored—and then it is declared that it is never to be broken again. No reason is given for this prophecy; it must be born of the facts already stated. Put in a form to be easily understood, it is this:

We know that the unity of the church can never be broken, because the church is of divine origin.

We know that it was broken; but this does not weaken the argument, because it was restored by God, and it has not been broken since.

Therefore, it can never be broken again.

It is stated that the Catholic Church is immutable, and that its immutability establishes its claim to divine origin. Was it immutable when its unity, internal and external, was broken? Was it precisely the same after its unity was broken that it was before? Was it precisely the same after its unity was divinely restored that it was while broken? Was it

universal while it was without unity? Which of the fragments was universal—which was immutable?

The fact that Catholics are to a great extent obedient to the pope establishes nothing except the thoroughness of the organization. . . . How was the Roman empire formed? . . . How is it that the few enslave the many? . . . The answer is in one word, Organization. The organized few triumph over the unorganized many.

We must remember that when Christianity was established the world was ignorant, credulous and cruel. The gospel with its idea of forgiveness—with its heaven and hell—was suited to the barbarians among whom it was preached. Let it be understood, once for all, that Christ had but little to do with Christianity. The people became convinced—being ignorant, stupid and credulous—that the church held the keys of heaven and hell. The foundation for the most terrible mental tyranny that has existed among men was in this way laid. . . . The Catholic Church resorted to every possible form of fraud; . . . tortured the accused to make them confess; it tortured witnesses to compel the commissions of perjury; it tortured children to make them convict their parents. . . . It was the enemy of intelligence, the assassin of liberty, and the destroyer of progress. It loaded the noble with chains and the infamous with honors. In one hand it carried the alms dish, in the other a dagger. It argued with the sword, persuaded with poison, and convinced with the fagot.

It is impossible to see how the divine origin of a church can be established by showing that hundreds of bishops have visited the pope. (This is the old argument of majority-proof. By it, a million pilgrims visiting Mecca should prove the truth of the Koran. "As a rule,

arrogance and humility go together. He who in power compels his fellow-man to kneel, will himself kneel when weak. . . . Great men stand face to face. They meet on equal terms. . . . The man of free and noble spirit will not kneel. Courage has no knees. Fear kneels, or falls upon its ashen face.")

The Cardinal insists that the pope is the vicar of Christ, and that all popes have been. What is a vicar of Christ? He is a substitute in office. He stands in the place, or occupies the position in relation to the church, in relation to the world, that Jesus Christ would occupy were he the pope at Rome. In other words, he takes Christ's place: so that, according to the doctrine of the Catholic Church, Jesus Christ himself is present in the person of the pope.

We all know that a good man may employ a bad agent. A good king might leave his realm and put in his place a tyrant and a wretch. . . . But if the king appointed a bad vicar, knowing him to be bad, knowing that he would imprison and burn the noble and generous, what excuse can be imagined for such a king?

Now, if the church is of divine origin, and if each pope is the vicar of Jesus Christ, he must have been chosen by Jesus Christ; and when he was chosen, Christ must have known exactly what his vicar would do. Can we believe that an infinitely wise and good Being would choose immoral, dishonest, ignorant, malicious, heartless, fiendish, and inhuman vicars?

The Cardinal admits that "this history of Christianity is the history of the church, and that the history of the church is the history of the Pontiffs," and he then declares that "the greatest statesmen and rulers that the world has ever seen are the Popes of Rome."

(In refutation, Ingersoll quotes from Draper's *History of the Intellectual Development of Europe*. One passage will give the key to all.)

"From 896 to 900 five popes were consecrated. Leo V, in less than two months after he became pope, was cast into prison by Christopher, one of his chaplains. This Christopher usurped his place, and in a little while was expelled from Rome by Sergius III, who became pope in 905. This pope lived in criminal intercourse with the celebrated Theodora, who with her daughters, Marozia and Theodora, both prostitutes, exercised an extraordinary control over him. The love of Theodora was also shared by John X. She gave him the Archbishopric of Ravenna, and made him pope in 915. The daughter of Theodora overthrew this pope. She surprised him in the Lateran Palace. His brother, Peter, was killed; the pope was thrown into prison, where he was afterward murdered. Afterward, this Marozia, daughter of Theodora, made her own son pope, John XI. Many affirmed that Pope Sergius was his father, but his mother inclined to attribute him to her husband, Alberic, whose brother Guido she afterward married. Another of her sons, Alberic, jealous of his brother John, the pope, cast him and their mother into prison. Alberic's son was then elected pope as John XII.

"John was nineteen years old when he became the vicar of Christ. His reign was characterized by the most shocking immoralities, so that the Emperor Otho I was compelled by the German clergy to interfere. He was tried. It appeared that John had received bribes for the consecration of bishops; that he had ordained one who was only ten years old; that he was charged with incest, and with so many adulteries that the Lateran Palace had become

a brothel. He put out the eyes of one ecclesiastic; he maimed another—both dying in consequence of their injuries. He was given to drunkenness and to gambling. He was deposed at last, and Leo VII elected in his stead. Subsequently he got the upper hand. He seized his antagonists; he cut off the hand of one, the nose, the finger, and the tongue of others. His life was eventually brought to an end by the vengeance of a man whose wife he had seduced."

And yet, I admit that the most infamous popes, the most heartless and fiendish bishops, friars, and priests were models of mercy, charity and justice when compared with the orthodox God—with the God they worshiped. These popes, these bishops, these priests could persecute only for a few years—they could burn only for a few moments—but their God threatened to imprison and burn forever; and their God is as much worse than they were, as hell is worse than the Inquisition. . . .

It must be remembered that the popes were assassinated by Catholics—murdered by the faithful—that one vicar of Christ strangled another vicar of Christ, and that these men were "the greatest rulers and statesmen of the earth." . . .

It may be sufficient to say here that there is no crime that man can commit that has not been committed by the vicars of Christ. They have inflicted every possible torture, violated every natural right. Greater monsters the human race has not produced.

Among the "some 258" vicars of Christ there were probably some good men. This would have happened even if the intention had been to get all bad men, for the reason that man reaches perfection neither in good nor in evil; but if they were selected by Christ himself, if

they were selected by a church with a divine origin and under divine guidance, then there is no way to account for the selection of a bad one. If one hypocrite was duly elected pope—one murderer, one strangler, one starver—this demonstrates that all the popes were selected by men, and by men only, and that the claim of divine guidance is born of zeal and uttered without knowledge.

But who were the vicars of Christ? How many have there been? Cardinal Manning himself does not know. He is not sure. He says: "Starting from St. Peter to Leo XIII, there have been *some* 258 Pontiffs claiming to be recognized by the whole Catholic unity as successors of St. Peter and Vicars of Jesus Christ." Why did he use the word "some"? Why "claiming"? Does he not positively know? Is it possible that the present Vicar of Christ is not certain as to the number of his predecessors? Is he infallible in faith and fallible in fact?

ROBERT G. INGERSOLL.

PART II

If we live thus tamely,—
To be thus jaded by a piece of scarlet,—
Farewell nobility.

No one will deny that "the pope speaks to many people in many nations; that he treats with empires and governments," and that "neither from Canterbury nor from Constantinople such a voice goes forth."

How does the pope speak? What does he say?

He speaks against the liberty of man—against the progress of the human race. He speaks to calumniate the thinkers, and to warn the faithful against the discoveries of science. He speaks for the destruction of civilization.

Who listens? Do astronomers, geologists, and scientists put the hand to the ear fearing that an accent may be lost? Does France listen? Does Italy hear? Is not the church weakest at its center? Does Great Britain care for this voice—this moan, this groan—of the Middle Ages? Do the words of Leo XIII impress the intelligence of the Great Republic? Can anything be more absurd than for the vicar of Christ to attack a demonstration of science with a passage of Scripture, or a quotation from one of the "Fathers"?

(Ingersoll urges comparison between the popes and "human" monarchs—kings, queens, presidents. "If Adams had murdered Washington, and Jefferson had imprisoned Adams, and if Madison had cut off Jefferson's tongue . . . the verdict of the world would be that the people are not capable of selecting their presidents." But the pope grows weaker, being tormented, as Manning admits, "by Falk laws, by Mancini laws, and by Crispi laws." "Is it possible that this patriotic trinity is more powerful than the other?" Ingersoll scoffs at the notion that the Catholic religion is divine, and all other religions are the work of man. All are the work of men. Every dogma, creed, and nation has a predecessor in some faith before Catholicism.)

The founders of many religions have insisted that it was the duty of man to renounce the pleasures of sense, and millions before our era took the vows of chastity, poverty and obedience, and most cheerfully lived upon the labor of others.

The sacraments of baptism and confirmation are far older than the Church of Rome. The Eucharist is pagan. Long before popes began to murder each other, pagans ate cakes

—the flesh of Ceres, and drank wine—the blood of Bacchus. Holy water flowed in the Ganges and Nile, priests interceded for the people, and anointed the dying.

(Other religions have had as many good points as Catholicism, if also as many bad. If perpetuation without change is urged as proof of divinity, what of Buddhism? "Is intellectual stagnation a demonstration of divine origin?" "Differentiation is the law of growth, of progress. Every church must gain or lose; it cannot remain the same; it must decay or grow.")

It is not true that "All natural causes run to disintegration." Natural causes run to integration as well as to disintegration. All growth is integration, and all growth is natural. All decay is disintegration, and all decay is natural. Nature builds and nature destroys. . . . But if the Cardinal is right, then every success must have been of divine origin, and nothing is natural but destruction. . . . According to this doctrine, if anything lives and grows, it does so in spite of nature. Growth, then, is not in accordance with, but in opposition to nature. Every plant is supernatural—it defeats the disintegrating influences of rain and light. The generalization of the Cardinal is half the truth. It would be equally true to say: All natural causes run to integration. But the whole truth is that growth and decay are equal.

(Ingersoll takes the Cardinal's words: "Christendom was created by the world-wide church as we see it before our eyes at this day. Philosophers and statesmen believe it to be the work of their own hands; they did not make it, but they have for 300 years been unmaking it by reformations and revolutions," and, saying that this proves Christendom has

been a failure, gradually weakening, for 300 years, he undertakes to show what it was just 300 years ago, at the height of its power. He cites Philip II of Spain—"he with the cramped head and the monstrous jaw"; the Duke of Alva's reign of terror in Holland; the Armada on the sea to flail the heretics of England; Charles IX of France, "after nearly sixteen centuries of Catholic Christianity," order the infamous massacre of St. Bartholomew,²³ "the result of a conspiracy between the Vicar of Christ, Philip II, Charles IX, and his fiendish mother" (Catherine de Medici). At that time, too, Clement VIII, Vicar of Christ, persecuted Giordano Bruno.²⁴)

There are two things that cannot exist in the same universe—an infinite God and a martyr.

Does the Cardinal regret that kings and emperors are not now engaged in the extermination of Protestants? Does he regret that dungeons of the Inquisition are no longer crowded with the best and bravest?

In coming to a conclusion as to the origin of the Catholic Church—in determining the truth of the claim of infallibility—we are not restricted to the physical achievements of its propagation, or to the rapidity of its growth.

This church has a creed; and if this church is of divine origin—if its head is the vicar of Christ, and, as such, infallible in matters of faith and morals, this creed must be true. Let us start with the supposition that God exists, and that he is infinitely wise, powerful and good—and this is only a supposition.

²³Aug. 24, 1572—Protestants and Huguenots massacred by Catholics.

²⁴Bruno: His life and Martyrdom (Little Blue Book No. 51).

Now, if the creed is foolish, absurd and cruel, it cannot be of divine origin. We find in this creed the following:

"Whosoever will be saved, before all things it is necessary that he hold the Catholic faith."

It is not necessary, before all things, that he be good, honest, merciful, charitable and just. Creed is more important than conduct. The most important of all things is that he hold the Catholic faith. There were thousands of years during which it was not necessary to hold that faith, because that faith did not exist; and yet during that time the virtues were just as important as now, just as important as they ever can be. Millions of the noblest of the human race never heard of this creed. Millions of the bravest and best have heard of it, examined, and rejected it. Millions of the most infamous have believed it, and because of their belief, or notwithstanding their belief, have murdered millions of their fellows. We know that men can be, have been, and are just as wicked with it as without it. We know that it is not necessary to believe it to be good, loving, tender, noble and self-denying. We admit that millions who have believed it have also been self-denying and heroic, and that millions, by such belief, were not prevented from torturing and destroying the helpless.

Now, if all who believed it were good, and all who rejected it were bad, then there might be some propriety in saying that "whoever will be saved, before all things it is necessary that he hold the Catholic faith." But as the experience of mankind is otherwise, the declaration becomes absurd, ignorant and cruel.

There is still another clause:

"Which faith, except everyone do keep entire

and inviolate, without doubt, he shall everlastingly perish."

We now have both sides of this wonderful truth: The believer will be saved, the unbeliever will be lost. We know that faith is not the child or servant of the will. We know that belief is a conclusion based upon what the mind supposes to be true. We know that it is not an act of the will. Nothing can be more absurd than to save a man because he is not intelligent enough to accept the truth, and nothing can be more infamous than to damn a man because he is intelligent enough to reject the false. It resolved itself into a question of intelligence. If the creed is true, then a man rejects it because he lacks intelligence. Is this a crime for which a man should everlastingly perish? If the creed is false, then a man accepts it because he lacks intelligence. In both cases the crime is exactly the same. If a man is to be damned for rejecting the truth, certainly he should not be saved for accepting the false. This one clause demonstrates that a being of infinite wisdom and goodness did not write it. It also demonstrates that it was the work of men who had neither wisdom nor a sense of justice.

What is this Catholic faith that must be held? It is this:

"That we worship one God in Trinity and Trinity in Unity, neither confounding the persons nor dividing the substance."

(Ingersoll demands: "Why should we pray to one God and think of three, or pray to three Gods and think of one?" "When you think of three as one, what do you do with the other two?" He goes on to the claim that the Catholic Church has preached the one true

God and has destroyed idols "by light instead of fire.")

The Catholic Church described the true God as a being who would inflict eternal pain on his weak and erring children; described him as a fickle, quick-tempered, unreasonable deity, whom honesty enraged, and whom flattery governed; one who loved to see fear upon its knees, ignorance with closed eyes and open mouth; one who delighted in useless self-denial, who loved to hear the sighs and sobs of suffering nuns, as they lay prostrate on dungeon floors; one who was delighted when the husband deserted his family and lived alone in some cave in the far wilderness, tormented by dreams and driven to insanity by prayer and penance, by fasting and faith.

According to the Catholic Church, the true God enjoyed the agonies of heretics. He loved the smell of their burning flesh; he applauded with wide palms when philosophers were flayed alive, and to him the *auto da fé*²⁵ was a divine comedy. The shrieks of wives, the cries of babes when fathers were being burned, gave contrast, heightened the effect and filled his cup with joy. . . .

It may also be said that the Catholic Church filled the world with the true knowledge of the one true Devil. . . . And yet, we are compelled to say, that the one true Devil described by the Catholic Church was not as malevolent as the one true God.

Is it true that the Catholic Church overthrew idolatry? What is idolatry? What shall we say of the worship of popes—of the doctrine of

²⁵"Act of faith"—applied to the ceremonial accompanying the execution of a punishment of the notorious Inquisition. Burnings of heretics were thus "autos da fé."

the Real Presence, of divine honors paid to saints, of sacred vestments, of holy water, of consecrated cups and plates, of images and relics, of amulets and charms? . . . Has the Cardinal forgotten the Council of Nice, held in the year of grace 787, that declared the worship of images to be lawful? Did that infallible Council, under the guidance of the Holy Ghost, destroy idolatry?

The Cardinal takes the ground that marriage is a sacrament, and therefore indissoluble, and he also insists that celibacy is far better than marriage,—holier than a sacrament,—that marriage is not the highest state, but that "the state of virginity unto death is the highest condition of man and woman."

The highest ideal of a family is where all are equal—where love has superseded authority—where each seeks the good of all, and where none obey—where no religion can sunder hearts, and with which no church can interfere.

The real marriage is based on mutual affection—the ceremony is but the outward evidence of the inward flame. To this contract there are but two parties. The church is an impudent intruder. Marriage is made public to the end that the real contract may be known, so that the world can see that the parties have been actuated by the highest and holiest motives that find expression in the acts of human beings. . . . The indissolubility of marriage is a dogma that has filled the lives of millions with agony and tears. It has given a perpetual excuse for vice and immorality. Fear has borne children begotten by brutality. Countless women have endured the insults, indignities and cruelties of fiendish husbands, because they thought that it was the will of

God. The contract of marriage is the most important that human beings can make; but no contract can be so important as to release one of the parties from the obligation of performance; and no contract, whether made between man and woman, or between them and God, after a failure of consideration caused by the wilful act of the man or woman, can hold and bind the innocent and honest.

Do the believers in indissoluble marriage treat their wives better than others? . . . Thousands of husbands, who insist that marriage is indissoluble, are the beaters of wives.

The law of the church has created neither the purity nor the peace of domestic life. Back of all churches is human affection. Back of all theologies is the love of the human heart. Back of all your priests and creeds is the adoration of the one woman by the one man, and of the one man by the one woman. Back of your faith is the fireside; back of your folly is the family; and back of all your holy mistakes and your sacred absurdities is the love of husband and wife, of parent and child.

It is not true that neither the Greek nor the Roman world had any true conception of a home. The splendid story of Ulysses and Penelope, the parting of Hector and Andromache, demonstrates that a true conception of a home existed among the Greeks. . . . This church taught the uncleanness of marriage, and insisted that all children were conceived in sin. . . . Did this tend to the elevation of woman? Is it true that a monk is purer than a good and noble father?—that a nun is holier than a loving mother? . . .

The good man is useful, the best man is the most useful. Those who fill the nights with barren prayers and holy hunger torture them-

selves for their own good and not for the benefit of others. . . . Celibacy is the essence of vulgarity. It tries to put a stain upon motherhood, upon marriage, upon love—that is to say, upon all that is holiest in the human heart. Take love from the world and there is nothing left worth living for. The church has treated this great, this sublime, this unspeakably holy passion, as though it polluted the heart. They have placed the love of God above the love of woman, above the love of man. Human love is generous and noble. The love of God is selfish, because man does not love God for God's sake, but for his own. . . . The Cardinal ought to take the ground that to talk well is good, but that to be dumb is the highest condition; that hearing is a pleasure, but that deafness is ecstasy; and that to think, to reason, is very well, but that to be a Catholic is far better.

Why should we desire the destruction of human passions? Take passions from human beings and what is left? The great object should be not to destroy passions, but to make them obedient to the intellect. To indulge passion to the utmost is one form of intemperance—to destroy passion is another. The reasonable gratification of passion, under the domination of the intellect is true wisdom and perfect virtue. . . .

(Because celibacy is against nature, Manning asserted that its practice proved divine guidance. Ingersoll demands to know whether a mother throwing her babe into the Ganges to please a supposed God is not also against nature, and is not also proof of divinity? "Yet a religion that insisted on that sacrifice succeeded, and has, today, more believers than the Catholic Church can boast.")

It is illogical to take the ground that the

world was cruel and ignorant and idolatrous when the Catholic Church was established, and that because the world is better now than then, the church is of divine origin.

What was the world when science came? . . . Would it not be much easier to prove that science is of divine origin?

Science does not persecute. It does not shed blood—it fills the world with light. It cares nothing for heresy; it develops the mind, and enables man to answer his own prayers.

(Proceeding to the Cardinal's assertion that God waited until the world of man reached its highest culmination of evil before offering his Gospel to redeem it, Ingersoll asks: "Why should an infinitely wise God desire this development and consolidation? What would be thought of a father who should refuse to teach his son and deliberately allow him to go into every possible excess, to the end that he might 'develop all the falsehood and evil of which his intellect and will were capable'?" "It is declared that the history of Rome shows what man can do without God, and I assert that the history of the Inquisition shows what man can do when assisted by a church of divine origin, presided over by the infallible vicars of God." Ingersoll points out that the Cardinal says his religion is in harmony with nature, and yet insists that it is supernatural. In reply to the argument that since the Pagans failed to destroy the church by persecution, it must be of divine origin, he summarizes a logical sequence.)

Paganism failed to destroy Catholicism by persecution; therefore, Catholicism is of divine origin.

Catholicism failed to destroy Protestantism

by persecution; therefore, Protestantism is of divine origin.

Catholicism and Protestantism combined failed to destroy Infidelity; therefore, Infidelity is of divine origin.

Let us make another application:

Paganism did not succeed in destroying Catholicism; therefore, Paganism was a false religion.

Catholicism did not succeed in destroying Protestantism; therefore, Catholicism is a false religion.

Catholicism and Protestantism combined failed to destroy Infidelity; therefore, both Catholicism and Protestantism are false religions.

(Ingersoll now gives a long array of facts and rebuttals to disprove the theory that the Canon Law is inspired. Since a heretic, under this law, could not be a witness against a Catholic, "A Catholic could enter the house of an unbeliever, and before the eyes of the husband and father murder his wife and children, and the father could not pronounce in the hearing of a judge the name of the murderer." "The world is wiser now, and the Canon Law, given to us by infinite wisdom, has been repealed by the common sense of man." Under this old law, giving aid to the heretic or to the excommunicated was a crime. "Is it possible that a being of infinite wisdom made hospitality a crime?" He assumes the importance of sheep knowing their shepherd, yet he gives facts to show that the Catholics did not always know their pope—in the case of rival popes, they could not tell the genuine from the counterfeit. Ingersoll discounts the Cardinal's quotations from St. Irenæus, asserting: "The Cardinal's case depends upon the intelligence and

veracity of his witnesses. The Fathers of the church were utterly incapable of examining a question of fact. They were all believers in the miraculous. The same is true of the apostles.")

What is the testimony of St. John worth in the light of the following? "Cerinthus, the heretic, was in a bathhouse. St. John and another Christian were about to enter. St. John cried out: 'Let us run away, lest the house fall upon us while the enemy of truth is in it.'" Is it possible that St. John thought that God would kill two eminent Christians for the purpose of getting even with one heretic? . . .

It is very hard, indeed, to prove what the apostles said, or what the Fathers of the church wrote. There were many centuries filled with forgeries—many generations in which the cunning hands of ecclesiastics erased, obliterated, or interpolated the records of the past—during which they invented books, invented authors, and quoted from works that never existed.

The testimony of the "Fathers" is without the slightest value. They believed everything—they examined nothing. They received as a waste-basket receives. Whoever accepts their testimony will exclaim with the Cardinal: "Happily, men are not saved by logic."

THE PHILOSOPHY OF HERBERT SPENCER

I. COMTE AND DARWIN

The Kantian philosophy, which announced itself as "prolegomena to all future metaphysics," was, by malicious intent, a murderous thrust at traditional modes of speculation; and, contrary to intent, a damaging blow to all metaphysics whatsoever. For metaphysics had meant, throughout the history of thought, an attempt to discover the ultimate nature of reality; now men learned, on the most respectable authority, that reality could never be experienced; that it was a "noumenon," conceivable but not knowable; and that even the subtlest human intelligence could never pass beyond phenomena, could never pierce the veil of Maya. The metaphysical extravagances of Fichte, Hegel and Schelling, with their various readings of the ancient riddle, their Ego and Idea and Will, had canceled one another into zero; and by the eighteen-thirties the universe was generally conceded to have guarded its secret well. After a generation of Absolute intoxication, the mind of Europe reacted by taking a pledge against metaphysics of any kind.

Since the French had made a specialty of scepticism, it was natural that they should produce the founder (if there are such persons in philosophy, where every idea is hallowed with years) of the "positivist" movement. Auguste Comte—or, as his parents called him, Isidore Auguste Marie François Xavier Comte—was born at Montpellier in 1798. The idol of his youth was Benjamin Franklin, whom he called the modern Socrates. "You know that at five-and-twenty he formed the design of becoming perfectly wise. and that he fulfilled his

design. I have dared to undertake the same thing, though I am not yet twenty." He made a fair start by becoming secretary to the great Utopian, Saint-Simon, who passed on to him the reforming enthusiasm of Turgot and Condorcet, and the idea that the social, like physical phenomena, might be reduced to laws and science, and that all philosophy should be focused upon the moral and political improvement of mankind. But, like most of us who set out to reform the world, Comte found it difficult enough to manage his own home; in 1827, after two years of marital infelicity, he suffered a mental break-down, and attempted suicide in the Seine. To his rescuer, therefore, we owe something of the five volumes of *Positive Philosophy* which appeared between 1830 and 1842, and the four volumes of *Positive Polity* which appeared between 1851 and 1854.

This was an undertaking which, in scope and patience, was second in modern times only to Spencer's *Synthetic Philosophy*." Here the sciences were classified according to the decreasing simplicity and generality of their subject-matter: mathematics, astronomy, physics, chemistry, biology, and sociology; each rested on the results of all the sciences before it; therefore sociology was the apex of the sciences, and the others had their reason for existence only in so far as they could provide illumination for the science of society. Science, in the sense of exact knowledge, had spread from one subject-matter to another in the order given; and it was natural that the complex phenomena of social life should be the last to yield to scientific method. In each field of thought the historian of ideas could observe a Law of Three Stages: at first the subject was conceived in the *theological* fashion, and all problems were explained by the will of some deity—

as when the stars were gods, or the chariots of gods; later, the same subject reached the *metaphysical* stage, and was explained by metaphysical abstractions—as when the stars moved in circles because circles were the most perfect figure; finally the subject was reduced to *positive* science by precise observation, hypothesis, and experiment, and its phenomena were explained through the regularities of natural cause and effect. The “Will of God” yields to such airy entities as Plato’s “Ideas” or Hegel’s “Absolute Idea,” and these in turn yield to the laws of science. Metaphysics is a stage of arrested development: the time had come, said Comte, to abandon these puerilities. Philosophy was not something different from science; it was the co-ordination of all the sciences with a view to the improvement of human life.

There was a certain dogmatic intellectualism about this positivism which perhaps reflected the disillusioned and isolated philosopher. When, in 1845, Mme. Clotilde de Vaux (whose husband was spending his life in jail) took charge of Comte’s heart, his affection for her warmed and colored his thought, and led to a reaction in which he placed feeling above intelligence as a reforming force, and concluded that the world could be redeemed only by a new religion, whose function it should be to nourish and strengthen the feeble altruism of human nature by exalting Humanity as the object of a ceremonial worship. Comte spent his old age devising for this Religion of Humanity an intricate system of priesthood, sacraments, prayers, and discipline; and proposed a new calendar in which the names of pagan deities and medieval saints should be replaced by the heroes of human progress. As a wit put it, Comte offered the world all of Catholicism except Christianity.

The positivist movement fell in with the flow of English thought, which took its spirit from a life of industry and trade, and looked up to matters of fact with a certain reverence. The Baconian tradition had turned thought in the direction of things, mind in the direction of matter; the materialism of Hobbes, the sensationalism of Locke, the scepticism of Hume, the utilitarianism of Bentham, were so many variations on the theme of a practical and busy life. Berkeley was an Irish discord in this domestic symphony. Hegel laughed at the English habit of honoring physical and chemical equipment with the name of "philosophical instruments"; but such a term came naturally to men who agreed with Comte and Spencer in defining philosophy as a generalization of the results of all the sciences. So it was that the positivist movement found more adherents in England than in the land of its birth; adherents perhaps not so fervent as the generous Littré, but endowed with that English tenacity which kept John Stuart Mill (1806-73) and Frederick Harrison (1831-1923) faithful all their lives to Comte's philosophy, while their English caution kept them aloof from his ceremonious religion.

Meanwhile the Industrial Revolution, born of a little science, was stimulating science in return. Newton and Herschel had brought the stars to England, Boyle and Davy had opened the treasures of chemistry, Faraday was making the discoveries that would electrify the world, Rumford and Joule were demonstrating the transformability and equivalence of force and the conservation of energy. The sciences were reaching a stage of complexity which would make a bewildered world welcome a synthesis. But above all these intellectual influences that stirred England in the youth of

Herbert Spencer was the growth of biology, and the doctrine of evolution. Science had been exemplarily international in the development of this doctrine: Kant had spoken of the possibility of apes becoming men; Goethe had written of the metamorphosis of plants; Erasmus Darwin and Lamarck had propounded the theory that species had evolved from simpler forms by the inheritance of the effects of use and disuse; and in 1830 St. Hilaire shocked Europe, and gladdened old Goethe, by almost triumphing against Cuvier in that famous debate on evolution which seemed like another *Ernani*, another revolt against classic ideas of changeless rules and orders in a changeless world.

In the eighteen-fifties evolution was in the air. Spencer expressed the idea, long before Darwin, in an essay on "The Development Hypothesis" (1852), and in his *Principles of Psychology* (1855). In 1858 Darwin and Wallace read their famous paper before the Linnaean Society; and in 1859 the old world, as the good bishops thought, crashed to pieces with the publication of the *Origin of Species*. Here was no mere vague notion of evolution, of higher species evolving somehow from lower ones; but a detailed and richly documented theory of the actual mode and process of evolution "by means of natural selection, or the preservation of favored races in the struggle for life." In one decade all the world was talking about evolution. What lifted Spencer to the crest of this wave of thought was the clarity of mind which suggested the application of the evolution idea to every field of study, and the range of mind which brought almost all knowledge to pay tribute to his theory. As mathematics had dominated philosophy in the seventeenth century, giving to the

world Descartes, Hobbes, Spinoza, Leibniz and Pascal; and as psychology had written philosophy in Berkeley and Hume and Condillac and Kant; so in the nineteenth century, in Schelling and Schopenhauer, in Spencer and Nietzsche and Bergson, biology was the background of philosophic thought. In each case the epochal ideas were the piece-meal production of separate men, more or less obscure; but the ideas are attached to the men who coordinated and clarified them, as the New World took the name of Amerigo Vespucci because he drew a map. Herbert Spencer was the Vespucci of the age of Darwin, and something of its Columbus too.

II. THE DEVELOPMENT OF SPENCER

He was born at Derby in 1820. In both lines his ancestors were Non-conformists or Dissenters. His father's mother had been a devoted follower of John Wesley; his father's brother, Thomas, though an Anglican clergyman, led a Wesleyan movement within the Church, never attended a concert or a play, and took an active part in movements for political reform. This drive to heresy became stronger in the father, and culminated in the almost obstinate individualism of Herbert Spencer himself. The father never used the supernatural to explain anything; he was described by one acquaintance (though Herbert considered this an exaggeration) as "without faith or religion whatever, so far as one could see."¹ He was inclined to science, and wrote an *Inventional Geometry*. In politics he was an individualist like his son and "would never take off his hat to anyone, no matter of what

¹Spencer, *Autobiography*, New York, 1904; vol. 1, p. 51.

rank.”² “If he did not understand some question my mother put, he would remain silent; not asking what the question was, and letting it go unanswered. He continued this course all through his life, notwithstanding its futility; there resulted no improvement.”³ One is reminded (except for the silence) of Herbert Spencer’s resistance, in his later years, to the extension of State functions.

The father, as well as an uncle and the paternal grandfather, were teachers of private schools; and yet the son, who was to be the most famous English philosopher of his century, remained till forty an uneducated man. Herbert was lazy, and the father was indulgent. At last, when he was thirteen, Herbert was sent to Hinton to study under his uncle, who had a reputation for severity. But Herbert promptly ran away from the uncle, and trudged all the way back to the paternal home at Derby—48 miles the first day, 47 the next, and 20 the third, all on a little bread and beer. Nevertheless he returned to Hinton after a few weeks, and stayed for three years. It was the only systematic schooling that he ever received. He could not say, later, just what it was he learned there; no history, no natural science, no general literature. He says, with characteristic pride: “That neither in boyhood nor youth did I receive a single lesson in English, and that I have remained entirely without formal knowledge of syntax down to the present hour, are facts which should be known; since their implications are at variance with assumptions universally accepted.”⁴ At the age of forty he tried to read the *Iliad*, but “after reading some six books I felt what a task it would be to go on—felt that I would

²P. 53.³P. 61.⁴P. vii.

rather give a large sum than read to the end."⁵ Collier, one of his secretaries, tells us that Spencer never finished any book of science.⁶ Even in his favorite fields he received no systematic instruction. He burnt his fingers and achieved a few explosions in chemistry; he browsed entomologically among the bugs about school and home; and he learned something about strata and fossils in his later work as a civil engineer; for the rest he picked his science casually as he went along. Until he was thirty he had no thought at all of philosophy.⁷ Then he read Lewes, and tried to pass on to Kant; but finding, at the outset, that Kant considered space and time to be forms of sense-perception rather than objective things, he decided that Kant was a dunce, and threw the book away.⁸ His secretary tells us that Spencer composed his first book, *Social Statics*, "having read no other ethical treatise than an old and now forgotten book by Jonathan Dymond." He wrote his *Psychology* after reading only Hume, Mansel and Reid; his *Biology* after reading only Carpenter's *Comparative Physiology* (and not the *Origin of Species*); his *Sociology* without reading Comte or Tylor; his *Ethics* without reading Kant or Mill or any other moralist than Sedgwick.⁹ What a contrast to the intensive and relentless education of John Stuart Mill!

Where, then, did he find those myriad facts with which he propped up his thousand arguments? He "picked them up," for the most part, by direct observation rather than by reading. "His curiosity was ever awake, and he

⁵P. 300.

⁹Collier, in Royce, 210f.

was continually directing the attention of his companion to some notable phenomenon . . . until then seen by his eyes alone." At the Athenaeum Club he pumped Huxley and his other friends almost dry of their expert knowledge; and he ran through the periodicals at the Club as he had run through those that passed through his father's hands for the Philosophical Society at Derby, "lynx-eyed for every fact that was grist to his mill."¹⁰ Having determined what he wanted to do, and having found the central idea, evolution, about which all his work would turn, his brain became a magnet for relevant material, and the unprecedented orderliness of his thought classified the material almost automatically as it came. No wonder the proletaire and the business man heard him gladly; here was just such a mind as their own—a stranger to book-learning, innocent of "culture," and yet endowed with the natural, matter-of-fact knowledge of the man who learns as he works and lives.

For he was working for his living; and his profession intensified the practical tendency of his thought. He was surveyor, supervisor and designer of railway lines and bridges, and in general an engineer. He dripped inventions at every turn; they all failed, but he looked back upon them, in his *Autobiography*, with the fondness of a father for a wayward son; he sprinkled his reminiscient pages with patent salt-cellars, jugs, candle-extinguishers, invalid-chairs, and the like. As most of us do in youth, he invented new diets too; for a time he was vegetarian; but he abandoned it when he saw a fellow-vegetarian develop anemia, and himself losing strength; "I found that I had to rewrite what I had written dur-

¹⁰*Ibid.*

ing the time I was a vegetarian, because it was so wanting in vigor."¹¹ He was ready in those days to give everything a trial; he even thought of migrating to New Zealand, forgetting that a young country has no use for philosophers. It was characteristic of him that he made parallel lists of reasons for and against the move, giving each reason a numerical value. The sums being 110 points for remaining in England and 301 for going, he remained.

His character had the defects of its virtues. He paid for his resolute realism and practical sense by missing the spirit and zest of poetry and art. The only poetical touch in his twenty volumes was due to a printer who made Spencer speak of "the daily versification of scientific predictions." He had a fine persistence whose other side was an opinionated obstinacy; he could sweep the entire universe for proofs of his hypotheses, but he could not see with any insight another's point of view; he had the egotism that bears up the non-conformer, and he could not carry his greatness without some conceit. He had the limitations of the Pioneers: a dogmatic narrowness accompanying a courageous candor and an intense originality; sternly resisting all flattery, rejecting proffered governmental honors, and pursuing his painful work for forty years in chronic ill-health and modest seclusion; and yet marked, by some phrenologist who gained access to him—"Self-esteem very large."¹² The son and grandson of teachers, he wielded the ferule in his books, and struck a high didactic tone. "I am never puzzled," he tells us.¹³ His solitary bachelor life left him lacking in the warmly human qualities, though he

¹¹*Autob.*, i, 401. "*Post hoc propter hoc*"?

¹²P. 228. ¹³P. 464.

could be indignantly humane. He had an affair with that great Englishman, George Eliot, but she had too much intellect to please him.¹⁴ He lacked humor, and had no subtlety or nuances in his style. When he lost at his favorite game of billiards, he denounced his opponent for devoting so much time to such a game as to have become an expert in it. In his *Autobiography* he writes reviews of his own early books, to show how it should have been done.¹⁵

Apparently the magnitude of his task compelled him to look upon life with more seriousness than it deserves. "I was at the *Fête* of St. Cloud on Sunday," he writes from Paris; "and was much amused by the juvenility of the adults. The French never entirely cease to be boys; I saw grey-haired people riding on whirligigs such as we have at our own fairs."¹⁶ He was so busy analyzing and describing life that he had no time to live it. After seeing Niagara Falls he jotted down in his diary: "Much what I had expected."¹⁷ He describes the most ordinary incidents with the most magnificent pedantry—as when he tells us of the only time he ever swore.¹⁸ He suffered no crises, felt no romance (if his memoirs record him well); he had some intimacies but he writes of them almost mathematically, plotting the curves of his tepid friendships without any uplifting touch of passion. A friend said of himself that he could not write well when dictating to a young woman stenographer; Spencer said that it did not bother him at all. His secretary says, "The passionless thin lips

¹⁴I, 457-62; II, 44, 151, 415, 540.

¹⁶I, 533. ¹⁷II, 465.

¹⁸"Tyndall once said of him what a much better fellow he would be if he had a good swear now and again,"—Elliott, *Herbert Spencer*, p. 61.

told of a total lack of sensuality, and the light eyes betrayed a lack of emotional depth."¹⁹ Hence the monotonous levelness of his style: he never soars, and needs no exclamation-points; in a romantic century he stands like a sculptured lesson in dignity and reserve.

He had an exceptionally logical mind; he marshalled his *a prioris* and his *a posterioris* with the precision of a chess player. He is the clearest expositor of complex subjects that modern history can show; he wrote of difficult problems in terms so lucid that for a generation all the world was interested in philosophy. "It has been remarked," he says, "that I have an unusual faculty of exposition—set forth my data and reasonings and conclusions with a clearness and coherence not common."²⁰ He loved spacious generalizations, and made his works interesting rather with his hypotheses than with his proofs. Huxley said that Spencer's idea of a tragedy was a theory killed by a fact;²¹ and there were so many theories in Spencer's mind that he was bound to have a tragedy every day or two. Huxley, struck by the feeble and undecided gait of Buckle, said of him to Spencer: "Ah, I see the kind of man: he is top-heavy." "Buckle," Spencer adds, "had taken in a much larger quantity of matter than he could organize."²² With Spencer it was the other way; he organized much more than he had taken in. He was all for co-ordination and synthesis; he depreciated Carlyle for lacking a similar turn. The fondness for order became in him an enslaving passion; a brilliant generalization overmastered him. But the world was calling for a mind like his; one who could transform the wilderness of facts with sunlit clarity into

¹⁹Royce, 188. ²⁰Autob., ii, 511.

²¹I, 467. ²²II, 4.

civilized meaning; and the service which Spencer performed for his generation entitled him to the failings that made him human. If he has been pictured here rather frankly, it is because we love a great man better when we know his faults, and suspiciously dislike him when he shines in unmitigated perfection.

"Up to this date," wrote Spencer at forty, "my life might fitly have been characterized as miscellaneous."²³ Seldom has a philosopher's career shown such desultory vacillation. "About this time" (age twenty-three) "my attention turned to the construction of matches."²⁴ But gradually he found his field, and tilled it with honest husbandry. As early as 1842 he wrote, for the *Non-conformist* (note the medium he chose), some letters on "The Proper Sphere of Government," which contained his later *laissez-faire* philosophy *in ovo*. Six years later he dropped engineering to edit *The Economist*. At the age of thirty, when he spoke disparagingly of Jonathan Dymond's *Essays on the Principles of Morality*, and his father challenged him to do as well with such a subject, he took the dare, and wrote his *Social Statics*. It had only a small sale, but it won him access to the magazines. In 1852 his essay on "The Theory of Population" (one of the many instances of Malthus' influence on the thought of the nineteenth century) suggested that the struggle for existence leads to a survival of the fittest, and coined those historic phrases. In the same year his essay on "The Development Hypothesis" met the trite objection—that the origin of new species by progressive modification of older ones had never been seen—by pointing out that the same argument told much more strongly

²³II, 67. ²⁴I, 279.

against the theory of the "special creation" of new species by God; and it went on to show that the development of new species was no more marvelous or incredible than the development of a man from ovum and sperm, or of a plant from a seed. In 1855 his second book, *The Principles of Psychology*, undertook to trace the evolution of mind. Then, in 1857, came an essay on "Progress, Its Law and Cause," which took up Von Baer's idea of the growth of all living forms from homogeneous beginnings to heterogeneous developments, and lifted it into a general principle of history and progress. In short Spencer had grown with the spirit of his age, and was ready now to become the philosopher of universal evolution.

When, in 1858, he was revising his essays for collective publication, he was struck by the unity and sequence of the ideas he had expressed; and the notion came to him, like a burst of sunlight through opened doors, that the theory of evolution might be applied in every science as well as in biology; that it could explain not only species and genera but planets and strata, social and political history, moral and esthetic conceptions. He was fired with the thought of a series of works in which he would show the evolution of matter and mind from nebula to man, and from savage to Shakespeare. But he almost despaired when he thought of his nearly forty years. How could one man, so old, and an invalid, traverse all the sphere of human knowledge before his death? Only three years back he had had a complete break-down; for eighteen months he had been incapacitated, broken in mind and courage, wandering aimlessly and hopelessly from place to place. The consciousness of his latent powers made his weakness a bitter thing to him. He knew that he would never be quite

healthy again, and that he could not bear mental work for more than an hour at a time. Never was a man so handicapped for the work he chose, and never did a man choose, so late in life, so great a work.

He was poor. He had never given much thought to getting a living. "I don't mean to get on," he said; "I don't think getting on is worth the bother."²⁵ He had resigned the editorship of *The Economist* on receiving \$2,500 as bequest from an uncle; but his idleness had consumed this gift. It occurred to him now that he might seek advance subscriptions for his intended volumes, and so live from hand to mouth, and pay his way as he went. He prepared an outline, and submitted it to Huxley, Lewes, and other friends; they secured him an imposing list of initial subscribers whose names might adorn his prospectus: Kingsley, Lyell, Hooker, Tyndall, Buckle, Froude, Bain, Herschel, and others. Published in 1860, this prospectus brought 440 subscriptions from Europe, and 200 from America; the total promising a modest \$1,500 a year. Spencer was satisfied, and set to work with a will.

But after the publication of *First Principles*, in 1862, many subscribers withdrew their names because of the famous first part, which, attempting to reconcile science and religion, offended bishops and pundits alike. The way of the peacemaker is hard. *First Principles* and *The Origin of Species* became the center of a great Battle of the Books, in which Huxley served as generalissimo for the forces of Darwinism and agnosticism. For a time the evolutionists were severely ostracised by respectable people; they were denounced as immoral monsters, and it was thought good form to insult

²⁵J. A. Thomson, *Herbert Spencer*, p. 71.

them publicly. Spencer's subscribers fell away with every instalment, and many defaulted on payments due for instalments received. Spencer went on as long as he could, paying out of his pocket the deficit which every issue involved. At last his funds and his courage were exhausted, and he issued to the remaining subscribers an announcement that he could no longer continue his work.

Then came one of the encouraging incidents of history. Spencer's greatest rival, who had held the field of English philosophy before the publication of *First Principles*, and now saw himself superseded by the philosopher of evolution, wrote to Spencer as follows, on February 4, 1866:

"Dear Sir:

On arriving here last week, I found the December livraison of your *Biology*, and I need hardly say how much I regretted the announcement in the paper annexed to it. . . . I propose that you should write the next of your treatises, and that I should guarantee the publisher against loss. . . . I beg that you will not consider this proposal in the light of a personal favor, though even if it were I should still hope to be permitted to offer it. But it is nothing of the kind—it is a simple proposal of co-operation for an important public purpose, for which you give your labor and have given your health. I am, Dear Sir,

Very truly yours,

J. S. Mill."²⁶

Spencer courteously refused; but Mill went out among his friends and persuaded several of them to subscribe for 250 copies each. Spencer again objected, and could not be moved. Then

²⁶*Autob.*, ii, 156.

suddenly came a letter from Prof. Youmans, saying that Spencer's American admirers had bought, in his name, \$7,000 of public securities, of which the interest or dividends were to go to him. This time he yielded. The spirit of the gift renewed his inspiration; he resumed his task, and for forty years he kept his shoulder to the wheel, until all the Synthetic Philosophy had arrived safely into print. This triumph of mind and will over illness and a thousand obstacles is one of the sunny spots in the book of man.

III. FIRST PRINCIPLES

1. THE UNKNOWNABLE

"We too often forget," says Spencer, at the outset, "that not only is there 'a soul of goodness in things evil,' but generally also a soul of truth in things erroneous." He proposes, therefore, to examine religious ideas, with a view to finding that core of truth which under the changing form of many faiths, has given to religion its persistent power over the human soul.

What he finds at once is that every theory of the origin of the universe drives us into inconceivabilities. The atheist tries to think of a self-existent world, uncaused and without beginning; but we cannot conceive of anything beginningless or uncaused. The theist merely puts back the difficulty by a step; and to the theologian who says, "God made the world," the child's unanswerable query comes, "Who made God?" All ultimate religious ideas are logically inconceivable.

All ultimate scientific ideas are equally beyond rational conception. What is matter? We reduce it to atoms, and then find ourselves forced to divide the atom as we had divided

the molecule; we are driven into the dilemma that matter is infinitely divisible,—which is inconceivable; or that there is a limit to its divisibility,—which also is inconceivable. So with the divisibility of space and time; both of these are ultimately irrational ideas. Motion is wrapped in a triple obscurity, since it involves matter changing, in time, its position in space. When we analyze matter resolutely we find nothing at last but force—a force impressed upon our organs of sense, or a force resisting our organs of action; and who shall tell us what force is? Turn from physics to psychology, and we come upon mind and consciousness: and here are greater puzzles than before. “Ultimate scientific ideas,” then, “are all representations of realities that cannot be comprehended. . . . In all directions the scientist’s investigations bring him face to face with an insoluble enigma; and he ever more clearly perceives it to be an insoluble enigma. He learns at once the greatness and the littleness of the human intellect—its power in dealing with all that comes within the range of experience, its impotence in dealing with all that transcends experience. He, more than any other, truly *knows* that in its ultimate nature nothing can be known.”²⁷ The only honest philosophy, to use Huxley’s word, is agnosticism.

The common cause of these obscurities is the relativity of all knowledge. “Thinking being relating, no thought can express more than relations. . . . Intellect being framed simply by and for converse with phenomena, involves us in nonsense when we try to use it for anything beyond phenomena.”²⁸ And yet the rela-

²⁷*First Principles*, New York, 1910; p. 56.

²⁸Pp. 107-108. This unconsciously follows Kant and succinctly anticipates Bergson.

tive and phenomenal imply, by their names and natures, something beyond them, something ultimate and absolute. "On watching our thoughts we see how impossible it is to get rid of the consciousness of an Actuality lying behind Appearances, and how from this impossibility results our indestructible belief in that Actuality."²⁹ But what that Actuality is we cannot know.

From this point of view the reconciliation of science and religion is no longer very difficult. "Truth generally lies in the co-ordination of antagonistic opinions."³⁰ Let science admit that its "laws" apply only to phenomena and the relative; let religion admit that its theology is a rationalizing myth for a belief that defines conception. Let religion cease to picture the Absolute as a magnified man; much worse, as a cruel and blood-thirsty and treacherous monster, afflicted with "a love of adulation such as would be despised in a human being."³¹ Let science cease to deny deity, or to take materialism for granted. Mind and matter are, equally, relative phenomena, the double effect of an ultimate cause whose nature must remain unknown. The recognition of this Inscrutable Power is the core of truth in every religion, and the beginning of all philosophy.

2. EVOLUTION

Having indicated the unknowable, philosophy surrenders it, and turns its face to what can be known. Metaphysics is a mirage; as Michelet put it, it is "the art of befuddling one's self methodically." The proper field and function of philosophy lies in the summation and unification of the results of science. "Knowledge of the lowest kind is un-unified

²⁹P. 83. ³⁰*Autob.*, ii, 16. ³¹*F.P.*, 103.

knowledge; science is partially-unified knowledge; philosophy is completely-unified knowledge."³² Such complete unification requires a broad and universal principle that will include all experience, and will describe the essential features of all knowledge. Is there a principle of this kind?

We may perhaps approach such a principle by trying to unify the highest generalizations of physics. These are the indestructibility of matter, the conservation of energy, the continuity of motion, the persistence of relations among forces (i. e., the inviolability of natural law), the transformability and equivalence of forces (even of mental and physical forces), and the rhythm of motion. This last generalization, not usually recognized, needs only to be pointed out. All nature is rhythmical, from the pulsations of heat to the vibrations of violin strings; from the undulations of light, heat and sound to the tides of the sea; from the periodicities of sex to the periodicities of planets and comets and stars; from the alternation of night and day to the succession of the seasons, and perhaps to the rhythms of climatic change; from the oscillations of molecules to the rise and fall of nations and the birth and death of stars.

All these "laws of the knowable" are reducible (by an analysis which must not here be followed in detail) to the final law of the persistence of force. But there is something static and inert about this principle; it does not so much as hint at the secret of life. What is the dynamic principle of reality? What is the formula of the growth and decay of all things? It must be a formula of evolution and dissolution, for "an entire history of anything must include its appearance out of the

³²P. 119.

imperceptible and its disappearance into the imperceptible."³³

So Spencer offers us his famous formula of evolution, which made the intellect of Europe gasp for breath, and required ten volumes and forty years for its explanation. "Evolution is an integration of matter and a concomitant dissipation of motion; during which the matter passes from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity; and during which the retained motion undergoes a parallel transformation."³⁴ What does this mean?

The growth of planets out of nebulae; the formation of oceans and mountains on the earth; the metabolism of elements by plants, and of animal tissues by men; the development of the heart in the embryo, and the fusion of bones after birth; the unification of sensations and memories into knowledge and thought, and of knowledge into science and philosophy; the development of families into clans and gentes and cities and states and alliances and the "federation of the world": here is the integration of matter,—the aggregation of separate items into masses and groups and wholes. Such integration of course involves a lessening of motion in the parts, as the growing power of the state lessens the freedom of the individual; but at the same time it gives to the parts an interdependence, a protective tissue of relationships, which constitutes "coherence" and promotes corporate survival. The process brings, too, a greater definiteness of forms and functions: the nebula is shapeless, nebulous; and yet out of it come the elliptical regularity of the planets, the sharp lines of mountain-chains, the specific form and char-

³³P. 253. ³⁴P. 367.

acter of organisms and organs, the division of labor and specialization of function in physiological and political structures, etc. And the parts of this integrating whole become not merely definite but diverse, heterogeneous in nature and operation. The primeval nebula is homogeneous—i. e., it consists of parts that are alike; but soon it is differentiated into gases and liquids and solids; the earth becomes here green with grass, there white with mountain-tops, or blue with the multitudinous sea; evolving life begets, out of a relatively homogeneous protoplasm, the varied organs of nutrition, reproduction, locomotion, and perception; a simple language fills whole continents with its multiplying dialects; a single science breeds a hundred, and the folk-lore of a nation flowers into a thousand forms of literary art; individuality grows, character stands out uniquely, and every race and people develops its peculiar genius. Integration and heterogeneity, aggregation of parts into ever larger wholes and differentiation of parts into ever more varied forms: these are the foci of the orbit of evolution. Whatever passes from diffusion to integration and unity, and from a homogeneous simplicity to a differentiated complexity (cf. America, 1600-1900), is in the flow of evolution; whatever is returning from integration to diffusion, and from complexity to simplicity (cf. Europe 200-600 A. D.), is caught in the ebb of dissolution.

Not content with this synthetic formula, Spencer endeavors to show how it follows by inevitable necessity from the natural operation of mechanical forces. There is, first, a certain "Instability of the Homogeneous": i. e., similar parts cannot long remain similar because they are unevenly subject to external forces, outer parts, e. g., are sooner attacked, like coast-line

towns in war; and the variety of occupations moulds similar men into the varied embodiments of a hundred varied professions and trades. There is, again, a "Multiplication of Effects": one cause may produce a vast variety of results, and help to differentiate the world; a word amiss, like Marie Antoinette's, or an altered telegram at Ems, or a wind at Salamis, may play an endless role in history. And there is the law of "Segregation": the parts of a relatively homogeneous whole, being driven separate into different areas, are moulded by diverse environments into dissimilar products,—as the English become Americans, or Canadians, or Australians, according to the genius of the place. In these many ways the forces of nature build the variety of this evolving world.

But finally, and inescapably, comes "Equilibration." Every motion, being motion under resistance, must sooner or later come to an end; every rhythmic oscillation (unless externally reinforced) suffers some loss of rate and amplitude. The planets ride through a lesser orbit, or will ride, than once they rode: the sun will shine less warmly and brightly as the centuries pass away; the friction of the tides will retard the rotation of the earth. This globe, that throbs and murmurs with a million motions, and luxuriates into a million forms of riotously breeding life, will some day move more leisurely in its orbit and its parts; the blood will run cooler and more slowly in our dessicated veins; we shall not hurry any more; like dying races, we shall think of heaven in terms of rest and not of life; we shall dream of Nirvana. Gradually, and then rapidly, equilibration will become dissolution, the unhappy epilogue of evolution. Societies will disintegrate, masses will migrate, cities will fade into the dark hinterland of peasant life; no

government will be strong enough to hold the loosened parts together; social order will cease to be even remembered. And in the individual too, integration will give way to disruption; and that co-ordination which is life will pass into that diffuse disorder which is death. The earth will be a chaotic theatre of decay, a gloomy drama of energy in irreversible degradation. The earth itself will be resolved into the dust and nebula from which it came. The cycle of evolution and dissolution will be complete. The cycle will begin again, and endless times again; but always this will be the dénouement. *Memento mori* is written upon the face of life; and every birth is a prelude to decay and death.

IV. BIOLOGY: THE EVOLUTION OF LIFE

The second and third volumes of the Synthetic Philosophy appeared in 1872 under the title of *Principles of Biology*. They revealed the natural limitations of a philosopher invading a specialist's field; but they atoned for errors of detail by illuminating generalizations that gave a new unity and intelligibility to vast areas of biological fact.

Spencer begins with a famous definition: "Life is the continuous adjustment of internal relations to external relations."³⁵ The completeness of life depends on the completeness of this correspondence; and life is perfect when the correspondence is perfect. The correspondence is not a merely passive adaptation; what distinguishes life is the adjustment of internal relations in anticipation of a change in external relations, as when an animal crouches to avoid a blow, or a man makes a fire to warm his food. The defect of the definition lies not mere-

³⁵*Principles of Biology*; New York, 1910; i, 99.

ly in its tendency to neglect the remoulding activity of the organism upon the environment, but in its failure to explain what is that subtle power whereby an organism is enabled to make these prophetic adjustments that characterize vitality. In a chapter added to later editions, Spencer was forced to discuss "The Dynamic Element in Life," and to admit that his definition had not really revealed the nature of life. "We are obliged to confess that Life in its essence cannot be conceived in physico-chemical terms."³⁶ He did not realize how damaging such an admission was to the unity and completeness of his system.

As Spencer sees in the life of the individual an adjustment of internal to external relations, so he sees in the life of the species a remarkable adjustment of reproductive fertility to the conditions of its habitat. Reproduction arises originally as a readaptation of the nutritive surface to the nourished mass; the growth of an amoeba, for example, involves an increase of mass much more rapid than the increase in the surface through which the mass must get its nourishment. Division, budding, spore-formation, and sexual reproduction have this in common, that the ratio of mass to surface is reduced, and the nutritive balance is restored. Hence the growth of the individual organism beyond a certain point is dangerous; and normally growth gives way, after a time, to reproduction. On the average, growth varies inversely with the rate of energy-expenditure; and the rate of reproduction varies inversely with the degree of growth. "It is well known to breeders that if a filly is allowed to bear a foal, she is thereby prevented from reaching her proper size. . . . As a converse fact, cas-

³⁶I, 120.

trated animals, as capons and notably cats, often become larger than their unmutilated associates."³⁷ The rate of reproduction tends to fall as the development and capability of the individual progress. "When, from lowness of organization, the ability to contend with external dangers is small, there must be great fertility to compensate for the consequent mortality; otherwise the race must die out. When, on the contrary, high endowments give much capacity for self-preservation, a correspondingly low degree of fertility is requisite," lest the rate of multiplication should outrun the supply of food.³⁸ In general, then, there is an opposition of individuation and genesis, of individual development and fertility. The rule holds for groups and species more regularly than for individuals: the more highly developed the species or the group, the lower will its birth-rate be. But it holds for individuals too, on the average. For example, intellectual development seems hostile to fertility. "Where exceptional fertility exists, there is sluggishness of mind, and where there has been, during education, excessive expenditure in mental action, there frequently follows a complete or partial infertility. Hence the particular kind of further evolution which Man is hereafter to undergo, is one which, more than any other, may be expected to cause a decline in his power of reproduction."³⁹ Philosophers are notorious for shirking parentage. In woman, on the other hand, the arrival of motherhood normally brings a diminution of intellectual activity;⁴⁰ and perhaps her shorter adolescence is due to her earlier sacrifice to reproduction.

Despite this approximate adaptation of birth-

³⁷II, 459. ³⁸II, 421. ³⁹II, 530. ⁴⁰*Autob.*, i, 62.

rate to the needs of group survival, the adaptation is never complete, and Malthus was right in his general principle that population tends to outrun the means of subsistence. "From the beginning this pressure of population has been the proximate cause of progress. It produced the original diffusion of the race. It compelled men to abandon predatory habits and take to agriculture. It led to the clearing of the earth's surface. It forced men into the social state, . . . and developed the social sentiments. It has stimulated to progressive improvements in production, and to increased skill and intelligence."⁴¹ It is the chief cause of that struggle for existence through which the fittest are enabled to survive, and through which the level of the race is raised.

Whether the arrival of the fittest is due chiefly to spontaneous favorable variations, or to the partial inheritance of characters or capacities repeatedly acquired by successive generations, is a question on which Spencer took no dogmatic stand; he accepted Darwin's theory gladly, but felt that there were facts which it could not explain, and which compelled a modified acceptance of Lamarckian views. He defended Lamarck with fine vigor in his controversy with Weismann, and pointed out certain defects in the Darwinian theory. In those days Spencer stood almost alone on the side of Lamarck; it is of some interest to note that today the neo-Lamarckians include descendants of Darwin, while the greatest contemporary English biologist gives it as the view of present-day students of genetics that Darwin's *particular* theory (not, of course the general theory) of evolu-

⁴¹*Biology*, ii, 536.

tion must be abandoned.⁴² But let us not rush in where experts fear to tread.

V. PSYCHOLOGY: THE EVOLUTION OF MIND

The two volumes on *The Principles of Psychology* (1873) are the weakest links in Spencer's chain. There had been an earlier volume on the subject (1855), a youthfully vigorous defense of materialism and determinism; but age and thought revised this into a milder form, and padded it out with hundreds of pages of painstaking but unilluminating analysis. Here, even more than elsewhere, Spencer is rich in theories and poor in proofs. He has a theory of the origin of nerves out of intercellular connective tissue; and a theory of the genesis of instinct by the compounding of reflexes and the transmission of acquired characters; and a theory of the origin of mental categories out of the experience of the race; and a theory of "transfigured realism";⁴³ and a hundred other theories that have all the obfuscating power of metaphysics rather than the clarifying virtue of a matter-of-fact psychology. In these volumes we leave realistic England and go "back to Kant."

What strikes us at once is that for the first time in the history of psychology, we get here a resolutely evolutionist point of view, an attempt at genetic explanations, an effort to trace the bewildering complexities of thought down

⁴²Cf., address of Sir Wm. Bateson before the American Association for the Advancement of Science (Toronto, Dec. 28, 1921), in *Science*, Jan. 20, 1922.

⁴³Spencer means by this that although the objects of experience may very well be transfigured by perception, and be quite other than they seem, they have an existence which does not all depend upon perceiving them.—II, 494.

to the simplest of nervous operations, and finally to the motions of matter. It is true that this effort fails; but who has ever succeeded in such an attempt? Spencer sets out with a magnificent program for the unveiling of the processes whereby consciousness has been evolved; in the end he is compelled to posit consciousness everywhere,⁴¹ in order to evolve it. He insists that there has been one continuous evolution from nebula to mind, and at last confesses that matter is known only through mind. Perhaps the most significant paragraphs in these volumes are those in which the materialist philosophy is abandoned:

"Can the oscillation of a molecule be represented in consciousness side by side with a nervous shock, and the two be recognized as one? No effort enables us to assimilate them. That a unit of feeling has nothing in common with a unit of motion, becomes more than ever manifest when we bring the two into juxtaposition. And the immediate verdict of consciousness thus given, might be analytically justified; . . . for it might be shown that the conception of an oscillating molecule is built out of many units of feeling" (i. e., our knowledge of matter is built up out of units of mind—sensations and memories and ideas). ". . . Were we compelled to choose between the alternatives of translating mental phenomena into physical phenomena, or of translating physical phenomena into mental phenomena, the latter alternative would seem the more acceptable of the two."⁴⁵

⁴¹*Autob.*, ii, 549.

⁴⁵*Principles of Psychology*, New York, 1910; i, 158-9.

Nevertheless there is of course an evolution of mind; a development of modes of response from simple to compound to complex, from reflex to tropism to instinct, through memory and imagination to intellect and reason. To the reader who can pass alive through these 1400 pages of physiological and psychological analysis there will come an overwhelming sense of the continuity of life and the continuity of mind; he will see, as on a retarded cinematograph, the formation of nerves, the development of adaptive reflexes and instincts, and the production of consciousness and thought through the clash of conflicting impulses. "Intelligence has neither distinct grades nor is it constituted by faculties that are truly independent, but its highest manifestations are the effects of a complication that has arisen by insensible steps out of the simplest elements."⁴⁶ There is no hiatus between instinct and reason; each is an adjustment of inner relations to outer relations, and the only difference is one of degree, in so far as the relations responded to by instinct are comparatively stereotyped and simple, while those met by reason are comparatively novel and complex. A rational action is simply an instinctive response which has survived in a struggle with other instinctive responses aroused by a situation; "deliberation" is merely the internecine strife of rival impulses.⁴⁷ At bottom, reason and instinct, mind and life, are one.

Will is an abstract term which we give to the sum of our active impulses, and a volition is the natural flow of an unimpeded idea into action.⁴⁸ An idea is the first stage of an action, an action is the last stage of an idea.

⁴⁶I, 388. ⁴⁷I, 453-5. ⁴⁸I, 496-7.

Similarly, an emotion is the first stage of an instinctive action, and the expression of the emotion is a useful prelude to the completed response; the baring of the teeth in anger gives a substantial hint of that tearing of the enemy to pieces which used to be the natural termination of such a beginning.⁴⁹ "Forms of thought" like the perception of space and time, or the notions of quantity and cause, which Kant supposed innate, are merely instinctive ways of thinking; and as instincts are habits acquired by the race but native to the individual, so these categories are mental habits slowly acquired in the course of evolution, and now part of our intellectual heritage.⁵⁰ All these age-long puzzles of psychology can be explained by "the inheritance of continually-accumulating modifications."⁵¹ It is of course just this all-pervading assumption that makes so much of these laborious volumes questionable, and perhaps vain.

VI. SOCIOLOGY: THE EVOLUTION OF SOCIETY

With sociology the verdict is quite different. These volumes, whose publication ranged over twenty years, are Spencer's masterpiece; they cover his favorite field, and show him at his best in suggestive generalization and political philosophy. From his first book, *Social Statics*, to the last fascicle of *The Principles of Sociology*, over a stretch of almost half a century, his interest was predominantly in the problems of economics and government; he begins and ends, like Plato, with discourses on moral and political justice. No man, not even Comte, founder of the science and maker of the word, has done so much for sociology.

⁴⁹I, 482f; ii, 540f. ⁵⁰I, 466. ⁵¹I, 491.

In a popular introductory volume, *The Study of Sociology* (1873), Spencer argued eloquently for the recognition and development of the new science. If determinism is correct in psychology, there must be regularities of cause and effect in social phenomena; and a thorough student of man and society will not be content with a merely chronological history, like Livy's, nor with a biological history like Carlyle's; he will look, in human history, for those general lines of development, those causal sequences, those illuminating correlations, which transform the wilderness of facts into the chart of science. What biography is to anthropology, history is to sociology.⁵² Of course there are a thousand obstacles that the study of society must yet overcome before it can deserve the name of science.⁵³ The young study is harassed by a multitude of prejudices—personal, educational, theological, economic, political, national, religious; and by the hasty omniscience of the uninformed. "There is a story of a Frenchman who, having been three weeks here, proposed to write a book on England; who, after three months, found that he was not quite ready; and who, after three years, concluded that he knew nothing about it."⁵⁴ Such a man was ripe to *begin* the study of sociology. Men prepare themselves with life-long study before becoming authorities in physics or chemistry or biology; but in the field of social and political affairs every grocer's boy is an expert, knows the solution, and demands to be heard.

⁵²*The Study of Sociology*, New York, 1910; p. 52.

⁵³*The Principles of Ethics*, New York, 1910; i, 464. If Spencer's critics had read this passage they would not have accused him of over-rating sociology.

⁵⁴*Study*, 91.

Spencer's own preparation, in this case, was a model of intellectual conscience. He employed three secretaries to gather data for him, and to classify the data in parallel columns giving the domestic, ecclesiastical, professional, political, and industrial institutions of every significant people. At his own expense he published these collections in eight large volumes, so that other students might verify or modify his conclusions; and the publication being unfinished at his death, he left part of his little savings to complete the undertaking. After seven years of such preparation, the first volume of the *Sociology* appeared in 1876; not until 1896 was the last one ready. When everything else of Spencer's has become a task for the antiquarian, these three volumes will still be rich in reward for every student of society.

Nevertheless, the initial conception of the work is typical of Spencer's habit of rushing into generalizations. Society, he believes, is an organism, having organs of nutrition, circulation, co-ordination and reproduction,⁵⁵ very much as in the case of individuals. It is true that in the individual, consciousness is localized, while in society each of the parts retains its own consciousness and its own will; but the centralization of government and authority tend to reduce the scope of this distinction. "A social organism is like an individual organism in these essential traits: that it grows; that while growing it becomes more complex; that while becoming more complex, its parts acquire increasing mutual dependence; and that its life is immense in length compared with the lives of its component units; . . .

⁵⁵Cf. budding with colonization, and sexual reproduction with the intermarriage of races.

that in both cases there is increasing integration accompanied by increasing heterogeneity."⁵⁶ Thus the development of society liberally carries out the formula of evolution: the growing size of the political unit, from family to state and league, the growing size of the economic unit, from petty domestic industry to monopolies and cartels, the growing size of the population unit, from villages to towns and cities—surely these show a process of integration; while the division of labor, the multiplication of professions and trades, and the growing economic interdependence of city with country, and of nation with nation, amply illustrate the development of coherence and differentiation.

The same principle of the integration of the heterogeneous applies to every field of social phenomena, from religion and government to science and art. Religion is at first the worship of a multitude of gods and spirits, more or less alike in every nation; and the development of religion comes through the notion of a central and omnipotent deity subordinating the others, and co-ordinating them into their hierarchy of special roles. The first gods were probably suggested by dreams and ghosts.⁵⁷ The word *spirit* was, and is, applied equally to ghosts and gods. The primitive mind believed that in death, or sleep, or trance, the ghost or spirit left the body; even in a sneeze the forces of expiration might expel the spirit, so that a protective "God bless you!"—or its equivalent—became attached to this dangerous adventure. Echoes and reflections were sounds and sights of one's ghost or double; the Basuto refuses to walk by a stream, lest a croco-

⁵⁶*Autob.*, ii, 56.

⁵⁷*Principles of Sociology*, New York, 1910; i, 286.

dile should seize his shadow and consume it. God was, at first, only "a permanently existing ghost."⁵⁸ Persons who had been powerful during their earthly lives were believed to keep their power in their ghostly appearance. Among the Tannese the word for god means, literally, a dead man.⁵⁹ "Jehovah" meant "the strong one," "the warrior"; he had been a local potentate, perhaps, who was worshipped after his death as the "god of hosts." Such dangerous ghosts had to be propitiated: funeral rites grew into worship, and all the modes of currying favor with the earthly chief were applied to the ceremonial of prayer and the appeasement of the gods. Ecclesiastical revenues originated in gifts to the gods, just as state revenues began as presents to the chief. Obeisances to kings became prostration and prayer at the altar of the god. The derivation of the god from the dead king shows clearly in the case of the Romans, who deified rulers before their death. In such ancestor-worship all religion seems to have its origin. The power of this custom may be illustrated by the story of the chief who refused baptism because he was not satisfied with the answer to his query as to whether he would meet his (unbaptized) ancestors in heaven.⁶⁰ (Something of this belief entered into the bravery of the Japanese in the war of 1905; death was made easier for them by the thought that their ancestors were looking down upon them from the skies.)

Religion is probably the central feature in the life of primitive men; existence is so pre-

⁵⁸I, 296. ⁵⁹I, 303.

⁶⁰I, 284, 422; *Encycl. Britt.*, art. "Ancestor-worship."

carious and humble among them that the soul lives rather in the hope of things to come than in the reality of things seen. In some measure, supernatural religion is a concomitant of militarist societies; as war gives way to industry, thought turns from death to life, and life runs out of the grooves of reverent authority into the open road of initiative and freedom. Indeed, the most far-reaching change that has taken place in all the history of western society is the gradual replacement of a military by an industrial regime. Students of the state habitually classify societies according as their governments are monarchical, aristocratic, or democratic; but these are superficial distinctions; the great dividing line is that which separates militant from industrial societies, nations that live by war from those that live by work.

The military state is always centralized in government, and almost always monarchical; the co-operation it inculcates is regimental and compulsory; it encourages authoritarian religion, worshipping a warrior god; it develops rigid class distinctions and class codes; it props up the natural domestic absolutism of the male. Because the death rate in warlike societies is high, they tend to polygamy and a low status of women. Most states have been militant because war strengthens the central power and makes for the subordination of all interests to those of the state. Hence "history is little more than the Newgate calendar of nations," a record of robbery, treachery, murder and national suicide. Cannibalism is the shame of primitive societies; but some modern societies are sociophagous, and enslave and consume whole peoples. Until war is outlawed and overcome, civilization is a precarious interlude between catastrophes; "the possibility

of a high social . . . state fundamentally depends on the cessation of war."⁶¹

The hope of such a consummation lies not so much in the spiritual conversion of the hearts of men (for men are what the environment makes them), as in the development of industrial societies. Industry makes for democracy and peace: as life ceases to be dominated by war, a thousand centers of economic development arise, and power is beneficently spread over a large portion of the members of the group. Since production can prosper only where initiative is free, an industrial society breaks down those traditions of authority, hierarchy, and caste, which flourish in military states, and under which military states flourish. The occupation of the soldier ceases to be held in high repute; and patriotism becomes a love of one's country rather than a hatred of every other.⁶² Peace at home becomes the first need of prosperity, and as capital becomes international, and a thousand investments cross every frontier, international peace becomes a necessity as well. As foreign war diminishes, domestic brutality decreases; monogamy replaces polygamy because the life-tenure of men becomes almost equal to that of women; the status of women rises, and the "emancipation of women" becomes a matter of course.⁶³ Superstitious religions give way to liberal creeds whose focus of effort is the amelioration and ennoblement of human life and character on this earth. The mechanisms of industry teach men the mechanisms of the universe, and the notion of invariable sequences in cause and effect; exact investigation of natural causes replaces the easy resort

⁶¹II, 663. ⁶²II, 624-5. ⁶³I, 681.

to supernatural explanation.⁶¹ History begins to study the people at work rather than the kings at war; it ceases to be a record of personalities and becomes the history of great inventions and new ideas. The power of government is lessened, and the power of productive groups within the state increases; there is a passage "from status to contract," from equality in subordination to freedom in initiative, from compulsory co-operation to co-operation in liberty. The contrast between the militant and the industrial types of society is indicated by "inversion of the belief that individuals exist for the benefit of the State into the belief that the State exists for the benefit of the individuals."⁶³

While protesting vigorously against the growth of an imperialistic militarism in England, Spencer chose his country as a type of approach to the industrial society, and pointed to France and Germany as instances of the militant state.

"From time to time newspapers remind us of the competition between Germany and France in their military developments. The body politic, in either case, expends most of its energies in growths of teeth and claws—every increase on the one side prompting an increase on the other. . . . Recently the French Minister for Foreign Affairs, referring to Tunis, Tongking, the Congo, and Madagascar, enlarged on the need there had been for competing in political burglaries with other nations; and held that, by taking forcible possession of territories owned by inferior peoples, 'France has regained a certain portion of

⁶¹II, 599. ⁶³I, 575.

the glory which so many noble enterprises during previous centuries had insured her.' . . . Hence we see why, in France, as in Germany, a scheme of social re-organization under which each citizen, while maintained by the community, is to labor for the community, has obtained so wide an adhesion as to create a formidable political body—why among the French, St. Simon, Fourier, Proudhon, Cabet, Louis Blanc, Pierre Leroux, now by word and now by deed, have sought to bring about some form of communistic working and living. . . . Verification by contrast meets us on observing that in England, where the extent of ownership by others has been less than in France and Germany, alike under its military form and under its civil form, there has been less progress in sentiment and idea towards that form of ownership by others which socialism implies."⁶⁶

As this passage indicates, Spencer believes that socialism is a derivative of the militant and feudal type of state, and has no natural affiliation with industry. Like militarism, socialism involves the development of centralization, the extension of governmental power, the decay of initiative, and the subordination of the individual. "Well may Prince Bismarck display leanings towards State Socialism."⁶⁷ "It is the law of all organization that as it becomes complete it becomes rigid."⁶⁸ Socialism would be in industry what a rigid instinctive equipment is in animals; it would produce a community of human ants and bees, and would

⁶⁶III, 596-9. ⁶⁷*Social Statics*, p. 329.

⁶⁸*Sociology*, i, 571.

issue in a slavery far more monotonous and hopeless than the present condition of affairs.

"Under the compulsory arbitration which socialism would necessitate, . . . the regulators, pursuing their personal interests, . . . would not be met by the combined resistance of all workers; and their power, unchecked as now by refusals to work save on prescribed terms, would grow and ramify and consolidate until it became irresistible. . . . When from regulation of the workers by the bureaucracy we turn to the bureaucracy itself, and ask how it is to be regulated, there is no satisfactory answer. . . . Under such conditions there must arise a new aristocracy, for the support of which the masses would toil; and which, being consolidated, would wield a power far beyond that of any past aristocracy."⁶⁹

Economic relationships are so different from political relationships, and so much more complex, that no government could regulate them all without such an enslaving bureaucracy. State interference always neglects some factor of the intricate industrial situation, and has failed whenever tried; note the wage-fixing laws of medieval England, and the price-fixing laws of Revolutionary France. Economic relations must be left to the automatic self-adjustment (imperfect though it may be) of supply and demand. What society most wants it will pay for most heavily; and if certain men, or certain functions, receive great rewards it is because they have taken, or have involved, exceptional risks or pains. Men as now constituted will not tolerate a compulsory equality.

⁶⁹III, 588.

Until an automatically-changed environment automatically changes human character, legislation enacting artificial changes will be as futile as astrology.⁷⁰

Spencer was almost made sick by the thought of a world ruled by the wage-earning class. He was not enamored of trade-union leaders so far as he could know them through the refractory medium of the *London Times*.⁷¹ He pointed out that strikes are useless unless most strikes fail; for if all workers should, at various times, strike and win, prices would presumably rise in accord with the raised wages, and the situation would be as before.⁷² "We shall presently see the injustices once inflicted by the employing classes paralleled by the injustices inflicted by the employed classes."⁷³

Nevertheless his conclusions were not blindly conservative. He realized the chaos and brutality of the social system that surrounded him, and he looked about with evident eagerness to find a substitute. In the end he gave his sympathies to the co-operative movement; he saw in this the culmination of the passage from status to contract in which Sir Henry Maine had found the essence of economic history. "The regulation of labor becomes less coercive as society assumes a higher type. Here we reach a form in which the coerciveness has diminished to the smallest degree consistent with combined action. Each member is his own master in respect of the work he does; and is subject only to such rules, established by majority of the members, as are needful for maintaining order. The transition from the compulsory co-operation of militancy to the voluntary co-operation of industrialism is com-

⁷⁰Cf. *The Man vs. the State*.

⁷¹III, 589. ⁷²III, 545. ⁷³*Autob.*, ii, 433.

pleted."⁷⁴ He doubts if human beings are yet honest and competent enough to make so democratic a system of industry efficient; but he is all for trying. He foresees a time when industry will no longer be directed by absolute masters, and men will no longer sacrifice their lives in the production of rubbish. "As the contrast between the militant and the industrial types is indicated by inversion of the belief that individuals exist for the benefit of the state into the belief that the state exists for the benefit of individuals; so the contrast between the industrial type and the type likely to be evolved from it is indicated by inversion of the belief that life is for work into the belief that work is for life."⁷⁵

VII. ETHICS: THE EVOLUTION OF MORALS

So important does this problem of industrial reconstruction seem to Spencer that he devotes to it again the largest section of *The Principles of Ethics* (1893)—"this last part of my task . . . to which I regard all the preceding parts as subsidiary."⁷⁶ As a man with all the moral severity of the mid-Victorian, Spencer was especially sensitive to the problem of finding a new and natural ethic to replace the moral code which had been associated with the traditional faith. "The supposed supernatural sanctions of right conduct do not, if rejected, leave a blank. There exist natural sanctions no less pre-emptory, and covering a much wider field."⁷⁷

The new morality must be built upon biology. "Acceptance of the doctrine of organic evolution determines certain ethical conceptions."⁷⁸ Huxley, in his Romanes lecture at Oxford in

⁷⁴III, 572. ⁷⁵I, 575.

⁷⁶*Ethics*, vol. i, p. xiii. ⁷⁷I, 7. ⁷⁸I, 25.

1893, argued that biology could not be taken as an ethical guide; that "nature red in tooth and claw" (as Tennyson was phrasing it) exalted brutality and cunning rather than justice and love; but Spencer felt that a moral code which could not meet the tests of natural selection and the struggle for existence, was from the beginning doomed to lip-service and futility. Conduct, like anything else, should be called good or bad as it is well adapted, or maladapted, to the ends of life; "the highest conduct is that which conduces to the greatest length, breadth, and completeness of life."⁷⁹ Or, in terms of the evolution formula, conduct is moral according as it makes the individual or the group more integrated and coherent in the midst of a heterogeneity of ends. Morality, like art, is the achievement of unity in diversity; the highest type of man is he who effectively unites in himself the widest variety, complexity, and completeness of life.

This is a rather vague definition, as it must be; for nothing varies so much, from place to place and from time to time, as the specific necessities of adaptation, and therefore the specific content of the idea of good. It is true that certain forms of behavior have been stamped as good—as adapted, in the large, to the fullest life—by the sense of pleasure which natural selection has attached to these preservative and expansive actions. The complexity of modern life has multiplied exceptions, but normally, pleasure indicates biologically useful, and pain indicates biologically dangerous, activities.⁸⁰ Nevertheless, within the broad bounds of this principle, we find the most diverse, and apparently the most hostile, conceptions of the

⁷⁹I. 22, 26; ii, 3.

⁸⁰I, 98.

good. There is hardly any item of our Western moral code which is not somewhere held to be immoral; not only polygamy, but suicide, murder of one's own countrymen, even of one's parents, finds in one people or another a lofty moral approbation.

"The wives of the Fijian chiefs consider it a sacred duty to suffer strangulation on the deaths of their husbands. A woman who had been rescued by Williams 'escaped during the night, and, swimming across the river, and presenting herself to her own people, insisted on the completion of the sacrifice which she had in a moment of weakness reluctantly consented to forego'; and Wilkes tells of another who loaded her rescuer 'with abuse,' and ever afterwards manifested the most deadly hatred towards him."⁸¹ "Livingstone says of the Makololo women, on the shores of the Zambesi, that they were quite shocked to hear that in England a man had only one wife: to have only one was not 'respectable.' So, too, in Equatorial Africa, according to Reade, 'If a man marries, and his wife thinks that he can afford another spouse, she pesters him to marry again; and calls him a 'stingy fellow' if he declines to do so.'"⁸²

Such facts, of course, conflict with the belief that there is an inborn moral sense which tells each man what is right and what is wrong. But the association of pleasure and pain, on the average, with good or evil conduct, indicates a measure of truth in the idea; and it may very well be that certain moral conceptions, acquired by the race, become hereditary with the individual.⁸³ Here Spencer uses his

⁸¹I, 469. ⁸²I, 327. ⁸³I, 471.

favorite formula to reconcile the intuitionist and the utilitarian, and falls back once more upon the inheritance of acquired characters.

Surely, however, the innate moral sense, if it exists, is in difficulties today; for never were ethical notions more confused. It is notorious that the principles which we apply in our actual living are largely opposite to those which we preach in our churches and our books. The professed ethic of Europe and America is a pacifistic Christianity; the actual ethic is the militaristic code of the marauding Teutons from whom the ruling strata, almost everywhere in Europe, are derived. The practice of duelling, in Catholic France and Protestant Germany, is a tenacious relic of the original Teutonic code.⁸⁴ Our moralists are kept busy apologizing for these contradictions, just as the moralists of a later monogamic Greece and India were hard put to it to explain the conduct of gods who had been fashioned in a semi-promiscuous age.⁸⁵

Whether a nation develops its citizens on the lines of Christian morality or the Teutonic code depends on whether industry or war is its dominant concern. A militant society exalts certain virtues and condones what other peoples might call crimes; aggression and robbery and treachery are not so unequivocally denounced among peoples accustomed to them by war, as among peoples who have learned the value of honesty and non-aggression through industry and peace. Generosity and humanity flourish better where war is infrequent and long periods of productive tranquillity inculcate the advantages of mutual aid.⁸⁶ The patriotic member of a militant society will look upon bravery and strength as the highest virtues of a man; upon

⁸⁴I, 323. ⁸⁵I, 458. ⁸⁶I, 391f.

obedience as the highest virtue and upon silent submission to the will of the citizen; hood as the highest virtue, the multiple mother-Kaiser thought of God as the leader of the German army, and followed up his approbation of duelling by attending divine service.⁸⁷ The North American Indians "regarded the use of the bow and arrow, the war-club and spear, as the noblest employments of man. . . . They looked upon agricultural and mechanical labor as degrading. Only now more and more that national welfare is becoming more dependent on superior powers of production," and these "on the higher mental faculties, are other occupations than militant ones, are rising into respectability."⁸⁸

Now war is merely wholesale cannibalism; and there is no reason why it should not be classed with cannibalism and unequivocally denounced. "The sentiment and the idea of justice can grow only as fast as the external antagonisms of societies decrease, and the internal harmonious co-operations of their members increase."⁸⁹ How can this harmony be promoted? As we have seen, it comes more readily through freedom than through regulation. The formula of justice should be: "Every man is free to do that which he wills, provided he infringes not the equal freedom of any other man."⁹¹ This is a formula hostile to war, which exalts authority, regimentation and obedience; it is a formula favorable to peaceful industry, for it provides a maximum of stimulus with an absolute equality of opportunity; it is conformable to Christian morals, for it holds every person sacred, and frees him from aggression;⁹² and it has the sanction of that ultimate judge

⁸⁷Cf. the philosophy of Nietzsche.

⁸⁸I, 318. ⁸⁹I, 423-4. ⁹⁰I, 377. ⁹¹II, 46. ⁹²I, 257.

—natural selection—because it opens up the resources of the earth on equal terms to all, and permits each organism and individual to prosper according to its ability and its work.

Liberty contends with Evolution for priority in Spencer's affections;⁹⁴ and Liberty wins. He thinks that as war decreases, the control of the individual by the state loses most of its excuse;⁹⁵ and in a condition of permanent peace the state would be reduced within Jeffersonian bounds, acting only to prevent breaches of equal freedom. Such justice should be administered without cost, so that wrong-doers might know that the poverty of their victims would not shield them from punishment; and all the expenses of the state should be met by direct taxation, lest the invisibility of taxation should divert public attention from governmental extravagance.⁹⁶ But "beyond maintaining justice, the state cannot do anything else without transgressing justice";⁹⁷ for it would then be protecting inferior individuals from that natural apportionment of reward and capacity, penalty and incapacity, on which the survival and improvement of the group depend.

The principle of justice would require common ownership of land, if we could separate the land from its improvements.⁹⁸ In his first book, Spencer had advocated nationalization of the soil, to equalize economic opportunity; but he withdrew his contention later (much to the disgust of Henry George, who called him "the perplexed philosopher"), on the ground that land is carefully husbanded only by the family that owns it, and that can rely on transmitting to its own descendants the effects of the labor put into it. As for private property, it derives

⁹⁴Elliott, *Herbert Spencer*, p. 81.

⁹⁵I, 148, 420. ⁹⁶II, 200. ⁹⁷II, 222. ⁹⁸II, 81.

immediately from the law of justice, for each man should be equally free to retain the products of his thrift. The justice of bequests is not so obvious; but the "right to bequeath" is included in the right of ownership, since otherwise the ownership is not complete.⁹⁹ Trade should be as free among nations as among individuals; the law of justice should be no merely tribal code, but an inviolable maxim of international relations.

These are, in outline, the real "rights of man"—the right to life, liberty, and the pursuit of happiness on equal terms with all. Beside these economic rights, political rights are unimportant unrealities.¹⁰⁰ Since only economic rights avail, women are misled when they spend so much time seeking the franchise. Spencer fears that the maternal instinct for helping the helpless may lead women to favor a paternalistic state.¹⁰¹ There is some confusion in his mind on this point; he argues that political rights are of no importance, and then that it is very important that women should not have them; he denounces war, and then contends that women should not vote because they do not risk their lives in battle¹⁰²—a shameful argument for any man to use who has been born of woman. He is afraid of women because they may be too altruistic; and yet the culminating conception of his book is that industry and peace will develop altruism to the point where it will balance egoism and so evolve the spontaneous order of a philosophic anarchism.

The conflict of egoism and altruism (this word, and something of this line of thought, Spencer takes, more or less unconsciously, from

⁹⁹II, 120.

¹⁰⁰II, 192-3.

¹⁰¹II, 196-7.

¹⁰²II, 166.

Comte) results from the conflict of the individual with his family, his group, and his race. Presumably egoism will remain dominant; but perhaps that is desirable. If everybody thought more of the interests of others than of his own we should have a chaos of curtsies and retreats; and probably "the pursuit of individual happiness within the limits prescribed by social conditions is the first requisite to the attainment of the greatest general happiness."¹⁰³ What we may expect, however, is a great enlargement of the sphere of sympathy, a great development of the impulses to altruism. Even now the sacrifices entailed by parentage are gladly made; "the wish for children among the childless, and the occasional adoption of children, show how needful for the attainment of certain egoistic satisfactions are these altruistic activities."¹⁰⁴ The intensity of patriotism is another instance of the passionate preference of larger interests to one's immediate concerns. Every generation of social living deepens the impulses to mutual aid.¹⁰⁵ "Unceasing social discipline will so mould human nature that eventually, sympathetic pleasures will be spontaneously pursued to the fullest extent advantageous to all."¹⁰⁶ The sense of duty, which is the echo of generations of compulsion to social behavior, will then disappear; altruistic actions, having become instinctive through their natural selection for social utility, will, like every instinctive operation, be performed without compulsion, and with joy. The natural evolution of human society brings us ever nearer to the perfect state.

VIII. CRITICISM

- The intelligent reader, in the course of this brief analysis,¹⁰⁷ will have perceived certain difficulties in the argument, and will need no more than some scattered reminders as to where the imperfections lie. Negative criticism is always unpleasant, and most so in the face of a great achievement; but it is part of our task to see what time has done to Spencer's synthesis.

1. FIRST PRINCIPLES

The first obstacle, of course, is the Unknowable. We may cordially recognize the probable limitations of human knowledge; we cannot quiteathom that great sea of existence of which we are merely a transient wave. But we must not dogmatize on the subject, since in strict logic the assertion that anything is unknowable already implies some knowledge of the thing. Indeed, as Spencer proceeds through his ten volumes, he shows "a prodigious knowledge of the unknowable."¹⁰⁸ As Hegel put it: to limit reason by reasoning is like trying to swim without entering the water. And all this logic-chopping about "inconceivability"—how far away that seems to us now, how like those sophomoric days when to be alive was to de-

¹⁰⁷The analysis, of course, is incomplete. "Space forbids" (the author has often smiled at this cloak for laziness, but must offer it here) a discussion of the *Education*, the *Essays*, and large sections of the *Sociology*. The lesson of the *Education* has been too well learned; and we require today some corrective of Spencer's victorious assertion of the claims of science as against letters and the arts. Of the essays, the best are those on style, laughter, and music. Hugh Elliott's *Herbert Spencer* is an admirable exposition.

¹⁰⁸Browne: *Kant and Spencer*, p. 253.

bate! And for that matter, an unguided machine is not much more conceivable than a First Cause, particularly if, by this latter phrase, we mean the sum total of all causes and forces in the world. Spencer, living in a world of machines, took mechanism for granted; just as Darwin, living in an age of ruthless individual competition, saw only the struggle for existence.

What shall we say of that tremendous definition of evolution? Does it explain anything? "To say, 'first there was the simple and then the complex was evolved out of it,' and so on, is not to explain nature."¹⁰⁹ Spencer, says Bergson, repieces, he does not explain;¹¹⁰ he misses, as he at last perceives, the vital element in the world. The critics, evidently, have been irritated by the definition; its Latinized English is especially arresting in a man who denounced the study of Latin, and defined a good style as that which requires the least effort of understanding. Something must be conceded to Spencer, however; no doubt he chose to sacrifice immediate clarity to the need of concentrating in a brief statement the flow of all existence. But in truth he is a little too fond of his definition; he rolls it over his tongue like a choice morsel, and takes it apart and puts it together again interminably. The weak point of the definition lies in the supposed "instability of the homogeneous." Is a whole composed of like parts more unstable, more subject to change, than a whole composed of unlike parts? The heterogeneous, as more complex, would presumably be more unstable than the homogeneously simple. In ethnology and politics it is taken for granted that hetero-

¹⁰⁹Ritchie: *Darwin and Hegel*, p. 60.

¹¹⁰*Creative Evolution*, p. 64.

geneity makes for instability, and that the fusion of immigrant stocks into one national type would strengthen a society. Tarde thinks that civilization results from an increase of similarity among the members of a group through generations of mutual imitation; here the movement of evolution is conceived as a progress towards homogeneity. Gothic architecture is surely more complex than that of the Greeks; but not necessarily a higher stage of artistic evolution. Spencer was too quick to assume that what was earlier in time was simpler in structure; he underrated the complexity of protoplasm, and the intelligence of primitive man¹¹¹. Finally, the definition fails to mention the very item which in most minds today is inalienably associated with the idea of evolution—namely, natural selection. Perhaps (imperfect though this too would be) a description of history as a struggle for existence and a survival of the fittest—of the fittest organisms, the fittest societies, the fittest moralities, the fittest languages, ideas, philosophies—would be more illuminating than the formula of incoherence and coherence, of homo- and heterogeneity, of dissipation and integration?

"I am a bad observer of humanity in the concrete," says Spencer, "being too much given to wandering into the abstract."¹¹² This is dangerous honesty. Spencer's method, of course, was too deductive and *a priori*, very different from Bacon's ideal or the actual procedure of scientific thought. He had, says his secretary, "an inexhaustible faculty of developing *a priori* and *a posteriori*, inductive and deductive, arguments in support of any imaginable proposition;¹¹³ and the *a priori* arguments were prob-

¹¹¹Cf. Franz Boas: *The Mind of Primitive Man*.

¹¹²*Autob.*, II, 461. ¹¹³Royce, 194.

ably prior to the others. Spencer began, like a scientist, with observation; he proceeded, like a scientist, to make hypotheses; but then, unlike a scientist, he resorted not to experiment, nor to impartial observation, but to the selective accumulation of favorable data. He had no nose at all for "negative instances." Contrast the procedure of Darwin, who, when he came upon data unfavorable to his theory, hastily made note of them, knowing that they had a way of slipping out of the memory a little more readily than the welcome facts!

2. BIOLOGY AND PSYCHOLOGY

In a foot-note to his essay on "Progress," Spencer candidly confesses that his ideas of evolution were based on Lamarck's theory of the transmissibility of acquired characters, and were not really an anticipation of Darwin, whose essential idea was the theory of natural selection. He is rather the philosopher of Lamarckianism, then, than the philosopher of Darwinism. He was almost forty when the *Origin of Species* appeared; and at forty one's categories are hardened into immutability.

Aside from lesser difficulties, like the failure to reconcile his illuminating principle—that reproduction decreases as development advances—with such facts as the higher rate of reproduction in civilized Europe as compared with savage peoples, the major defects of his biological theory are his reliance on Lamarck and his failure to find a dynamic conception of life. When he confesses that life "cannot be conceived in physico-chemical terms,"¹¹⁴ the "admission is fatal to his formula of evolution, to his definition of life, and to the coherence of the Synthetic Philosophy."¹¹⁵ The secret of life

¹¹⁴*Biology*, i, 120.

¹¹⁵J. A. Thomson, *Herbert Spencer*, p. 109.

might better have been sought in the power of mind to adjust external to internal relations than in the almost passive adjustment of the organism to the environment. On Spencer's premises, complete adaptation would be death.

The volumes on psychology formulate rather than inform. What we knew is reshaped into an almost barbarously complex terminology, which obscures where it should clarify. The reader is so fatigued with formulas and definitions and questionable reductions of psychological facts to neural structures that he may fail to observe that the origin of mind and consciousness is left quite unexplained. It is true that Spencer tries to cover up this gaping chasm in his system of thought by arguing that mind is the subjective accompaniment of nerve processes evolved mechanically, somehow, out of the primeval nebula; but why there should be this subjective accompaniment in addition to the neural mechanism, he does not say. And that, of course, is just the point of all psychology.

3. SOCIOLOGY AND ETHICS

Magnificent as the Sociology is, its 2,000 pages give many an opening for attack. Running through it is Spencer's usual assumption that evolution and progress are synonymous, whereas it may well be that evolution will give to insects and bacteria the final victory in their relentless war with man. It is not quite evident that the industrial state is either more pacific or more moral than the "militant" feudalism that preceded it. Athens' most destructive wars came long after her feudal lords had yielded power to a commercial bourgeoisie; and the countries of modern Europe seem to make war with blithe indifference as to whether they are industrial or not; industrial imperialism may be as militaristic as

land-hungry dynasties. The most militaristic of modern states was one of the two leading industrial nations of the world. Further, the rapid industrial development of Germany seems to have been aided, rather than impeded, by state control of certain phases of transport and trade. Socialism is obviously a development not of militarism but of industrialism. Spencer wrote at a time when the comparative isolation of England made her pacifist (in Europe), and when her supremacy in commerce and industry made her a firm believer in free trade; he would have been shocked had he lived to see how readily the free trade theory would disappear along with commercial and industrial supremacy, and how the pacifism would disappear as soon as Germany's assault on Belgium threatened English isolation. And of course Spencer exaggerated the virtues of the industrial regime; he was almost blind to the brutal exploitation that flourished in England before the state interfered to mitigate it; all that he could see "in the middle of our century, especially in England," was "a degree of individual freedom greater than ever before existed."¹¹⁶ No wonder that Nietzsche reacted in disgust from industrialism, and exaggerated, in his turn, the virtues of the military life.¹¹⁷

The analogy of the social organism would have driven Spencer into state socialism had his logic been more powerful than his feelings; for state socialism represents, in a far higher degree than a *laissez-faire* society, the integration of the heterogeneous. By the yard-stick of his own formula Spencer would have been

¹¹⁶*Sociology*, iii, 607. Cf. *The Study of Sociology*, p. 335: "The testimony is that higher wages commonly result only in more extravagant living or in drinking to greater excess."

¹¹⁷Cf. *The Joyful Wisdom*, sect. 10.

compelled to acclaim Germany as the most highly evolved of modern states. He tried to meet this point by arguing that heterogeneity involves the freedom of the parts, and that such freedom implies a minimum of government; but this is quite a different note than that which we heard in "*coherent heterogeneity*." In the human body integration and evolution leave rather little freedom to the parts. Spencer replies that in a society consciousness exists only in the parts, while in the body consciousness exists only in the whole. But social consciousness—consciousness of the interests and processes of the group—is as centralized in society as personal consciousness is in the individual. Spencer helped to save us from a regimental state socialism, but only by the sacrifice of his consistency and his logic.

And only by individualistic exaggerations. We must remember that Spencer was caught between two eras; that his political thinking had been formed in the days of *laissez-faire*, and under the influence of Adam Smith; while his later years were lived in a period when England was struggling to correct, by social control, the abuses of her industrial regime. He never tired of reiterating his arguments against state-interference; he objected to state-financed education, or to governmental protection of citizens against fraudulent finance;¹¹⁸ at one time he argued that even the management of war should be a private, and not a state, concern;¹¹⁹ he wished, as Wells put it, "to raise public shiftlessness to the dignity of a national policy." He carried his MSS. to the printer himself, having too little confidence in a government institution to entrust them to the Post

¹¹⁸*Autob.*, ii, 5.

¹¹⁹I, 239.

Office.¹²⁰ He was a man of intense individuality, irritably insistent on being let alone; and every new act of legislation seemed to him an invasion of his personal liberty. He could not understand Benjamin Kidd's argument, that since natural selection operates more and more upon groups, in class and international competition, and less and less upon individuals, a widening application of the family-principle (whereby the weak are aided by the strong) is indispensable for the maintenance of group unity and power. Why a state should protect its citizens from unsocial physical strength and refuse protection against unsocial economic strength is a point which Spencer ignores. He scorned as childish the analogy of government and citizen with parent and child; but the real analogy is with brother and brother. His politics were more Darwinian than his biology.

But enough of these criticisms. Let us turn back to the man again, and see in fairer perspective the greatness of his work.

IX. CONCLUSION

First Principles made Spencer almost at once the most famous philosopher of his time. It was soon translated into most of the languages of Europe; even in Russia, where it had to face and defeat a government prosecution. He was accepted as the philosophic exponent of the spirit of the age; and not only did his influence pass everywhere into the thought of Europe, but it strongly affected the realistic movement in literature and art. In 1869 he was astounded to find that *First Principles* had been adopted as a text-book at Oxford.¹²¹ More marvelous still, his books began, after 1870, to

¹²⁰Collier, in Royce, 221. ¹²¹*Autob.*, ii, 242.

bring him returns that made him financially secure. In some cases admirers sent him substantial gifts, which he always returned. When Czar Alexander II visited London, and expressed to Lord Derby a desire to meet the distinguished savants of England, Derby invited Spencer, Huxley, Tyndall, etc. The others attended, but Spencer declined. He associated with only a few intimates. "No man is equal to his book," he wrote. "All the best products of his mental activity go into his book, where they come separated from the mass of inferior products with which they are mingled in his daily talk."¹²² When people insisted on coming to see him he inserted stopping into his ears, and listened placidly to their inaudible conversation.

Strange to say, his fame vanished almost as suddenly as it had come. He outlived the height of his own repute, and was saddened, in his last years, by seeing what little power his tirades had to stop the tide of "paternalistic" legislation. He had become unpopular with almost every class. Scientific specialists whose privileged fields he had invaded damned him with faint praise, ignoring his contributions and emphasizing his errors; and bishops of all creeds united in consigning him to an eternity of punishment. Laborites who liked his denunciations of war turned from him in anger when he spoke his mind on socialism and on trade-union politics; while conservatives who liked his views on socialism shunned him because of his agnosticism. "I am more Tory than any Tory and more radical than any Radical," he said, wistfully.¹²³ He was incorrigibly sincere, and offended every group by speaking candidly on every subject: after sympathizing

¹²²*Autob.*, i, 423. ¹²³II, 431.

with the workers as victims of their employers, he added that the workers would be as domineering if positions were reversed; and after sympathizing with women as victims of men, he did not fail to add that men were the victims of women so far as the women could manage it. He grew old alone.

As he aged he became more gentle in opposition, and more moderate in opinion. He had always laughed at England's ornamental king, but now he expressed the view that it was no more right to deprive the people of their king than it was to deprive a child of its doll.¹²⁴ So in religion he felt it absurd and unkind to disturb the traditional faith where it seemed a beneficent and cheering influence.¹²⁵ He began to realize that religious beliefs and political movements are built upon needs and impulses beyond the reach of intellectual attack; and he reconciled himself to seeing the world roll on without much heeding the heavy books he hurled in its direction. Looking back over his arduous career, he thought himself foolish for having sought literary fame instead of the simpler pleasures of life.¹²⁶ When he died, in 1903, he had come to think that his work had been done in vain.¹²⁷

We know now, of course, that it was not so. The decay of his reputation was part of the English Hegelian reaction against positivism; the revival of liberalism will raise him again to his place as the greatest English philosopher of his century. He gave to philosophy a new contact with things, and brought to it a realism which made German philosophy seem, beside it,

¹²⁴Elliott, p. 66.

weakly pale and timidly abstract. He summed up his age as no man had ever summed up any age since Dante; and he achieved so masterly a co-ordination of so vast an area of knowledge that criticism is almost shamed into silence by his achievement. We are standing now on heights which his struggles and his labors won for us; we seem to be above him because he has raised us on his shoulders. Some day, when the sting of his opposition is forgotten, we shall do him better justice.

INTRODUCTION

To many persons mention of the word "hypnotism" at once brings to mind a "Professor" in full-dress suit on a vaudeville stage putting "subjects" through laugh-provoking antics. Or the image of Svengali rises before the mind's eyes, with long, lank fingers making mystic "passes" before the now helpless—not to say enslaved—victim, fascinated by the large, black, "sorcerer" eyes of the great master.

To such persons the "hypnotist" is rather closely identified with the "charlatan." Happily, this conception of hypnotists and hypnotism is fading out in the strong, clear light of modern science.

Hypnotism and Suggestion (two phases of the same phenomenon) have now taken their legitimate places in psychology and medicine as subjects intimately related to our everyday life, in health and in disease. Whether we know it or not, Suggestion is at work all around and within us, day and night, from earliest childhood to the very close of our lives.

Hypnotism and suggestion have—against strong opposition—won an important place in the history of medicine. It has been amply demonstrated that certain maladies which have stubbornly resisted the regular medical treatment often yield to psycho-therapeutic methods (mind treatment). The time has long since passed when medical science scoffed at the

idea of alleviating or entirely removing pain and certain pathological conditions by suggestion in mild cases and hypnotism in more stubborn, deep-seated afflictions.

What is the "Applied Psychology" about which we hear so much nowadays, but the application of the established principles of suggestion to the problems of social life and the affairs of prosaic business? Applied psychology—for a course of ten lessons for which enterprising "leaders of thought" are charging \$100—is nothing more or less than hypnotism and suggestion "made plain." Investigation will readily show that the principles of suggestion are applicable to the affairs of business and social life. But hypnosis and suggestion may also play a sinister part in intellectual, social and political life, and need to be understood as a matter of self-protection.

From what has been said—and I shall adduce abundant proofs in succeeding pages in support of the statements made above—it may be seen that to give a little time and study to the elementary principles of hypnotism and suggestion is not merely a form of diversion, but a measure of self-defense as well as a means of self-improvement, resulting often in improved health, a happier frame of mind, and even worldly success.

HYPNOTISM MADE PLAIN

CHAPTER 1.

A RETROSPECT

The story of the origin and development of hypnotism—or mesmerism, as it was once called—is not only interesting in itself, as history, but also helpful to a clear understanding of its modern phases and applications.

What we now call suggestion and hypnotism, and recognize as purely psychological phenomena, were originally believed to be manifestations of a peculiar, universally disseminated fluid, analogous to the ether of the physicists, which could be absorbed by various substances and discharged therefrom.

As early as 1530, the celebrated Swiss physician Paracelsus (1493-1541)—founder of medical chemistry—advanced the theory of “personal magnetism,” or magnetic influences, derived from the universal cosmic magnetic “fluid” or force which, he declared, bound the stars together, and permeated all living things. Each man carries within his own body, he said, a twofold magnetism, one healthful, the other morbid. The magnetism of a healthy person attracts the morbid magnetism of a sick person, thus relieving the latter of his malady. Absorbed by the healthy person, the morbid magnetic force is transformed at once into wholesome magnetism.

Dr. Aureolus Theophrastus Bombastus Paracelsus von Hohenheim—Paracelsus’ real name—may or may not have fully believed in his

theory of transferable magnetism. He was—for his time—a great physician, and as such a very practical man—a forerunner of the modern pragmatists. If belief in his doctrine on the part of his patient would act as a curative agency, Paracelsus would undoubtedly utilize this doctrine, just as he did astrology—belief in which was universal in his day and age. He appears to have been fully aware of the value of faith if not of suggestion in the cure of disease. “It is all one,” he remarks, “whether you believe in something real or something false, it will have the same effect upon you. . . . It is always the faith that works the miracle, and whether the faith is aroused by something real or something false its miraculous power is the same.”

A few years later, Jean Baptist van Helmont, “father of chemistry” (1577-1644), stimulated by diligent perusal of the works of Paracelsus, adopted and expounded the doctrine that man possessed a magnetic force capable of healing the sick.¹

The Paracelsean doctrine of a healing magnetic force was introduced into England by Robert Fludd (1574-1637), the physician and theosophist (a partisan of the Rosicrucians).

¹Van Helmont was first to prove the indestructibility of matter in chemical changes by utilizing the balance in analysis, invented the word “gas”, and first used the melting-point of ice and the boiling-point of water as limits of a thermometric scale. He opposed the view of Descartes that the pineal gland is the seat of the soul, his physiological investigations leading him to the conviction that the temple of that entity is the stomach!

We hear little or nothing of this doctrine in French works until the year 1766, when appeared the dissertation, "*De planetarum influxu*" ("On the Influence of the Planets"), of the Viennese physician, Friedrich Anton Mesmer (1734-1815) — born near Constance, and later resident in Paris.

Mesmer, like Paracelsus, believed that a magnetic element or fluid pervaded the universe and pervaded all bodies. Following Descartes, he denied that there could be a vacuum anywhere within the cosmos, since the mutual influence between the stars and planets "is transmitted by a fluid universally disseminated, and everywhere continuous, so that no vacuum can exist." This universal fluid—analogous to the hypothetic ether of space of modern physicists—"is, by its very nature, enabled to receive and retain all impressions of movement, to propagate them and transmit them." In the human body this medium expresses itself in conditions related to magnetism, and the forces exhibited are of the nature of *Animal Magnetism*. This force, says Mesmer, may be transferred from the human body to both inanimate and animate bodies, certain substances being more susceptible to this influence than others. "The magnet, too, artificial, as well as natural, is susceptible to animal magnetism, without any impairment of its influence upon iron or the magnetic needle. From this we see that the artificial magnet possesses qualities which are efficacious in sickness, and that if we obtain successful results from its application, these are due merely to animal magnetism."

Mesmer laid down rules of procedure in accordance with which "this principle is able to cure maladies of the nervous system directly, and other maladies indirectly."

This method of healing was put into practice in Vienna about 1763, with the co-operation of Dr. Maximillian Hell, Professor of Astronomy, and it is recorded that a number of cures were effected.

Having been bred for the church, it was not difficult for Dr. Mesmer to pass from a belief in cures by "sacred relics" to the treatment of diseases by application of magnetized plates, rings, collars, amulets, etc. As in the case of many "faith" healers of our own day, Mesmer's fame soon became widespread, reports of his marvelous cures even reaching the court of Louis XVI.

Under the patronage of Marie Antoinette, Mesmer held seances to which people of all classes flocked for treatment, including many men distinguished in the arts and sciences. Unfortunately, Mesmer elected to invest himself and his procedure with an atmosphere of mysticism, arraying himself in yellow robes, bearing a wand in his hand, suggestive of the staff of the ancient followers of Aesculapius.

In the light of our present-day knowledge regarding the power of suggestion as a curative agent, we are not surprised to learn that Dr. Mesmer was able to effect many remarkable cures by convincing his patients of the therapeutic virtues of his magnetized paraphernalia.

Believing as he undoubtedly did that he possessed an "animal magnetism" which could be

transferred to inanimate substances, including water, glass, iron, etc., Mesmer constructed his curious "baquet." This weird apparatus consisted of a wooden tub with an iron rod placed vertically in the center, around which were arranged layers of corked bottles filled with magnetized water—"magnetized" by his own hands, just as he believed he could pass his own "magnetic fluid" directly into the body of a patient. Each bottle was supplied with a conductor, i. e., an iron wire running through the cork and in contact with the central rod. The tub was filled with water, iron filings, pounded glass and sand, previously magnetized by passes of Mesmer's hands, or by his merely breathing upon them. That the magnetic effluvia might not escape and be dissipated in space, a closely-fitting cover was placed on the tub. "Conductors" passed from the source of the emanations, or fluid, to the patient—woolen or cotton cords, which the patients twined around their bodies. Soft iron rods projected from the baquet, which were placed in contact with any desired part of the patient's body.

Seated around the baquet, lulled by soft music issuing from the adjoining room, the patients gazed at the dim light, in a more or less hypnotic condition, while the "animal magnetism" supplied by the baquet did its curative work. Mesmer and his assistants passed from one patient to another, making mystic passes over them—directing the fluid—or touching them with the rods. Patients of hysterical temperament sometimes fell into convulsions, which were interpreted by Mesmer as a

favorable sign. He even went so far as to assert that there could be no permanent cures without these so-called "crises." It was not long before Mesmer was publicly denounced as a charlatan and disappeared from the public eye.

Mesmer's sensational success doubtless aroused the jealousy of the "regular" medical profession. It is known that his claims were very superficially investigated by a committee of scientists. He was duly branded as a quack, and retired into comparative obscurity, "to walk silent on the shore of the Bodensee, meditating on much." A monument marks his grave in the churchyard of the Meersburg, placed there by admiring German physicians.

Mesmer honestly regarded himself as a martyr, the victim of envious competitors. And we need not doubt that many victims of disease were aided or actually cured by his methods, though no magnetic fluid issued from his rings and amulets to be guided by his mystic wand; just as in our days sufferers are helped—through auto-suggestion—by the "anti-rheumatic ring," "electric" belts and pads void of electricity, or pink pills containing no curative drugs. All of these devices are but modern recrudescences of the very ancient practice of suggestion and hypnosis, "laying on of hands," touching the king's gold ring, or the ancient custom of healing by the art of making passes.

In the temples of Isis, of Osiris and of Serapis, hypnotism and suggestion were common practices. Indeed, some form of psycho-therapeutics, by means of touch or passes, was practiced amongst all the nations of antiquity

whose records have come down to us even in fragmentary form. We are assured by Plutarch that Pyrrhus, the famous king of Epirus, was able to relieve colic and affections of the spleen by laying the patients on their backs and passing his great toe over them. Cures by the laying on of hands were effected also by pagan Roman emperors and Christian saints, as well as by the priests of ancient Egypt, Babylonia, Assyria, Chaldea, Persia, China and India—accompanied by mystic “passes.”

Why not, then, cures by the baquet of Mesmer, or the “Oscilloclast” of Dr. Albert Abrams, as well as the healing at Lourdes, St. Anne de Beaupré and other shrines? A magnetic element pervades the universe and penetrates all bodies, said Mesmer, capable of receiving and communicating all kinds of motions and impressions. All bodies are radio-active, said Abrams, and emit electronic vibrations (?) capable of reinforcing and finally breaking down the electronic waves characteristic of each disease. Relics of the saints have the power of healing the sick, says the Roman Catholic Church. And in each case the cures are assuredly made—by suggestion and auto-suggestion.

When an Australian aborigine believes (imagines) that an enemy has struck him at a distance, to all intents and purposes he is so struck. Promptly he lies down and becomes actually ill—through the power of auto-suggestion—frequently followed by gradual loss of vitality ending before long in death (Klaatsch). But this power of the imagination (auto-suggestion) to work harm—as well as

good—is not confined to savages. Baudouin tells of a case, noted by Coué, of a nun who was confined to her bed by illness during the winter. She soon recovered, becoming well and strong again. On April 1st her appetite disappeared, in a few days she was again confined to her bed, and she died before the end of the month. She thought she had heard her physician say, during her winter illness, "She won't outlive April." The suggestion that she was to die before the close of April became fixed in her mind, so, feeling sure that she would die in April, in April she died. Many similar cases are on record.

With the exception of the private—and gratuitous—work carried on by the Marquis de Puységur, who substituted a gentle sleep for convulsions, and by the Abbé Faria, who was the first to state the doctrine of suggestion, we hear very little about mesmerism in France for some years following the retirement of its founder.

In England a number of physicians became interested. Among the pioneers should be mentioned John Elliotson (1837), whose attention was directed to the subject by a French nobleman, to whose house leading members of the medical profession had been invited to witness a demonstration. Dr. Elliotson was profoundly impressed by the experiments there witnessed, and used his position on the staff of University College Hospital to employ mesmerism in treating patients. He was particularly successful in cases of nervous diseases. As President of the Royal Medical and Chirurgical Societies, his opinion would, in any other instance, have

carried great weight. Owing to the characteristic conservatism not only of the medical profession, but of scientists in general, his use of mesmerism in the hospital, though remarkably successful, was met by the violent opposition that pertains to most radical departures from the practices sanctioned by "authority." Refusing to bow to the mandate of unreasoned conservatism, Dr. Elliotson was obliged to resign. Retiring to private practice, he continued the use of mesmerism with increasingly satisfactory results, though unaware of the fact that no "animal magnetism"—or vital fluid—was involved in the process. This discovery was due to James Braid, a noted surgeon of Manchester.

Having witnessed a public exhibition of so-called mesmerism, Braid became convinced (1841) that there was therapeutic value in the method. He determined to explore the subject thoroughly, concerning himself not only with the practical application of hypnotism, but also with an attempt to explain the fundamental nature of the phenomena witnessed. Accepting, tentatively, the theories advanced by Mesmer, he soon arrived at the conclusion that there was no "vital force" or "animal magnetism" involved; hence there could be no question of magnets, metals, and crystals transmitting such a curative fluid. Braid found, by experiment, that he could produce all the phenomena attributed to the action of Mesmer's "vital fluid" by merely inducing the patient to fix his gaze upon any bright object, held at a short distance in front of and slightly higher than the level of the patient's eyes, ac-

accompanied by concentration of the mind on the object. The desired state of drowsiness or even complete unconsciousness was shown to be evokable without resort to magnets or passes, the phenomenon being entirely subjective, and quite independent of "animal magnetism." He attributed hypnosis to a tiring of the sensory organs.

Braid noted that the depths of the sleep induced varied in different persons from slight drowsiness to a state of complete unconsciousness. The latter condition he defined as "neurohypnotism, or nervous sleep, a peculiar condition of the nervous system produced by artificial contrivance." He later proposed that this condition be termed Hypnosis, and the process involved Hypnotism, or Neurohypnology, limiting the term "hypnotic sleep" to those cases where on awakening entire forgetfulness of all that had occurred during sleep was acknowledged by the patient. Braid was first to demonstrate that there is a close relationship between hypnosis and natural sleep.

As might be expected by a student of the history of science, Braid's very important work failed to elicit the support and encouragement of the British medical fraternity, who should have been most profoundly interested in his results. In Germany and Switzerland, however, his name was held in honor, a number of investigators on the Continent having become deeply interested in the practical application of hypnotism to medical practice. Among these may be mentioned Krafft-Ebing, Preyer, Oskar Vogt, Euelenburg, Heidenhain, Wetterstrand, Forel and Albert Moll. It has

well been said that Braid laid the foundation of the theories elaborated later (1891-4) by F. W. H. Myers, of Cambridge, and Carpenter, basing the phenomena of hypnotism on the existence and activity of a subliminal consciousness.

In 1860, the year of Braid's death, his discovery of the subjective nature of so-called mesmerism was published by the Paris Academy of Science.

The researches of Braid attracted the attention of Dr. Liébault, of Nancy, who, in 1864, opened up a dispensary in that town for the gratuitous treatment of the poor by hypnotism. Braid was first to assert that suggestion was the only external factor involved in producing the phenomena of hypnosis, but the credit for demonstrating this fact beyond a doubt is usually given to Liébault, who disavowed Braid's "tired senses" theory, pronouncing hypnotism to be wholly the result of suggestion (in an essay in 1866). This pioneer did not, however, explain the condition of mind necessary for the production of the phenomena of hypnotism. The elucidation of this problem was the work of F. W. H. Myers.

Myers assumed that man is endowed with both a supraliminal consciousness and a subliminal or subconscious intelligence—taking ordinary consciousness as a hypothetical level or limen (threshold). This theory does not predicate the existence of two minds, however, or two separate intelligences. Myers wished merely to point out that the stream of consciousness in which we habitually live is not our only one, and forms, in fact, only a small

part of our total personality, most of which lies below the threshold of our ordinary waking consciousness. But the subliminal part of personality is by no means "merely an unconscious complex of organic processes, but an intelligent vital control."

Modern psycho-therapeutics (mind-treatment of disease, through suggestion), as also psycho-analysis, takes for granted the dual functioning of mind, one part conscious, the other part subconscious. Hypnotism and suggestion become understandable on the hypothesis put forth by Myers, and on no other theory can we account for the phenomena involved. "By means of hypnotism the attention of the conscious mind may be distracted, and this leaves the operator free to communicate with the subconscious."

This in brief is the history of the progress from "animal magnetism" to hypnotism through purely psychical (mental) methods. It but remains to add a few words relative to the new views introduced by Emile Coué, colleague (1885-86) of Liébault, founder of the first school of Nancy, as Coué may justly be called founder of the "New Nancy School."

The originality of Coué's work consists in the fact that by his method cures are effected without resort to hypnosis or even to the suggestion of a second person. He relies entirely upon auto-suggestion, which he regards as the effective force in hypnotic suggestion. Furthermore, it is conceded by several eminent authorities that Coué has fully established the *law of reversed effort*, which is said to be operative in all cases of suggestion. Effective

auto-suggestion depends upon the elimination—or at least the partial elimination—of the conscious will. Will-power must give way to the curative—not to say creative—power of the *imagination*. “In a conflict between will and imagination,” says Coué, “the power of imagination is in direct proportion to the square of the will-power.”²

²This new theory of suggestion has recently been ably expounded by Prof. Charles Baudouin, of Geneva, in his “Suggestion and Auto-Suggestion”, translated from the French by Eden and Cedar Paul.

ories or lovely scenes, followed by an effort to make the mind as near a blank as possible. Gazing steadfastly at the upraised finger of the operator is conducive to this condition. The fixed gaze serves only as a preliminary to complete auto-suggestion, without which a deeper condition of hypnosis cannot be produced. The operator in the last analysis merely aids the subject in hypnotizing himself, the hypnosis being merely a means to an end, which is the reception of suggestions by the subconscious mind, suitable to the disease, or bad habit, for which treatment is sought.

As said previously, it is now well established that the mind is dual in character, one part being conscious and the other subconscious. Under hypnosis the conscious mind is for the time being distracted, or in a state of abeyance. In this condition the subconscious mind is open to suggestions from the operator. The suggestions being intended for the welfare of the subject, they are passively received, retained, and automatically acted upon by the individual, unconsciously.

In cases where the patient is the victim of a bad habit, the operator merely needs to suggest to the subconscious mind that the habit is extremely detrimental to the health or worldly success of the patient, and must be got rid of. The suggestions act directly upon the subconscious mind, and when later the patient is tempted to continue the objectionable habit, there comes into play a restraining impulse—an inhibition from the subconscious part of the mind. In some cases repulsion takes the place of the former desire.

Mental suggestion is successfully employed not only in the eradication of bad habits, but also in the treatment of many diseases, among which may be mentioned certain forms of insomnia, constipation, obsessions, early melancholia, paralysis, St. Vitus' dance. It is also effective in such cases as stammering, writer's cramp, stage-fright, and as a substitute for gas in dentistry, or for chloroform, etc, in some other instances where an anaesthetic would ordinarily be employed.

Professor Wetterstrand is speaking from long experience when he declares that "the palliative effect of suggestion as a soporific and anodyne remedy in serious and incurable diseases, such as tuberculosis, cancer, etc., is far too little appreciated." The great value of suggestion in every day medical practice as "an aperient, an appetizer, a soporific, and a means of regulating the digestion, the secretions and the menstrual discharge" was pointed out by Professor Forel, and, as he remarked, "is far too little realized." The method has proved of great value in the treatment of alcoholism, addiction to morphia, neuralgia and hysteria.

Some persons are not hypnotizable. Just what the percentage is who are obdurate to hypnosis is not definitely known. Much depends on the skill and personality of the operator. Experienced psycho-therapists have stated that only about one person in every ten reaches the state of deep sleep. On the other hand, Dr. Liébault, who hypnotized a great number of persons of all ages and occupations, and of both sexes, found that of 1,000 persons

subjected by him to hypnotic experiments, 460 fell into a deep trance, 223 into a very deep trance, 129 into a deep hypnosis, 30 into a light hypnosis, 100 into a light trance, and 26 remained refractory. As a rule only a certain degree of drowsiness is required for successful medical treatment.

Generally speaking, no one can be hypnotized against his will. And it should be noted particularly here that no one can ever be made to do anything under hypnosis that would be against his nature or his moral convictions when he was awake. A teetotaller cannot be made to drink alcoholic liquor, or even water that he is told is wine or whiskey; an honest man cannot be made to steal; a peaceful man to fight. A strong emotion—a deep-seated love or hatred—has more power over the subconscious mind than has any hypnotic suggestion. So considered, "Trilby," for example, is based on a pure absurdity—no influence of Svengali's could ever have made Trilby give up her love for little Billee.

Hutchison finds that "the best subject for hypnosis is the person who has the intelligence to understand what is asked of him and the ability to concentrate his mind upon it." Intelligent co-operation is a desideratum. It is all but impossible, in most cases, to hypnotize an insane person or an imbecile.

Professor Wetterstrand, a famous psychiatrist and hypnotist of Stockholm, utilizes a method of hypnosis which, it is claimed, is effective in about 97 per cent of the cases that come before him—numbering at the time 3,148 persons. He employs what may, perhaps,

justly be called *mass hypnosis*. Instead of the usual procedure of handling one patient at a time, he "hypnotizes his patients wholesale." He uses two large rooms, heavily carpeted and curtained, to prevent noise and resonance. Both rooms are furnished with sofas, reclining chairs, and also with easy chairs for patients who do not wish to recline.

Beginning his work with patients who have been hypnotized on previous occasions, he goes from one patient to another, merely whispering suggestions into each patient's ear, quite inaudible to the other patients. Those thus hypnotized at the beginning he soon awakes. By thus showing that he has full control of the situation, a feeling of confidence is produced in the waiting newcomers, who have never before been under this treatment. The very sight of so many hypnotized persons exercises an hypnotic influence on all present—a form of mass suggestion. It is then an easy matter to induce the hypnotic sleep even in those who have come for their first treatment.

In his recent work, "Suggestion and Auto-suggestion," Prof. Charles Baudouin has elucidated the new theory of suggestion offered by Emile Coué, referred to previously.

Coué, as I have already said, seems to have established the fact that we have considerable power over ourselves through *imagination*, curative results being obtained without the aid of a second person to make suggestions. In a sense, the cures are effected by hypnotism, but the hypnotism is self-hypnotism, auto-suggestion. He holds that hypnotic suggestion, and the ordinary waking suggestion made by a sec-

ond person, are merely different methods of applying auto-suggestion. The cures are effected by "creative imagination." The will in these matters is negative, and must be as far as possible eliminated. It is obstructive, not creative. If the will and the imagination are in conflict, the powers of imagination are virtually nullified. "In a conflict between will and imagination, the power of imagination is in direct proportion to the square of the will-power," declares Coué.

It is very desirable that the patient should have faith in his physician—faith in the efficacy of his treatment. But, as remarked by that experienced psycho-therapist, Dr. Albert E. Davis, the patient must take his share in combating the disease, and then he will understand that his cure had come through no other source than his own mind.

To one who has given the matter little or no study, Coué's famous formula, "Day by day, in every way, I'm getting better and better," or "My pain is passing away," frequently repeated aloud, may appear to be a fruitless, not to say foolish, procedure. But there are thousands of persons who know by experience that the method is in many cases highly efficient; not only helpful but actually curative. As Dr. Davis well points out, the message which is uttered is being conveyed to a part of the mind—the subconscious—"which is incapable of controversial argument, and constant repetition will have its effect. That mind, prior to this, has implicitly believed its possessor every time he said 'I am very ill.' Why should it not be convinced, even more by suggestions

which are in conformity with the natural desire to be strong and healthy?"³

Another very interesting development of "creative imagination" is pointed out in "Sex Antagonism," by Heape. It is generally believed among scientists that stories of pre-natal "markings" are mere superstition, and undoubtedly most of them are fancied resemblances without connection with any previous experience on the part of the mother. Nevertheless the instances given by Mr. Heape must be considered unless they can be disproved. For example, a lizard dropped from the ceiling upon the naked breast of a pregnant woman. She declared (*imagined*) that her child would be born with a mark of a lizard on its breast. It was. Again, a woman's husband returned from the war with his face slashed in the form of a cross. The woman imagined that her expected child would be born with such a disfiguring slash. The child was born with the marking on its face.

According to this school of thought, it was not *fear* that the markings would appear on the child (as is claimed by most persons who believe in pre-natal markings) that produced the resulting disfigurement; it was the result of *creative imagination*. For the woman, the marking, in imagination, had already been made. Had she taken an opposite attitude, and visualized the face and body of the infant as perfectly normal, it is most likely that no

³Albert E. Davis is Honorary Physician to the Liverpool Psycho-Therapeutic Clinic, and the author of "Hypnotism and Treatment by Suggestion", Fourth Edition, New York, 1923.

"birth-mark" would have been created,—created, as a matter of fact, by the mother herself.

Wetterstrand, Forel, Krafft-Ebing and others have shown that in certain individuals redness and swelling of the skin, and even blistering or ulceration, may be induced by hypnotism. I have myself witnessed the appearance of a white cross on a woman's forearm by auto-suggestion. There can be no doubt that the genuine cases of "stigmatization"—supposed by the faithful to be the result of a divine miracle rewarding holiness—are the effect of auto-suggestion—*imagination*. In all, some 150 cases of stigmatization have been recorded, the three I am about to mention having all occurred within the last hundred years. No scientist today regards the wounds—replicas of the injuries stated to have been caused by the nails in Jesus' hands and feet—which appeared in the hands and feet of Maria von Mörl, for example, as "faked." The same may be said of the stigmata of Katharine Emmerich and Louise Lateau. The verdict of science is that these women were hysterical invalids, not pious impostors. These wounds are, declared Professor Delboeuf, a psychologist of Liège, "auto-suggestive phenomena resulting from the intensive concentration of the attention upon the wounds of Christ." An equal concentration of the mind on the part of an expectant mother might well produce, by suggestion, any form of birth-mark on the body of an unborn infant. At least, there is no positive evidence to the contrary; although, as remarked above, most of such cases report-

ed are the result of mere superstitious credulity.

Good health, normality, if *imagined* to exist, may, within certain limits (or under certain conditions) be *created*. This at least is the doctrine of the New Nancy School. That Coué has to his credit many cures effected by his new methods of auto-suggestion is conceded by most, if not all, practising psycho-therapists who have investigated the subject.

Auto-suggestion is founded on "the great law that the subconscious part of mind governs the physical body, and in its turn is controlled by reasoned suggestions from the conscious mind. It is not even necessary that the suggestions made in the first instance should be true: they may be quite contrary to fact and apparently opposed to all reason. By reiteration the desired effect is produced, and they become true. When a person in pain persists in saying "I have no pain," or an inveterate smoker in saying "I have no desire to smoke," the one is opposed to sensation and the other to fact. The effect, however, is soon apparent; the pain lessens, and the desire to smoke is diminished."⁴

It should not be forgotten, in giving oneself auto-suggestive treatment, that pain is a *signal*. To remove pain without finding out what has caused it may be a very dangerous procedure. But as a temporary measure, or as a means of alleviation of the pain arising from an affliction already diagnosed and under treatment, it may be of great value.

⁴Davis, *Op. cit.*, Pages 50-51.

Most persons today are not averse to speaking casually of the power of mind over matter, but when it comes to a practical application of the principle they are inclined to "side-step." Yet it is self-evident that many persons increase their discomforts and ills by brooding over them. It is equally self-evident that pain and even illness can in many cases be allayed or eliminated by an opposite course—an affirmation of well-being, of health and joy.

The basis of "Christian Science" and other mind-healing cults is faith, and faith cures are not all legendary. None of them is "miraculous." Auto-suggestion, *imagination*, working on the subconscious mind, can accomplish wonders. The task of the scientist is to find out what are the *limitations* of these psychotherapeutic methods of treatment. The Christian Scientist believes that there are no inherent limitations—and dies.

CHAPTER 3.

PHENOMENA OF HYPNOTISM

Let anyone who is skeptical concerning the power of mind over matter consider even a few of the many amazing phenomena of hypnotism. Public exhibitions of hypnotic experiments were, not long ago, frequently given in this country and in Europe. The Danish hypnotist, Hansen, rolled up a considerable fortune in this way. In most of the German states, and in Holland, Belgium and Switzerland, such performances are prohibited. They should be made illegal in the United States; for, in the hands of "Professors" ignorant of either psychology or medicine, much harm can be done by such exhibitions, both to the public at large and to the participants. The showmen-hypnotists have in mind only the entertainment of audiences and are little concerned about any bodily or mental injury that may be done the volunteer subjects.

While the really important work in hypnotism and auto-suggestion is being pursued by psychiatrists (alienists) and physicians in laboratories and clinics, demonstrating "the influence of mind over matter," their results are not so obvious, so easily understood, as the spectacular performances of the showmen-hypnotists.

As a rule there is no necessity for these showmen to place "tools" in the auditorium to volunteer when requests are made for subjects

for demonstration. Among the many real volunteers who are curious to see if they can be hypnotized, it is not a difficult matter for the experienced showman to select some well suited to his purpose, though he succeeds better with some of these than with others. The unsuitable persons having been rejected, it is not long before the expert has a band of hypnotized subjects doing the goose-step behind him, utterly devoid of any impulse of their own, ready on command to perform whatever ridiculous — and therefore laughter-provoking — “stunt” he may suggest.

Limbs are stiffened and retained in any posture selected by the hypnotist, and without fatigue to the subject. Laid horizontally, the whole body may be made rigid, so that if the head be placed on one chair and the heels on another, the body forming a bridge between the two, heavy loads quite beyond the person's normal powers are readily borne by him. Certain movements of the arms or legs once begun, the subject cannot of his own will inhibit them. A needle run through a fold of the skin will cause no pain. Told that he is an orchestral conductor, the volunteer will soberly conduct an imaginary orchestra, waving the baton to and fro. Ordered to give three cheers for “the king of Iceland” three minutes after awakening, the subject will, promptly at the time suggested, suddenly break forth with the cheers for the imaginary king, though unable to account for his by now embarrassing foolishness. The same result will occur if the order is given for 243 or 2043 minutes after awakening

—the subconscious mind will keep accurate count.

These phenomena are genuine in character, and are all capable of a psychological explanation. In the cataleptic or deeper stages of hypnotism, the subject loses all consciousness of the external world, still, however, hearing and obeying the voice of the operator. On awakening he has either partially or wholly forgotten all that has occurred during his somnambulistic sleep or trance.

Psychotherapists usually designate as somnambulism the (third) phase of hypnotism wherein all that has happened during the trance is completely forgotten. The term is objectionable, however, since it is commonly applied to sleep-walking (*in somno ambulare*—to walk in sleep). For this reason Louis Satow suggests that the term *somnambulance* be applied to sleep-walking, and *somnambulism* to the deepest phase of hypnotic sleep.⁵

Hutchison regards sleep-walking as a counterpart of hypnotic sleep. As is well known, not a few persons during natural sleep leave their beds and wander about the house, or even go out into the street or climb on the roof, performing dangerous feats in a state of entire unconsciousness. Entering a room where other persons are sitting, they will answer any questions put to them, or carry on a conversation. Some undertake complicated transactions, usually those which are "most frequently in-

⁵In his excellent book, "Hypnotism and Suggestion" (translated by Bernard Miall). Page 76, New York, 1923.

cluded in the circle of their work and thought, and which concern them also in their waking moments" (Satow). Upon awakening the sleep-walker has no recollection of his actions during sleep.

Coué would explain that the somnambulist performs what are often perilous feats, usually with perfect security, because of his absence of fear; that is, he does not *imagine* himself falling from the height scaled, or the narrow board or path traversed in his wanderings. Satow says that sleep-walkers are "unaware of a large number of sensory impressions, and for this reason do not recognize danger." However, as he further observes, somnambulists have occasionally "come to grief during their perilous wanderings," as shown by authentic results. Usually, the business in hand having been accomplished, the sleep-walker finds his way back to bed, spontaneous waking during the performance being of rare occurrence.
